The three year mean on the Poudre from 1930 to 1932, inclusive, is 68% of the long time mean. The three year mean of the corrected flow of the Laramie at Woods for the same is 68% of 154,500 acre feet. The four year mean of the run-off of the Poudre for 1929-1932 is 79% of the long time mean, and on the Laramie for the same period it is 81% of 154,500 acre feet. Similarly the five year mean on the Poudre from 1928 to 1932, is 85% of the long time mean and on the Laramie is 87% of 154,500 acre feet. The six year mean from 1927 to 1932 on the Poudre was 83% of the long time mean and the mean of the Laramie for the same period is 87% of 154,500 acre feet. The seven year mean for the period 1926 to 1932 is 89% of the long time mean and on the Laramie is 90% of 154,500 acre feet. Also

the eight year mean on the Poudre from 1925 to 1932 is 86% of the long time mean while for the same period on the Laramie the mean is 87% of 154,500 acre feet.

In making the above comparison I have taken the flow of the Laramie River at Woods, as actually reported or estimated (1991) reduced by a sufficient amount of water to represent the depletion that would have resulted had the Tunnel and *and* other minor diversions equalled the full [fol. 1236] quantity of 15,500 acre feet.

By reason of the infrequency of occurrence of the unusually low years from 1925 to 1932 on the Poudre and from the marked close relation between the flow of the Poudre and that of the Laramie as evidenced by the above comparison, I would consider that the frequency of occurrence of the low years as indicated from 1925 to 1932 would be somewhat less than once in 22 years which the record from 1911 to 1932 indicates. I believe, therefore, that the mean for the period 1911 to 1932 would be somewhat below normal. This fact is also noted by the number of years during the period 1911 to 1932 when the flow was equal to or below the (1992) year 1913. The court in its opinion in the former case, found the year 1913 to have been unusually low and considered that that type of year would occur but infrequently yet in examining column 7 of Defendant's Exhibit T-3 it may be noted that the years 1911, 1919, 1922, 1925, 1930 and 1931 were equal to or below the year 1913 and that the year 1915, was only one per cent above the year 1913. Even if only the year 1931 were excluded from the series, the water supply that the Wyoming users would have received, had the tunnel and minor diversions aggregated 15,500 acre feet would have been 152,490 acre feet average for the period 1911 to 1932, or 99% of the 154,500 acre feet.

Taking into consideration the low period 1925 to 1932, and assuming that the Tunnel had been diverting its full capacity, the Wyoming users would have received during that period 134,900 acre feet per year, or 87% of 154,500 [fol. 1237] acre feet. The natural flow of the Cache la Poudre for the same period was 86% of long time mean, indicating the very unusual character of the run-off during that period. If the Tunnel in the future does not divert its full quantity for all years, that would have the

effect of raising the quantities given in column 5 of Defendant's Exhibit T-3.

(1993) The flow for none of the years 1911 to 1932 should be excluded on account of its being unusually high and therefore largely unusable. A perliminary storage study indicates that with a relatively nominal amount of storage aggregating some 150,000 acre feet, the water supply as shown in column 5 of Defendant's Exhibit T-3, could have been made to yield 154,500 acre feet per year for all of the years except 1911, 1913, 1915, 1916, 1931 and 1932. No water during the period would have been lost by spill from the reservoir. The shortages in the years 1911, 1913, 1916 and 1932 would have been nominal and negligible, while those in 1915 and 1931 would have been more severe.

When I speak of shortage, I mean an amount of water that is somewhat less than the ideal amount. Year after year in all of the irrigated regions shortages occur and in many years rather severe shortages occur. In the series of years above referred to severe shortages have occurred not only on the Cache la Poudre, but on the Arkansas and in the Rio Grande. An irrigated project, of course, cannot have a 100% water supply for all years, and does not expect to have a 100% water supply for all years. There is storage on the Laramie River in Wyoming and more reservoir sites are available and (1994) more storage construction is contemplated in that Basin.

By examination of columns 6 and 7 on Defendant's Exhibit T-3, it will be noted that there is a remarkably close relation between the run-off of the Laramie River at Woods, [fol. 1238] after the recorded flow is adjusted for full diversion by the Laramie Poudre Tunnel, and the run-off of the Cache la Poudre River at the Canyon. The means appearing at the end of the table are also very significant. The mean for the full period 1911 to 1932 of column 6 is 96% and would be about 97% if Complainant's Exhibit 35 had been used as a base. The mean for column 7 representing the flow of the Poudre for the same period is 98%. The two values are remarkably close. The mean for the period 1925 to 1932 embracing the recent period of very low run-off for column 6 is 87%. The mean for the same period for column 7 representing the run-off for the Cache la Poudre River is 86%. The flow of the Poudre is the

natural flow unaffected by uses of any sort. The flow of the Laramie at Woods as shown by column 5 is the flow after a more or less constant use has been assumed by Colorado users. If there were any items of use that had not been taken into account such as large increased consumption by the meadow lands or large unreported transmountain diversions that fact would have immediately reflected itself in a much lower supply at Woods and the fact would have been shown by throwing out of balance the indicated close relation between the flow of the Laramie at Woods corrected for the full diversions by the tunnel and the flow of the Cache la Poudre River. In (1995) other words, the mean for the period 1925 to 1932 of the flow of the Laramie at Woods after adjustment is made for full diversions by the Tunnel, would have been less than 87% of what appears to be about the normal flow under those conditions, or 154,500 acre feet. It will also be noted as a matter of fact, that since the tunnel was not making its full diversions from 1925 to 1932, the actual flow at Woods, was [fol. 1239] 91% of the 154,500 acre feet against the 87% for the Cache la Poudre River for the same period. I think that since the entering of the Court decree in the former suit in 1922, uses made by Colorado users of Laramie River water have not affected the water supply of the Wyoming users, but that the Wyoming users during that period have enjoyed the use of a mean amount of water allocated to Colorado users in amount of about 6,620 acre feet per year for the full period of 1922 to 1932.

(Defendant's Exhibit S-3 and Exhibit T-3 offered in evidence.)

Mr. Greenwood: No cross-examination.

[fol. 1240] OFFERS IN EVIDENCE

(1996) Defendant offers in evidence that part of Article XIV of its Constitution entitled "Mining and Irrigation," and being Sections 5, 6 and 7 of Article XVI of the Constitution of the State of Colorado. Defendant also offers in evidence Title 8 of the Compiled Laws of Colorado of 1921 relating to irrigation, drainage and water works districts, being Chapters 35, 36 and 37, under said title, and par-

ticularly the following numbered sections: Sections 1618, 1622, 1623, 1624, 1625, 1626, 1633, 1635, 1636, 1639, 1640, 1641, 1644, 1645, 1646, 1648, 1649, 1650, 1682, 1683, 1685, 1687, 1688, 1699, 1702, 1703, 1704, 1705, 1706, 1707, 1709, 1712, 1714, 1719, 1720, 1721, 1725, 1726, 1727, 1728, 1729, 1730, 1731, 1732, 1733, 1734, 1735, 1736, 1737, 1739, 1740, 1752, 1753, 1754, 1755, 1756, 1757, 1758, 1759, 1760, 1761, 1762, 1763, 1764, 1767, 1772, 1773, 1775, 1781, 1782, 1784, 1785, 1787, 1789, 1803, 1804, 1805, 1807, 1808, 1809, 1810, 1812, 1813, 1818, 1819, 1820, 1821, and 1822, together with amended Section 1818, as shown in the Session Laws of 1925, page 332, and in the Session Laws of 1929 at page 415. Also Section 1823, as amended in Session Laws of 1929 at page 414, abolishing the Division Engineer of Division No. 1 of the State of Colorado; Sections 1832, 1834, 1836, 1837, 1838, 1839, 1844, 1891, 1919, 1921, 1922, 1923, 1926, 1927, 1928, 1929, 1931 and 1932. We also offer Chapter 124 of the Session Laws of Colorado for 1925, being an act amending Section 1818 (1997) of the Compiled [fol. 1241] Laws of Colorado for 1921, and found at pages 332 to 334 of the said Session Laws; also, Chapter 115 of the Session Laws of Colorado for 1929, being an act concerning the office of Division Engineer of Division No. 1, being found at page 414 of said offer; also Chapter 116 of the Session Laws of Colorado for 1929, being an act relating to the installation of self-registering devices, and to amend Section 1818 of the Compiled Laws of Colorado of 1921, and being found at pages 415 to 418, inclusive, in said laws.

We also offer Title 9 of the Compiled Laws of Colorado for 1921, relating to corporations, being Sections 2238 to 2262, inclusive, and particularly Section- 2291 and 2364, inclusive.

[fols. 1242-1244] Note.—Defendant's Exhibit X-3 and Y-3 introduced on cross-examination of complainant's witness, Miss Zimmerman, are found at pages 2143 and 2144 of the transcript.

Defendant's Exhibit X-3 omitted. Printed side page 3205 post.

Defendant's Exhibit Y-3 omitted. Printed side page 3208 post.

[fol. 1245] NARRATIVE STATEMENT OF REBUTTAL EVIDENCE OF COMPLAINANT

Prepared by Counsel for Complainant State of Wyoming

[fol. 1246] (1998) The complainant offered the following evidence, in rebuttal, before E. O. Whittington, special commissioner, in the Senate Chamber of the State Capitol Building, City of Cheyenne, State of Wyoming, commencing at the hour of two o'clock p. m., July 5th, 1933.

Appearances:

For Complainant, the State of Wyoming: Honorable Ray E. Lee, attorney general for Wyoming; James A. Greenwood, Esq., special counsel for Wyoming.

For Defendant, the State of Colorado: Honorable Paul P. Prosser, attorney general for (1999) Colorado; Honorable Shrader P. Howell, assistant attorney general for Colorado; Messrs. C. D. Todd, William R. Kelly, William A. Bryans, III, and Lawrence R. Temple.

EDWIN W. BURRITT, a witness in behalf of the complainant:

Direct examination.

By Mr. James A. Greenwood:

My name is Edwin W. Burritt. I am State Engineer of Wyoming, which position I have had since July 1st. Prior to that time, I was deputy state engineer of Wyoming. I held that office from April 1st, 1933. I am not a graduate engineer of civil engineering. Prior (2000) to the time of being appointed deputy state engineer, I was a practicing civil engineer of the state.

As such State Engineer of Wyoming, I have in my possession the official records of my office. I have consulted those records recently to learn whether or not there was on file any copies of deeds conveying water rights from one piece of land in Wyoming to another piece of land, or for another use, and did not find any deeds of that kind. We examined the entire record from 1905 to 1912 on file in the State Engineer's office, and found no records disclosing a [fol. 1247] transfer of a water right from the land, for which it was originally adjudicated, to other land. Refer-

ring particularly to Sand Creek, I did not find any conveyance or transfers from one piece of land to another of water rights on that stream in this state, adjudicated under the laws of (2001) Wyoming. I find no record of any of those deeds, Defendant's Exhibits P-1 to D-2, in the State Engineer's office between 1905 and 1912.

There is not, within my knowledge, any instrument on record in the State Engineer's office purporting to show a transfer of adjudicated water rights to any one else, and for any other purpose, than the lands to which that water right was originally granted by the State of Wyoming and the Board of Control, under the name of the appropriator James Hardman, date of priority May, 1878, for irrigation, stock and domestic use—an application of .81 cubic feet per second; Peter Cunningham, date of priority May, 1885, use, irrigation, 8.65 cubic feet per second of time; the Alice Hardman, date of priority August, 1891, use, irrigation and stock, appropriation in cubic feet per second 4.57; Alice Hardman, November, 1894, use, irrigation, appropriation 1.79 cubic feet per second; together totalling 16.82 cubic feet per second of time. As to being certain of that, I would like to examine the records.

I have made a search of the records of my office to learn whether there appears there a record of a transfer of any of the water rights to which my attention has been directed, and I found a transfer of the No. 9 Enlargement, Enlargement Davis Brothers Ditch No. 2. The (2002) transfer was recorded May 13th, 1897. I did not find any other record of transfer. The transfer which I found reported in my official records, purports to be a transfer of one of the rights to which my attention was directed—No. 9 Enlargement, Alice Hardman.

Reading transfer from the record: "Miscellaneous Records No. 2, State Engineer's Office, page 196. Laramie, Wyoming, May 13th, 1897. For value received I hereby assign, transfer and set over unto Mrs. Maria Pascall all of my right, title and interest in and to the within described [fol. 1248] water or irrigating ditches known as Davis Brothers Sand Creek Ditch No. 2, and the Alice Hardman Ditch, including all rights, privileges and easements pertinent thereto, and all benefits to be derived therefrom, by

reason of the priority of appropriation of water from Sand Creek through the said ditches, when the priorities of right to use the water in said creek are finally adjudicated under the laws of this state.

(Signed) Alice Hardman. (Seal.) Witness: John H. Symons.

STATE OF WYOMING,
County of Albany, ss:

I, John H. Symons, commissioner of the United States Circuit (2003) Court for the District of Wyoming, do hereby certify that Alice Hardman, who is personally known to me to be the identical Alice Hardman whose name is subscribed to the foregoing instrument in writing, appeared before me this day in person and acknowledged that she signed, sealed and delivered the said instrument as her free and voluntary act for the uses and purposes therein set forth.

Given under my hand and official seal this 13th day of May, A. D. 1897.

(Signed) John H. Symons, Commissioner United States Circuit Court, District of Wyoming. (Seal.)

STATE OF WYOMING,
Engineer's Office, ss:

The within instrument was filed for record at 3:00 o'clock in the afternoon on the 20th day of May, A. D. 1897, and duly recorded in Book 2 of Miscellaneous Records on page 196.

(Signed) Elwood Mead, State Engineer."

I found no other record of any recorded transfer. As to whether I would say, from my search of the records in my office with reference to water rights on Sand Creek, adjudicated under the laws of Wyoming, there are or are [fol. 1249] not recorded any instruments purporting to transfer those water rights other than the one I have just referred to, I have not examined the other rights except between the years 1905 and 1912; there are no others during that time.

(2004) Cross-examination.

By Mr. C. D. Todd:

I do not know whether the ditches described in the assignment I read from Book 2, Miscellaneous Records of the State Engineer's office, as the Davis Brothers Sand Creek Ditch No. 2 and the Alice Hardman Ditch, is one or two ditches. The document I read does not describe what priority it is, and what the volume of the priority is, or anything of that kind, so as to identify it.

(2005) GEORGE WIDMAN, a witness recalled in behalf of complainant:

Direct examination.

By Mr. James A. Greenwood:

My name is George Widman. I am the same George Widman who was previously called as a witness for the complainant. I am deputy water commissioner at this time. As I previously testified, I have been water commissioner and deputy water commissioner in Districts four and five, which embraces Sand Creek.

I am familiar with the territory irrigated under the Sand Creek waters and the ditches that are taken out of Sand Creek. I know the lands formerly owned by Mr. Oda Mason, and I know some of the ditches used to irrigate those lands; I cannot recall all of the names of them, though.

(2006) That land is located on Sand Creek. I know the James Hardman Ditch, the Alice Hardman Ditch, the Leroy Ditch, and the Davis Brothers No. 2. Those ditches are used at the present time for the diversion of water from Sand Creek and the irrigation of lands, and from my own knowledge, they have been so used since I have been on as water commissioner—since 1922. I could not say whether [fol. 1250] they were used prior to that time, but I imagine so.

I have not seen the ditches this year, nor last year. I believe the last time I saw them was in 1931. They were still in use at that time. Of my own knowledge, they have

been used between the dates (2007) of 1922 and 1931. I wasn't out there every year, but I could say that the ditches were running; I had no occasion to go out there every year, you understand.

Sand Creek does not furnish ample water during the entire irrigating season to irrigate all of the lands for the appropriations that have been taken out from that creek; there is a shortage at times. The cause of the shortage is that there is just not enough water down there to go around to all the ditches, which is probably because it is used for some other purpose, or probably not enough water there; probably it could be either way. The other purposes I have in mind is the taking out of the water above through this Eaton Ditch so it would not get back to Sand Creek itself. As to that ditch being sometimes called the Divide Ditch, it is the Eaton Ditch I refer to, the one that empties into the reservoir. (2008) It diverts water from Sand Creek into an Eaton reservoir, which is in the Sand Creek watershed, I presume.

As I understand, the Eaton Ditch goes from the headgates on Sand Creek over into the reservoir, in the Sand Creek watershed, I would say. From where this ditch taps the Sand Creek water, it goes down into this reservoir, in Colorado.

I would not say that I know where Sheep Creek is, to be exact. The water from the reservoir does not come back into Wyoming; (2009) it goes down through Colorado. When it is diverted out of Sand Creek by the Eaton Ditch, it is taken from that stream and does not return to Sand Creek.

I have made a request of Mr. Eaton to release water down Sand Creek from the headgates. I made the request because the water rights in Wyoming were not getting their appropriations. I made such request on June 2nd, 1928; [fol. 1251] and again, on June 13th, 1927. I seen Mr. Eaton up at the reservoir, and the water commissioner from Colorado. In response to those requests, I could not say whether any water was released down Sand Creek past the Eaton Ditch diversion; I do not know as it was. I never went back to see—I had no occasion to go back there. (2010) I do not know whether they let the water down or not. They said they would let it down. I was never back there to check up to see whether they ever let it down.

(Complainant's Exhibit No. 91 marked for identification.)

(Photostatic copy of original field notes taken from current meter measurement on the Divide Ditch by the deputy water commissioner on June 14th, 1931.)

Complainant's Exhibit No. 91 is a current meter measurement made by me from the Divide Ditch on the 14th day of June, 1931. That is the field notes procured by my current meter measurement—the original field note of the data taken at that time the measurement was made by me. I was at that time deputy water commissioner.

Mr. Greenwood: Complainant offers its Exhibit No. 91 in evidence, and asks that a photostatic copy of the same be substituted in the record so that the original record may be withdrawn.

(2011) Referring to Complainant's Exhibit No. 91, and to a photostatic copy of the original field notes, as identified by me, the gauge heighth at the time I obtained that measurement was .95 of a foot, and the discharge was 19.93 second feet.

Cross-examination.

By Mr. C. D. Todd:

I testified before in this case. I also testified originally that I was up on Sand Creek, but not every year. I was water commissioner for eight years, and deputy for two years, being ten (2012) all told. As to whether I had any occasion to go up there to regulate the water on Sand [fol. 1252] Creek very frequently, Mr. Drummond took care of that the last two years. I was up there in June, 1927, and that was the time I met Mr. McAnnely and Mr. Eaton and asked them to turn down some water, and they agreed to do so. I do not know whether the water was turned down or not; I never had no occasion to go back. I never went back to find out whether there was any complaint.

On the other occasions, that I testified to, when I asked them to turn down some water, they agreed to do it, and I suppose they did. I never had any complaint that they did not get water—I never went back to find out.

The regulation of water on Sand Creek, by way of shutting down headgates, is just according to priority. They have headgates to (2013) shut down—the ditches I have been to had headgates. I have been to quite a few. There is no weirs on them—no way of measuring them.

I stated that I measured this ditch known as the Divide Ditch on June 14th, 1931. As to how much experience I have had in the measurement of water, I have measured quite a few ditches. I am not a regular engineer and make it a business of measuring weirs. In making up Exhibit No. 91, I handled the meter; a man by the name of Everett Lundquist made the notes. I do not know whether he is an experienced engineer; I do not know what experience he had.

(2014) In determining the measurement of my meter, I used the six tenths method. In making my measurement, if the water was a foot deep, I held the meter four tenths up from the bottom, or six tenths down from the top. I don't know whether Sand Creek in Colorado has water in it in any substantial quantity the year around; it did not in Wyoming. I don't know whether Sand Creek is dry, even when the Eaton Ditch was not drawing water, nor how late, and in how big quantities, the water runs. I was informed as to how much water Sand Creek carries only just when I was up there.

[fol. 1253] I live possibly thirty-five miles from there and did not visit very often, and only know just what I saw.

(2015) Oda Mason, a witness in behalf of complainant:

Direct examination.

By Mr. James A. Greenwood:

My name is Oda Mason. I reside on a ranch on the Big Laramie River, possibly three miles from Sand Creek, where I have resided for about nine years last past. Prior to that time, I resided on what was known as the Peter Cunningham place on Sand Creek. I resided there, I imagine, in the neighborhood of twelve years. I have lived in the Sand Creek vicinity in Wyoming since 1898 and am familiar (2016) with the Sand Creek territory, the watershed, and

most of the ranches on Sand Creek and the character of the land in that valley.

Irrigation has been practiced in the Sand Creek Valley in Wyoming, to my knowledge, since 1898, when I first seen it, and there was old ditches in before I first saw it. I know a good many of the ditches by name. I know the James Hardman Ditch. I do not believe I know any ditch by the name of the Peter Cunningham Ditch—that is the Leroy Canal. I know the Enlargement Davis Brothers No. 2, or the Alice Hardman, which is the same ditch, as I understand it; and the Enlargement of Davis Brothers Sand Creek No. 2. I am not so familiar (2017) with this Davis Brothers No. 2—I think I know it, but I am not so sure of it. I think I would know it as the Alice Hardman Ditch—if it was the same one, I would say I am familiar with it.

As to how recently I observed those ditches in the irrigating season, I saw them this last month, in June. They were diverting water at that time for the irrigation of the hay meadow. From my own knowledge, the James Hardman No. 2 Ditch, the Leroy Ditch, the enlarged Davis Brothers No. 2 or Alice Hardman Ditch, the enlarged Davis Brothers Sand Creek No. 2 have been actively used for irrigation purposes by diverting water from Sand Creek ever since 1898, [fol. 1254] up to the present year, and I know what lands have been irrigated by those ditches. I owned the Peter Cunningham place from 1907 up until 1928. I acquired it from (2018) James Hoge. I believe the title was in Mr. Bruce G. Eaton prior to the time Mr. Hoge owned it.

This Peter Cunningham land is watered by the Leroy Ditch, and during the time that I owned it, the water was never taken off or segregated from the land. Except the time of shortage when there was no water available, this land was always irrigated during the irrigation season; and the same condition would be true as to the other lands on Sand Creek, watered by these other ditches to which you called attention.

I am slightly familiar with the diversion works known as the Eaton dam and ditch on Sand Creek. I know that water is taken out of the channel of Sand Creek by means of that diversion works. As to what effect, if any, that has upon the ability to irrigate ranch lands in Wyoming on Sand Creek below the diversion works, it makes a scarcity of water ever since it has been in there. I would say there

has been a (2019) scarcity of water ever since Mr. Eaton put his water works up there, which was in the early 1900's. Prior to that time, there was not the same shortage of water; and that shortage has continued up to practically the present time.

Aside from the lands irrigated at the present time by the appropriations in the name of James Hardman, and Peter Cunningham, and Alice Hardman, of August, 1891, and also Alice Hardman of November, 1894, as to what effect the diversion of the water appropriated for these lands through the Eaton Ditch and into a foreign watershed would have upon other ranches in that valley, it would be just that much water that would not be return flow into the creek, and would have an injurious effect, I would say. I imagine there would be some evaporation, but the big part would return. In other words, I would say that the diversion of this water so that it does not return for further use in that valley, would contribute to a shortage.

[fol. 1255] (2020) As to whether, during the past ten years, there has been sufficient water in Sand Creek below the Eaton dam to mature the crops on the ranches in Wyoming in that valley, I would not hardly say so. There has been more or less of a shortage, made bad in some years, I would say, with drouth; but Mr. Eaton's diversion has hurt every year. As to that being a constant injury, I have never seen a year that Sand Creek was the same since he has been up there.

Cross-examination.

By Mr. C. D. Todd:

I stated that my name was Oda Mason; I am a son of Franklin P. Mason. I understood that my father acquired from Bruce Eaton, certain lands under Sand Creek in Sections 2 and 11 on which, by deed, the ditches were reserved. I have known all of these years that the Hardman, Hoge and Peter Cunningham lands were sold under the Leroy Ditch, the Davis Brothers Ditch and Alice Hardman and the Davis Brothers Sand Creek Ditch No. 2, to Bruce G. Eaton in the early 1900's. I understood (2021) that he deeded the lands to my father—that is, certain of the lands—and reserved the water rights. I understood that Mr. Eaton deeded Section 26, Township 14 North, Range 75 West, to James M.

Hoge, and reserved the water right pertaining to the land; it seems that everybody in that neighborhood was familiar with that fact, from hearsay. I understood that they reserved the water on these four ditches ever since up to the Eaton dam. When I acquired the land I own, I knew the water had been transferred since 1907. I did not buy it without these appropriations, I bought it with the water rights; Mr. Hoge deeded me the water rights. My abstract shows today that after he had deeded it to Mr. Eaton with the water rights and had taken it back without the water rights, he purported to deed me the water rights. When I acquired the lands, I felt that the water rights were (2022) reserved, and it has been so reserved and used ever since.

Sand Creek runs water practically every year. I have only seen it dry a time or two, and in a short period, a very [fol. 1256] short period of time. It was not dry this year; it was dry three years ago, for a short time. That, possibly, was in June, the latter part of June. I don't know whether the Divide Company was diverting any water at the time it was dry. It was dry along in 1916 or 1917, I would say roughly, in there somewhere. That does not miss the particular year very far; it was right in there close.

I know there is a difference in years in the quantity of water; I would say it was possibly a bad year for water, the year I am (2023) talking about. I do not know anything about whether the Eaton Ditch was diverting water at the time I say the creek was dry; I wasn't up there to see that. I imagine if the evidence shows that the Eatons only diverted water for two weeks in one of those years, that would indicate a very short run of water for anybody. If they were not diverting any, that could possibly be a time when there was no water up there to come to anybody. I would not say that Sand Creek has a habit of going dry at times; I have never seen this creek be what I would call exceedingly dry before Eaton came in there in 1898 and up to that time.

I was thirteen years old in 1898. I sure was observing the run of water in the creek then, and it is my recollection that there were two years when the water in the creek was so low that practically there was no water after the middle of June or the first of July. I (2024) did not say that was years when the Eatons were not running any water; I do not know what years the Eatons were not running water.

If I had made a business of hunting up these dates like you have, I would tell you what years the creek was dry. I live there, but I have a lot of things to remember besides when the creek went dry.

I would not say that we have any measuring devices in the ditches on Sand Creek for measuring the water between them. After the middle of June, we do not hardly need any means of measuring the water, because, just in my imagination, Mr. Eaton has the water. If my imagination chances to be wrong, I guess it would be wrong; I never (2025) was [fol. 1257] up there to see. As to whether I know anything about whether his ditch or the weather was the cause of the slight flow of water in the creek, I would say, from my observation from 1898 up to 1902 or 1903, after Eaton came in there, of what happened in that creek from that time on to the present date, it would have to be him that was getting the water, or somebody took it out with a bucket.

Comparing Sand Creek is a very good thing—I can watch the watershed, compare the two streams, and Sand Creek does not hold up like the river does. Sand Creek is a very short stream compared with the Laramie River, but it drops much earlier. I cannot say that it has a very small watershed; what made Sand Creek carry so much water before? As to its depending upon how much rain and snow, do you think it turned dry all of a sudden, and we did not have any rain or snow from then on? Sometimes, but I would say from 1898 it has varied, but not on the river.

Sand Creek has done very well this year. I would not say (2026) much better. I never measured Sand Creek; I do not really know what the flow of Sand Creek is, but I know when it is high and not high. I would say it done pretty well this spring, a pretty good head of water, much better than it has for three years. What I call a good head depends on the size of the stream. Some of the size of the stream depends on the snowfall and the rain, but it depends on the length of the watershed, I would say. The watershed supply this year seemed to be pretty good. It has held up well and is going pretty well. The river is holding up much better than Sand Creek; I imagine you know that.

Sand Creek does not get water from the river, but it has practically the same watershed, the same country, where a snow storm hits the two. The Laramie stream extends farther up into the mountains than Sand Creek and gets a

larger flow of water than Sand Creek—it is a (2027) bigger stream. I would not say that its going up higher into the mountains, with the natural snows and melting, it would continue to flow longer.

[fol. 1258] Redirect examination.

By Mr. James A. Greenwood:

As to my being asked by counsel as to whether, since Eaton acquired the ranches on Sand Creek with the water rights, and reconveyed them back to other parties, the water had been segregated from use since that reconveyance and these ranches are not now irrigated by waters from Sand Creek, they have always been irrigated by water from Sand Creek. There never has been any segregation of the water right from the land. These ranches have continued to irrigate just the same from the common supply in Sand Creek. They never have been shut off; it was never even questioned.

As to my being interrogated with reference to the property I purchased and whether I purchased it without a water right, I stated (2028) that I acquired it with a water right, and I have used the water each year. The land which I purchased from Mr. Hoge has not been deprived of the use of the water, or the right to divert water, since the time I purchased it, and the water right, which was originally granted to this land, has been used during all of the years that I owned the land as a basis of a right to divert water from Sand Creek. The appropriation is my authority to divert it from Sand Creek, and I have so diverted it.

I do not own the Cunningham ranch at the present time. I owned it until in 1928, so that up to 1928, the water right was used on that ranch. The same condition prevailed as to the other ranch lands to which you directed my attention, where Mr. Eaton acquired the properties (2029) and resold the land to other parties.

Recross-examination.

By Mr. C. D. Todd:

When I bought the land, I understood that the appropriations of water from the Leroy Ditch and the James Hard-

man Ditch and the Davis Brothers No. 2—Alice Hardman, and the Davis Brothers Sand Creek No. 2, with the land, had been sold, and the water rights reserved by Eaton. I imagine that Mr. Eaton and his company have been diverting that water up at the Sand Creek dam in Colorado ever since; I have never been up there to see it done. I have used the water continuously on my land since. I do not think it [fol. 1259] was some other appropriation of water; I felt it was the same appropriation. So I sold my cake and am eating it.

Redirect examination.

By Mr. James A. Greenwood:

These lands I speak of are in Wyoming, and the ditches diverting water are also taken out in Wyoming. I was asked by Mr. Todd whether I knew, at the time I purchased this land, that Mr. Eaton had (2030) reserved the water rights. I purchased this land in 1907, in June, I believe. I understood, at that time in 1907, that the laws of Wyoming did not permit the sale of a water right and the segregation of it from the land for which the water right was taken out, and that entered into my consideration in purchasing this land from Mr. Hoge. I calculated that I was protected with my water right; Hoge assured me that I was, because of the laws of Wyoming.

Recross-examination.

By Mr. C. D. Todd:

I paid a thousand dollars for the land I took from Hoge. The Leroy Canal was the ditch originally built for the Cunningham place. I do not have my deed with me. I do not own the land that Franklin P. (2031) Mason purchased from Bruce Eaton; I have never owned it. My father has owned it, but he sold it. He is living.

(2032) (Complainant's Exhibits Nos. 92 and 93 marked for identification.)

(Set of discharge measurement notes made by Goyne Drummond on July 17th, 1929, at the outlet of the Laramie-Poudre Tunnel, and set of discharge measurement notes made by Goyne Drummond on June 21st, 1932, at rating flume of the Divide Ditch on Sand Creek.)

JOHN A. WHITING, a witness recalled in behalf of complainant:

Direct examination.

By Mr. James A. Greenwood:

Mr. Greenwood: For the purpose of convenience, I will call Mr. Whiting to identify these exhibits.

I have testified in this case. Prior to April 1st of this year, I was State Engineer of Wyoming, and am familiar with the records of that office. Complainant's Exhibit No. 92 is a set of discharge measurement notes made by Goyne [fol. 1260] Drummond on July 17th, 1929, (2033) at the outlet of the Laramie-Poudre Tunnel. Goyne Drummond was a special assistant state engineer employed by me in the office at the time this record was made. It was turned into the State Engineer's office, and is an original record of that office. It refers to the water at the Laramie-Poudre Tunnel, and is a measurement of discharge of the water from that tunnel to the structure at the east portal, including the Venturi flume. The gauge height stated in that record is two feet, and the discharge, 91 second feet; it was taken on July 17th, 1929.

Complainant's Exhibit No. 93 is a set of discharge measurement notes made by Goyne Drummond, a special assistant state engineer, on June 21st, 1932, at the rating flume of the Divide Ditch, which diverts water from Sand Creek to Sheep Creek in Colorado. It is an original record in the office of the State Engineer in Wyoming. It was made at (2034) the time I was State Engineer, and under my direction. It gives the gauge heighth as 1.55 feet, and the discharge as 43.76 cubic feet per second. The date of that is June 21st, 1932.

Mr. Greenwood: Complainant now offers its Exhibit No. 92, and asks that it be received as evidence in the record with permission to substitute a photostatic copy for the original. Complainant makes a similar offer with reference to Exhibit No. 93.

You may cross-examine, if you wish. I want to call this witness later for his chief rebuttal; this was merely for the purpose of identifying these exhibits.

Mr. Kelly: The defendant objects to Complainant's Exhibit No. 92 as hearsay and incompetent, irrelevant and im-

material, and it is not shown that the record kept was one of the duties of the man supposed to have made it, and being in contradiction of the testimony of the person who is supposed to have made the record.

[fol. 1261] (2035) RALPH I. MEEKER, a witness recalled in behalf of complainant:

Direct examination.

By Mr. James A. Greenwood:

I am the same R. I. Meeker who testified previously in this case as a witness for the Complainant. I have seen Defendant's Exhibit I before and have observed what it purports to contain. The caption is "meadow lands in Colorado irrigated from the Laramie River and tributaries." The irrigated tracts are shown on the map below the Glendevy gauging station on the Laramie River and tribuaries; no irrigated tracts are shown on the map above the mouth of Nunn Creek at the Glendevy gauging station.

I heard Mr. Downing's testimony with reference to Exhibit I, and have since examined this exhibit. From my examination, and such other information as I have, this exhibit does not correctly show all of (2036) the lands irrigated from the Laramie River and tributaries in Colorado. I base that answer upon records in the annual field books of the water commissioner of District 48, of the Laramie River and tributaries, and a personal field trip in June, 1933, and also, observations prior thereto.

The extreme upper portion of the Laramie River Basin in Colorado is irrigated from the Laramie River and tributaries, but is not shown on Defendant's Exhibit I, including the Laramie River Tunnel and the Glendevy gauging station. That territory is approximately ten miles in length, and a matter of a mile or so in width, and is the south end of the valley.

Nunn Creek enters the Laramie River just above the Glendevy gauging station, from the east side. With reference to irrigated lands in that valley in Colorado, as to whether the Downing map reports any irrigated area above the mouth of Nunn Creek, referring to the legend on the

map, the meadows are shown as green, the irrigated pasture is yellow, and the irrigated sagebrush is brown, with the willows, which are not irrigated, in pink. The only color appearing above the Glendevy gauging station, above the [fol. 1262] mouth of Nunn Creek, is the pink color for (2037) the willows—no irrigated land is shown. There is irrigated land there. As to what I base that answer on, as I previously stated, upon personal observations and annual reports of the water commissioner of District 48. I last examined that valley with reference to determining the area irrigated in Colorado in June, 1933. I found ditches there diverting in that area above Nunn Creek.

On page 3 of water commissioner's field book, District 48, State of Colorado, for the year 1928, being the water district in which the Laramie River Valley in Colorado is located, is listed the Brown Ditch from Porter Creek, above the mouth of Nunn Creek. Thirty-five acres are shown as irrigated, water was used on the 1st day of May, and last used on July 25th, being a period of seventy-six days; and 334.4 acre feet were used. No land is shown on Defendant's Exhibit I as irrigated under the Brown Ditch. I have personal knowledge that the Brown Ditch is functioning and irrigating—on June 24th and 25th, 1933, that ditch was diverting water. I observed that ditch at that time, and from (2038) my observation, it had the appearance of being a ditch which has been in regular use.

With reference to other ditches, in the 1928 report, as to whether they are shown on Exhibit I and whether they are diverting water, referring to page 4, the Ben Warren Ditch, I find that 25 acres are shown as irrigated. Water was first used on May 10th, and last used on July 1st, a period of fifty-two days, 218 acre feet are reported as used. Referring to page 5, the Brinker Ditch from Brinker Creek, I find 30 acres reported as irrigated; first day water was used, May 10th, last day, July 14th, a period of sixty-five days, with 364 acre feet reported as diverted. Referring to page 33, Link Ditch No. 1, from the Big Laramie, I find 90 acres reported as irrigated; water was first used May 25th, last used July 20th, a period of fifty-two days; 800.8 acre feet being diverted, according to the report. On page [fol. 1263] 33, Link No. 2, an enlargement from Link Creek, 40 acres reported as irrigated; first day water was used, May 25th, last day, July 20th, a period of forty-three days;

309.6 acre feet being diverted. Page 35, the Charles E. Lanning Ditch from the Big Laramie, 100 acres reported as irrigated; water first used May 1st, last used June 30th, a period of sixty-one days; 292.8 acre feet being diverted. Page 36, Lanning-Springer Ditch, from the Winfred and Rapid Creeks—about 65 acres irrigated; no hay cut, used for pasture; first day water used May 10th, last day, June 30th, (2039) a period of fifty-one days, 397. acre feet diverted. Page 42, Nunn Creek Ditch, from Nunn Creek, the same land as is irrigated under Priority No. 44; no hay cut, used for pasture; first day water used May 10th, last day May 30th, a period of twenty days; 116 acre feet reported as diverted. Page 57, Springer Ditch, from the Big Laramie, no item is shown as irrigated, although the statement occurs "25 acres, no hay cut, used for pasturage." First day water used, May 10th, last day water was used June 25th, a period of forty-six days; 257.6 acre feet diverted. The total acreage irrigated from the ditches I have named, and shown by the 1928 water commissioner's field book report, is 410 acres, as read from the book. None of that 410 acres is shown on Colorado's Exhibit I as being irrigated.

Referring to page 3 of water commissioner's field book of the State of Colorado, District 48, for the year 1929, I find, with reference to a similar situation there, the Brown Ditch from Porter Creek, 35 acres reported irrigated; water first used May 15th, last used July 20th, a period of sixty-six days; 343.2 acre feet diverted. At page 4, Ben Warren Ditch from the Big Laramie, 25 acres reported as irrigated; first day water was used June 10th, last day July 30th, a period of fifty-one days; 204 acre feet being reported as diverted. At page 5, the Brinker Ditch from Brinker Creek, 30 acres reported as irrigated; water (2040) used first day May 15th, last day July 20th, a period of sixty-six days; 422.4 acre feet diverted. At page 32, Link No. 1 Ditch from the Big Laramie, 90 acres reported irrigated; water used first day May 15th, last day [fol. 1264] July 14th, a period of sixty days; 840 acre feet reported as diverted. At page 33, Link Ditch No. 2 from Link Creek, 40 acres reported as irrigated, first day water used May 15th, last day July 1st, a period of forty-seven days; 198 acre feet reported as diverted. Charles E. Lanning Ditch from the Big Laramie River, on page 35, 100

acres reported as irrigated; on June 18th, the ditch was diverting 3.2 second feet; on June 28th, 4.0 second feet; on July 10th, 7.3 second feet; on July 31st, the item occurs "check water". The water commissioner has not computed the acre feet values. On page 36, the Lanning-Springer *Ditch from Winfred and Rapid Creeks*, 65 acres reported as irrigated; water first used May 20th, last used July 24th, a period of sixty-five days; 335 acre feet reported as diverted. Page 42, Nunn Creek from Nunn Creek, no acreage reported excepting the following note, "same land as irrigated by Priority No. 44; no hay cut, used for pasture". Page 57, the Springer Ditch from the Big Laramie River, no acreage reported, with an item, "no hay cut, used for pasture", and "25" over those words; first day water used May 15th, last day June 30th, a period of forty-five days; 189 acre feet reported as diverted.

(2041) Referring to water commissioner's field book for District 48, for the year 1930, with reference to the acreage shown to be irrigated in the Laramie Valley, as contrasted with that disclosed on the Downing map, I find on Page 3, the Brown Ditch from Porter Creek, 35 acres reported as irrigated; water first used May 20th, last used July 8th, a period of forty-eight days; 172 acre feet reported as diverted. On page 5, Brinker Ditch from Brinker Creek, 30 acres reported as irrigated; no dates as to when water was first and last used, or the amount diverted; the item occurs, "no meadow cut, used for pasturage". On page 32, Link Ditch No. 1 from the Laramie River, 90 acres reported as irrigated; water first used May 20th, last used July 25th, a period of forty-eight days; there is a note, "18 days off"; 652 acre feet reported as diverted. Page 33, Link No. 2 Ditch from Link Creek, 40 acres reported as irrigated; [fol. 1265] first day used June 26th, last day July 25th; "off June 30th to July 19th"; number of days water carried, ten days; 60 acre feet reported as diverted. Page 35, Charles Lanning Ditch from the Big Laramie, 100 acres reported as diverted; May 21st no water being diverted; July 8th no water being diverted; and no record of the amount diverted. Page 36 Lanning-Springer Ditch from Winfred and Rapid Creeks, no acreage reported; May 21st no water diverted; July 8th no water diverted; and no data

(2042) given as to the water diverted; "about 65 acres, no hay cut, used for pasture".

With reference to the reported diversions of water and the irrigation of lands not shown on the Downing map, on page 3 of a similar report for the year 1931, I find the Brown Ditch from Porter Creek, 35 acres irrigated; water first used May 19th, last day May 26th; a period of seven days; 36.4 acre feet reported as diverted. On page 5, Brinker Ditch from Brinker Creek, no acreage reported as irrigated, although water was first used May 19th, last used May 26th, number of days seven; 29.4 acre feet; "no meadow cut, used for pasture"; same land under Priority No. 44. Link Ditch No. 1 of the Big Laramie, page 32, 90 acres reported as irrigated; water first used May 15th, last used July 16th, a period of sixty-two days; 744 acre feet reported as diverted. On page 33, Link No. 2 Ditch from the Branch of the Big Laramie, Link Creek, on the west side; 20 acres reported as irrigated; water first used May 20th, last used July 10th, a period of fifty-one days; 306.6 acre feet reported as diverted. At page 35, Charles E. Lanning Ditch from the Laramie River, headgate near tunnel; no acreage irrigated, and an item "no water diverted". At page 36, Lanning-Springer Ditch from Winfred and Rapid Creeks; no acreage reported as irrigated, with the note "no water diverted". At page 57, the Springer Ditch from the Laramie River; no acreage reported as irrigated, and a note "no water diverted".

(2043) Referring to a similar report for the year 1932, I find, with reference to lands reported as irrigated, and di-
[fol. 1266] versions of water from the Laramie River in Colorado, not shown by the Downing map, Exhibit I, at page 3, the Brown Ditch from Porter Creek, 35 acres reported as irrigated; water first used May 20th, last used June 15th, a period of twenty-six days; 140.4 acre feet reported as diverted; "the same land as under Priority No. 67; no meadow, used for pasture". Page 4, the Ben Warren Ditch from the Big Laramie, near the tunnel; no acreage reported, and the item "no water diverted, natural run". Page 5, the Brinker Ditch from Brinker Creek; no acreage is reported as irrigated; it says "natural run from about May 15th to June 20th, a thirty-six day period"; 187.2 acre feet reported as diverted; "no meadow cut, used for pasture; same as under Priority No. 44". At page 32,

the Link Ditch No. 1 from the Laramie River; 90 acres reported as irrigated; water first used May 22nd, last used July 30th; a period of sixty-nine days; 358.8 acre feet. At page 33, Link Ditch No. 2 from Link Creek, a branch of the Big Laramie; 20 acres reported as irrigated; water first used June 13th, last day July 30th; water carried sixteen days; and I notice the following items at the left—"May 26th, no diversion; breaks in ditch; June 13th, 2.3 second feet; June 28th, no diversion, break in ditch, off"—it is difficult to read, I think it is nine days—"July 15th, 2.5 second feet; July 19th, 2.2 second feet; July 26th, 2.44 second feet; 76.16 acre feet reported as diverted". At page 35, Charles E. Lanning Ditch from the Laramie; first ditch out of (2044) river below the tunnel; no acreage reported as irrigated; water first used June 14th, last day July 25th, a period of fifteen days water carried; 75 acre feet reported as diverted. It says "off twenty days", June 2nd, the item appears, "no water being diverted after natural run-off". Then, on June 14th, 2.0 second feet; June 15th, 2.0 second feet; July 19th, 3.6 second feet; not used on meadows, "not reaching lands". And then the item, "off meadow to use on pasture lands". This ditch was repaired before July 19th. On page 36, Lanning-Springer Ditch from Winfred [fol. 1267] and Rapid Creeks, headgate on Winfred Creek; no acreage reported; first water used about June 2nd, last day about July 16th; water carried fifteen days; 63.0 acre feet reported as diverted. Then, I see an item "off about twenty-nine days. On June 2nd, 2.5 second feet, estimate; June 14th, no water; July 15th, 2.0 second feet", as the amount of water in the ditch. Page 57, the Springer Ditch; no acreage reported as irrigated; water first used about June 2nd; last day June 16th, a period of fifteen days; 66 acre feet reported as diverted; and then, the following item —"July 2nd, 2.5 second feet; July 14th, 2.0 second feet", as the amount of water in the ditch, and, "break in ditch, no water diverted from Laramie River on account of break in ditch; about 2 feet of water in the lower end of ditch from Last Creek."

Those annual reports are prepared, and the data appearing therein is gathered by the water commissioner of Water District 48, (2045) of the Laramie River and its tributaries, who is a state official of the State of Colorado. The report for the year 1928, on page 90, is signed by Rob-

ert A. Mosier, water commissioner of Districe 48, and it has been acknowledged before a notary. I do not know Mr. Mosier's signature. Referring to the book for the year 1929, on page 90, occurs the signature of R. A. Mosier, with an acknowledgment before a notary. For the year 1930, on page 90, appears the signature, "R. A. Mosier, water commissioner of District 48", with the acknowledgment before a notary. For the year 1931, on page 90, appears the signature of R. A. Mosier, with the acknowledgment before the notary. For the year 1932, on page 90, appears the signature of R. A. Mosier, water commissioner of District 48, with the acknowledgment before the notary. These are the same reports, or official records, to which I previously testified in this case.

The Downing map, Exhibit I, shows a lesser amount of acreage in the Laramie River Valley in Colorado, irrigated from the (2046) Laramie River and tributaries during [fol. 1268] the year 1931 than is actually irrigated. Considering the fact that the official records, being the field books made by water commissioner Mr. Mosier of District 48, in which the meadow lands in Colorado and the Laramie River Valley are located, is an official report and verified and sworn to by this official, in my judgment, the water commissioner's reports would be the more accurate records as disclosing the exact number of acres irrigated in the area above the Glendevy gauging station and the mouth of Nunn Creek, for the reason that the Downing map, Exhibit I, shows no lands irrigated above that point.

Referring to the statement of Mr. Mosier, in which he said, "In view of the fact that there has been a survey of the acreage of the land, and the annual report being only estimates, I would say that during those years the reports were unreliable," in reply to the question, "Having in mind the source of your information and everything you have relied upon to make up that report, do you now consider those annual reports to be reliable, or unreliable?", I would say that Colorado's Exhibit I, the Downing map, is not a reliable source from which to determine whether the Mosier report was accurate or inaccurate with reference to the lands above Glendevy at the mouth of Nunn Creek.

Defendant's Exhibit I, being the Downing map, does not (2047) show the Lone Tree Ditch. This Lone Tree Ditch enters the Laramie River approximately three and a half

miles below Glendevy gauging station, and from the east side of the river, and is below the mouth of Nunn Creek. This Lone Tree Ditch has one of the early priorities on the Laramie River, Priority No. 28, of date October 24th, 1924, twenty-five second feet decreed. The headgate of that ditch is located in Section 11, Township 10 North, Range 76 West.

Referring to water commissioner's field book for District 48 for the year 1928, at page 34, it discloses Lone Tree Ditch from Lone Tree Creek, 200 acres are reported as irrigated; water first used May 10th, last used July 25th, a [fol. 1269] period of seventy-six days, 1033.6 acre feet reported as diverted. On May 26th, under the column "Amount of river water in ditch," 11.8 second feet; June 1st, 13.7; June 14th, 7.3; June 28th, 4.2; July 2nd, 3.0; July 17th, 1.0; 240 acres are reported that can be irrigated under the ditch.

(2048) I said that the Downing map does not show the Lone Tree Ditch. That would indicate to me that the Downing acreage reported as irrigated from the Lone Tree Ditch, in the amount of 200 acres, was not embraced in the computations of the professor in reporting the irrigated acreage—the map of Professor Downing is incomplete.

From my knowledge of the Laramie River Valley in Colorado, I would say that the acreage irrigated in that valley can be extended physically beyond the amount of 4,250 acres—the conditions are such as to permit considerable acreage of land now not irrigated to be brought in. I base that answer upon my personal examination of the area at two or three different times. I have specific data or information in mind that would permit this expansion in the way of existing ditches by possible construction.

On the area above Glendevy gauging station and the mouth of Nunn Creek, there is a considerable acreage in sagebrush lying under existing ditches that can easily be irrigated, and below the Glendevy gauging station, under the Timothy Ditch from the Laramie River, the Timothy Ditch diverts from the Laramie River on the east side about two and a half miles below the Glendevy gauging station and traverses the mesa which lies on the north side of the river and above Jimmy Creek, and there is a considerable area under that Timothy Ditch that is not now irrigated that could be readily irrigated.

(2049) Under the Stewart No. 2 Ditch from McIntyre Creek, which is now inactive, from fifty or sixty acres can be irrigated. I examined that ditch individually, I would have to look up the date, in the last two or three years, and found there was a break just below the headgate about six [fol. 1270] hundred feet or a thousand feet, which can be easily repaired, and the water commissioner's reports show that that ditch was active prior to two or three years ago.

Also, under the Forester Ditch, from Forester Creek, which ditch takes out from the left side of the creek and covers a considerable tract of raw land, this ditch is one that traverses land toward Grace Creek, and is at a distance of approximately two miles from the Laramie River, covering native land, probably four or five hundred feet above the river. And, as previously indicated, the Lone Tree Ditch covers considerable land which is not irrigated, which may be readily irrigated.

I have examined the annual reports of the water commissioner for the years 1928 to 1932, to learn whether those reports indicate and report lands that could be irrigated, as well as lands that are irrigated, and they contain such information. There are two classifications—lands irrigated, and lands that can be irrigated. The difference between the total quantities in the Laramie River and its tributaries, exclusive of Sand Creek, ranges from sixteen hundred to two thousand acres. Based upon my own personal examination, covering several trips, and based upon the water commissioner's reports also, (2050) I would state that approximately two thousand acres, and a minimum of sixteen hundred acres—not less than sixteen hundred acres—are susceptible of irrigation in the Laramie River Valley in Colorado, in addition to the 4,250 acres which are now irrigated, according to the Colorado testimony.

I stated that I made an inspection of this valley this year, on June 24th and 25th, 1933. As to what observations I made upon that inspection trip with reference to irrigation above Nunn Creek and Glendevy gauging station, I spent the afternoon of June 24th, and a considerable part of the morning of June 25th, examining the area above the mouth of Nunn Creek, up as far as the Laramie-Poudre Tunnel, [fol. 1271] and a mile and a half beyond that point. I found four ditches diverting water, and two or three ditches not diverting water. The Springer Ditch was diverting one

second foot, and the water was being applied to the land—pasture land. The Brinker Ditch was diverting approximately two second feet, and this water was being applied to the land. The Brown Ditch was diverting approximately one and one-half second feet, the water being applied to the land. The Link Ditch No. 1 was diverting four second feet, and this water was being applied to the land.

The Brinker and Brown, and the Link No. 1 Ditch, are shown on the Downing map, but the Springer Ditch is not shown. The (2051) ditches are shown, but they are not portrayed in the legend as diverting water or irrigating. The Springer Ditch, to make it clear, which exists and diverts water, is not shown on the Downing map, Exhibit I. None of the land irrigated by these ditches is shown on the Downing map—no irrigated land is shown under those ditches.

I found other ditches on this trip that were above the Glendevy gauging station, but not diverting water at that time. There is a ditch which fits the description of the Charles E. Lanning Ditch, an old ditch, now inactive, located about two miles above the headgate of the intake canal of the Laramie-Poudre Tunnel. Then, the Lanning-Springer Ditch, as is decreed, diverts from a couple of miles across on the west side of the Laramie River. No Lanning-Springer Ditch is shown on the Downing map, Exhibit I, although a Charles E. Lanning Ditch is shown three or four miles in length on the west side of the Laramie River, which is the first ditch taking water from the Laramie River below the intake of the Laramie-Poudre Tunnel, and that ditch's headgate is located approximately a half mile below the intake.

Then, there is the Ben Warren Ditch, which I visited, which is not shown on the map, and which is located on the west side of the Laramie River; and an old ditch known as [fol. 1272] the Long Park Ditch, which is inactive. I believe that covers the situation.

(2052) The Charles E. Lanning Ditch had indications of having been used recently. I noticed that particularly, because there were sacks of earth at the upper bank of the ditch at several points weher there were breaks, and where there were some fresh breaks. The indications were that it had been recently used, not only from sacks, but even from shovelfuls of dirt in the outer bank were fresh, in-

dicating that the ditch had been used within the last two years for irrigation. The Charles E. Lanning Ditch can irrigate the largest tract of land in a compact area above the mouth of Nunn Creek. There is one tract of land, which I traversed on June 25th, 1933, of at least one hundred acres, which has been irrigated and in which laterals were found, and then there are considerable areas at various points along the ditch which would indicate that amount. In addition, there is considerable sagebrush land which has never been irrigated, susceptible of irrigation.

The Lone Tree Ditch was diverting approximately one second foot of water at the time of my visit on June 25th, and the amount of land that was under irrigation, from my observations at that time, was, in round figures, forty acres.

(2053) I visited the Sand Creek, or Divide Ditch on June 25th, 1933.

Mr. Howell: We object to that—before we go into that, Mr. Greenwood, the defendant wants to object, and to move to strike all testimony of this witness, with respect to the statements that additional acres of land can be irrigated and are subject to irrigation, in addition to the 4,254 acres as indicated by defendant's testimony, for the reason that it is not rebuttal testimony, but is testimony in chief. The issue is plain, the question of acreage and the extent of acreage is set out in the complainant's complaint, and certainly are a part of the original case, and it is improper to introduce that on rebuttal.

[fol. 1273] We further object and move to strike all testimony of this witness along the line as to what may or might or possibly could be done in the future with respect to the irrigation of the meadow lands, for the reason that it is pure speculation and has no foundation upon which to base such testimony.

We object for the additional reason that it is entirely improper to introduce testimony of this kind on rebuttal.

Mr. Greenwood: I state for the record, in response to counsel's objection, that this testimony is offered to rebut the testimony of the witnesses for the defendant State of Colorado, tending to show and establish the fact that the physical conditions in the Laramie River Valley are limited to a possible irrigable area of approximately 4,250 acres of land.

I inspected the rating flume on the Divide Ditch on my (2054) visit, on June 25th, 1933, and found the staff gauge in the flume registered 1.41 feet—a considerable flow of water was in the ditch. I found heavy deposits of gravel in the upper end of the flume and in the canal just above the flume, and in the lower end of the flume, and just below the rating flume. At the left side of the upper end of the flume the gravel was 0.5 feet in depth. The condition of the flume indicated that it had been cleaned very recently. I took seven cross-sections of the depth of the water at two foot intervals, both across the ditch, above and below the rating flume, and within the flume. These cross-sections were taken at four foot intervals. A study of the cross-sections shows that gravel deposits are from 0.4 to 0.5 feet, above the rating flume in the canal, and immediately below the rating flume in the canal prism. The profile down the center of the ditch at the rating flume shows a drop in the gravel deposit in the upper end of the rating flume from 0.4 to 0.5 feet for a distance of about [fol. 1274] twelve feet, then an abrupt rise of 0.4 to 0.5 feet at the lower end. This pocket in the grade of the canal in the rating flume would fill up with gravel if the flume were not cleaned frequently.

(Complainant's Exhibit No. 94 marked for identification.)

(Cross-section in the rating flume of the Sand Creek or Divide Ditch, taken on June 21st, 1932.)

Complainant's Exhibit No. 94 is a cross-section in the rating flume of the Sand Creek or Divide Ditch, which was taken on June 21st, 1932, at the time of the meter measurement by Goyne Drummond, who (2055) testified at Page 220 of the Wyoming testimony with reference to the measurement. It is plotted from Complainant's Exhibit No. 93. The object of the graph is to show the gravel deposit in the left side of the flume at the measuring bridge. At the time, the gauge heighth was 1.55 feet, and the discharge, 43.76 second feet. This exhibit shows the gravel deposit in the flume at the left side, which is approximately three tenths of a foot in depth, and extends for a distance of four feet, and then declines to approximately no depth at seven feet.

Mr. Greenwood: Complainant now offers in evidence its Exhibit No. 94, and asks leave to substitute a photostatic copy for the original.

(Complainant's Exhibit No. 95 marked for identification.)

(Table prepared by R. I. Meeker of all the current meter measurements made at the concrete rating flume of the Sand Creek or Divide Ditch during the period of 1929 to 1933 and entered as testimony in the present case.)

Complainant's Exhibit No. 95 is a table of all the current meter measurements made at the concrete rating flume of the Sand Creek or Divide Ditch during the period of 1929 to 1933, entered as testimony in the present case. These measurements were made at the concrete flume, 10.5 feet wide, 16 feet long, and the table compares the values given by the rating table, which was made in 1922 by Mr. [fol. 1275] McAnnely, and has been used continuously from 1922 to 1933. The table was prepared by myself. Column 1 gives the dates of the measurements; column 2, the gauge heighth in feet on the staff gauge; column 3, the current meter measurement or measured discharge in second feet; column 4, (2056) the appropriate values for the gauge heighths in column 2, as taken from the 1922 rating table; column 5 gives the difference in second feet between the meter measurement and the rating table values; and column 6, the variations in per cent; column 7, the hydrographer; and column 8, a reference to where the testimony or exhibits may be found in the pending case. At the bottom of the table is shown the 1922 rating table of the Sand Creek or the Divide Ditch, which was copied from Mr. McAnnely's reports at Fort Collins by me on April 26th, 1929, and which table was entered as Defendant's Exhibit H-2 by Mr. Stimson. It should be noted that there are four extensions in the rating table made for gauge heighths 3.1, 3.2, 3.3 and 3.4 feet. These extensions were made by me on logarithmic paper.

Mr. Greenwood: Complainant now offers its Exhibit No. 95 and asks that it be received as evidence in the record.

Mr. Howell: The defense objects to the introduction of Complainant's Exhibit No. 95 for the reason that it is misleading and leaves an impression which is not according to the facts as shown by the evidence heretofore intro-

duced—namely, it purports to be a comparison or computation based upon Mr. McAnnely's rating table of 1922, while the evidence heretofore in the record discloses that McAnnely's rating table was computed only to a gauge heighth reading figure of 2.6, while the table that appears in Complainant's Exhibit No. 95 leaves the erroneous impression that McAnnely's table continued on to a gauge heighth reading of 2.7, 2.8, 2.9 and 3 feet.

We object for the further reason that while the Complainant's Exhibit No. 95 purports to be based upon Me-
[fol. 1276] Annely's rating table of 1922, as a matter of fact, as shown by the evidence heretofore introduced, McAnnely's rating table does extend and cover (2057) the gauge heighth readings 3.1, 3.2, 3.3 and 3.4, and that each and all of these figures as he referred to are computations only of the witness R. I. Meeker, and are not based in any way upon gauge heighth readings as shown by Mr. McAnnely's rating table of 1922.

For the further reason that said Exhibit No. 95 does not fairly present the condition that actually existed and is shown by the proper computations based upon Mr. McAnnelly's table of 1922.

As to whether Complainant's Exhibit No. 95 was made on the same basis and with reference to the same depth as the figures used by Mr. McAnnely, referring to my original table, copied on May 26th, 1929, at Fort Collins, in Mr. McAnnely's office, I find my rating table extends to 3.0 on the gauge, with a discharge of 117.5 second feet, and the only extensions which have been made in the rating table shown on Complainant's Exhibit No. 95 are above the gauge heighth of three feet, and are so indicated as extensions "by Meeker".

Mr. Howell: We renew our objection, as heretofore stated, to the introduction of Complainant's Exhibit No. 95.

(Complainant's Exhibit No. 96 marked for identification.)

(The 1922 McAnnely rating table of the Sand Creek Ditch, as taken from Exhibit No. 95 are plotted on logarithmic cross-sectioned paper.)

Complainant's Exhibit No. 96 is the 1922 McAnnely rating table of the Sand Creek Ditch, as taken from Exhibit

No. 95 and plotted (2058) on logarithmic cross-sectioned paper. In addition, the current meter measurements tabulated on Complainant's Exhibit No. 95 are plotted, at their proper positions against the curve, to show the deviations from the rating curve which has been used for twelve [fol. 1277] years. The right hand vertical scale gives gauge heighths in inches and foot. The horizontal scale at the bottom is graduated in second feet. The logarithmic paper has been used because, ordinarily, canal discharge clearances plot as a straight line upon logarithmic cross-section paper, and a curve extension is more easily made with a straight line than with a discharge curve on ordinary cross-section paper. Complainant's Exhibit No. 96 shows graphically the tabular data contained on Complainant's Exhibit No. 95.

This exhibit shows variations in discharge between the meter measurements and the McAnnely rating table for 1922. In 1929 the rating table showed discharges at low stages at twenty per cent in excess of the measured discharges. In 1931 the rating table values on one check meter measurement of twenty second feet, was seventeen per cent low. In 1933, on one check meter measurement of 44 second feet, the rating table was about eight per cent low. In 1933 the rating table ranges from one per cent to twelve per cent lower than the measured discharges.

Mr. Greenwood: Complainant now offers its Exhibit No. 96 in evidence, and asks that it be received as evidence in the record.

Mr. Howell: The defendant enters the same objection as heretofore entered, to the introduction of Complainant's Exhibit No. 95, to the introduction and reception of Complainant's Exhibit No. 96.

(2059) I have familiarized myself with the testimony of the witness Mr. Tipton, testifying on behalf of the State of Colorado in this case, with reference to the water supply of the Laramie River and with special reference to what he calls the close relation of the run-off of the Cache la Poudre River at the Laramie River, and have, in connection with that study of Mr. Tipton's testimony, examined Defendant's Exhibit T-3, with reference to columns 6 and 7 in that exhibit, being a table which shows the basis [fol. 1278] for the statement by the witness Tipton that

there is a close relation between the low periods on the stream flow of 1925 and 1932 on the Cache la Poudre River and on the Laramie River.

With reference to the attempted correlation by this witness of the flow between the Cache la Poudre River and the Laramie River, as shown in columns 6 and 7 of Defendant's Exhibit T-3, I found that in column 6, yearly values of depleted Laramie River flow were used, while in column 7, a seven months period of April to October, natural flow on the Poudre River was used. By "depleted Laramie River flow", I refer to the recorded flow 1911-1932 at Woods Station, which is partly depleted by the trans-mountain ditch diversions, and, in column 4, again depleted by witness Tipton to future conditions. Column 5, then, is residue flows, not natural flows, and the per cents in column 6 are artificial or fictitious. Column 7 of Exhibit T-3 is taken from column 10 of Defendant's Exhibit P-3, and the per cents in column 10 are derived from April to October flows of the Poudre River by applying (2060) the 1884-1932 mean of 299,112 acre feet to the April to October values in column 9.

By that method of comparison, values are compared that are not comparable, in one instance, the natural flow, and, in the other instance, the depleted flow. The procedure used by Mr. Tipton leads to erroneous per cents, and the use thereof to false conclusions. An effort is made to correlate the low water flow of two rivers by using the natural flow on the Poudre River for seven months, with per cents determined from a forty-nine year mean, 1884-1932, and using the depleted flow of the Laramie River full year periods with per cents determined by use of an artificial mean for twenty-two years, namely, 1911-1932.

For a correct correlation of the flow of two rivers, natural flows of the stream should be used; also, like periods of [fol. 1279] time, namely, twelve months per year, and the mean yearly flows used to determine the yearly per cents, should be based on the same period of years—in this instance, twenty-two years, namely, 1911-1932, the periods of records under consideration. When this procedure is followed on the two streams, the eight year mean, 1925-1932, on the Poudre River becomes eighty-eight per cent of the twenty-two year mean of 1911-1932, and, on the Laramie River, also using natural flow, the eight year mean, 1925-

1932, becomes ninety-five per cent of the twenty-two year mean of 1911-1932. In other words, during the eight year low period of 1925-1932, the Poudre River runoff averaged but eighty-eight per cent of the twenty-two year mean of 1911-1932, whereas on the Laramie River the actual water production was ninety-five per cent of the seventy-(2061) two year mean of 1911-1932.

When proper study and comparison is made, there certainly is no close relation of flow in these figures, one stream being 12 per cent below normal, and the other but 5 per cent below normal. The declining flow at Woods Station during the 1925-1932 year period is primarily due to increased trans-mountain diversions by Colorado ditches to the Poudre River Basin.

If further proof of non-correlation of flow is required between the Poudre River and the Laramie River, a comparison of the natural flow of the individual years of the twenty-two year period of 1911-1932 discloses a wide variation in flow between the two streams from year to year. In fourteen years of the twenty-two year period the yearly flow per cents on the Poudre River were less than on the Laramie River, the per cent variations ranging from minus 3 per cent to minus 26 per cent. In the eight years when the Poudre River yearly per cents were greater than those of the Laramie River, the yearly per cent variations ranged from 6 per cent to 47 per cent.

In 1925, the Laramie River water production was 74 per cent of the twenty-two year mean:; in 1925, the Poudre [fol. 1280] River water production was 67 per cent of the twenty-two year average. In 1926, the Laramie River water production was 117 per cent of its twenty-two year mean, and in 1926, the Poudre River water production was 129 per cent of its twenty-two year mean. In 1927, the Laramie River water production was 95 per cent of its twenty-two year mean, and in 1927, the Poudre River water production was 82 per cent of its twenty-two year mean. In 1928, the Laramie River water production was 118 per cent (2062) of its twenty-two year mean, and in 1928, the Poudre water production was 105 per cent of its twenty-two year mean. These are my own figures and study.

In 1929, the Laramie water production was 123 per cent of its twenty-two year mean, and in 1929, the Poudre River water production was 111 per cent of its twenty-two year

mean. In 1930, the Laramie water production was 78 per cent of its twenty-two year mean, and in 1930, the Poudre water production was 73 per cent of its twenty-two year mean. In 1931, the Laramie water production was 54 per cent of its twenty-two year mean, and in 1931, the Poudre water production was 57 per cent of its twenty-two year mean. In 1932, the Laramie River water production was 100 per cent of its twenty-two year mean, and in 1932, the Poudre water production was 79 per cent of its twenty-two year mean.

The wide variations in flow are due to the Poudre River Basin being located on the east slope of the mountains, while the Laramie River Basin is located on the west slope of the same range. Seldom do stream flows of the eastern slope correlate closely year by year with stream flows of the western slope. In extremely dry years, there is usually a correlation, and in extremely wet years, there may or may not be.

(2063) After careful study, I find that Colorado's Exhibit T-3 does not disclose the relation or correlation of flow of these two rivers. As to what period of time I have particu- [fol. 1281] larly studied it, generally, the period of 1911-1932, and, specifically, from 1925 to 1932. Colorado's Exhibit T-3 does not correctly show the relation between the water production of the Poudre River and Laramie River for the eight year period of 1925-1932. When the proper procedure is used in analyzing and comparing the natural flows of the two streams for the eight year period of 1925-1932, there is a wide variation. I mean by the "proper procedure," using the natural flow of both streams over the same period of time, and also, like periods of time.

Complainant's Exhibit No. 88 is a photograph of the improved Venturi flume at the east portal of the Laramie-Poudre Tunnel, showing conditions of flow on July 5th, 1932, with a discharge of close to 36 second feet, when M. C. Hinderlider, R. L. Parshall and John E. Field made three check current meter measurements. The view is looking down stream, and the picture was taken by Mr. Parshall. The photograph, Exhibit No. 88, was identified by Mr. Hinderlider at the Denver hearing.

(Complainant's Exhibit No. 88 offered in evidence.)

Complainant's Exhibit No. 89 is the original field notes (2064) of a check current meter measurement made on

July 5th, 1932, at the improved Venturi flume, east portal of the Laramie-Poudre Tunnel, by M. C. Hinderlider, with a mean gauge heighth of 1.15 feet, and a discharge of 36.52 second feet. The computations at the bottom of the sheet are the ones used, since the upper computations were only temporary in character—the rating table from Mr. Field's meter being used. This Exhibit No. 89 was identified by Mr. Hinderlider at the Denver hearing. There are two separate computations on that exhibit; we are using the lower one.

(Complainant's Exhibit No. 89 offered in evidence.)

Complainant's Exhibit No. 90 is a copy of a letter of date October 5th, 1928, from State Engineer M. C. Hinderlider to Miss Agnes Zimmerman, Home, Colorado, transmitting a blue print copy of the original field notes of a check current meter measurement at the improved Venturi flume, at [fol. 1282] the east portal of the Laramie-Poudre Tunnel, made on September 26th, 1928, by Bailey, chief hydrographer of the State Engineer's Office, Denver. The gauge heighth is 0.565, and the discharge, (2065) 11.86 second feet. Mr. Hinderlider also identified this Exhibit No. 90 at the Denver hearing.

(Complainant's Exhibit No. 90 offered in evidence.)

Mr. Howell: We object to the introduction of Complainant's Exhibit No. 90, for the reason that it purports to be a letter written by the State Engineer of Colorado to a party who is not a party to this suit, and could not bind the defendant in this case in any way, and it does not purport to be an official document or record of the State Engineer's office, and, therefore, is incompetent, irrelevant and immaterial.

Mr. Greenwood: In reply to the objection, I will state that the record discloses a stipulation to the effect that the exhibit, composed of the blue print copy of the field notes and the letter, are copies of the originals in the hands of, or in the office of the State Engineer of the State of Colorado, and the exhibit refers to the measurements of water discharged from the tunnel taking water from the Laramie River into the Poudre River, and with special reference to the accuracy of the measuring devices to correctly record the amount of water diverted by means of the device at the east portal of the Laramie-Poudre Tunnel.

Witness (Reading letter, Complainant's Exhibit No. 90):

(2066) "State of Colorado,

Engineering Department,

Denver

M. C. Hinderlider, State Engineer; C. C. Hezmalhalch, Deputy; J. Harold Baily, Chief Hydrographer.

October 5th, 1928.

[fol. 1283] Subject: Greeley-Poudre Tunnel

Miss Agnes Zimmerman, Home, Colorado.

DEAR MISS ZIMMERMAN:

Your letter of September 30th, addressed to Mr. Baily, requesting information on the Venturi Flume at the outlet of Greeley-Poudre Tunnel, has been referred to the writer for reply.

The flume in question was not installed by the writer; but was constructed under the supervision of Mr. Parshall of the Department of Irrigation Investigations. It is a 6 ft. timber structure placed within the section of the lower end of the concrete flume below the outlet of the tunnel.

Soon after installation, this flume was carefully checked and rated by Mr. Parshall and his assistant Mr. Rohwer, at which time a new gage was installed for checking the automatic register. Mr. Parshall immediately advised me of the results of his measurements, which seemed to check quite closely with the standard Venturi tables, copy of which you doubtless have. Based upon this information, the Water Commissioner was directed to use such tables in determining the amount of water discharged by the Tunnel.

(2067) There appears to be considerable variance between Mr. Baily's measurement of September 26th, when he found 11.86 sec. ft., and the standard rating tables. This discharge is for a gage height of 0.57. As a result of this measurement by Mr. Baily, I immediately called up Mr. Rohwer, assistant to Mr. Parshall, and asked him to make further investigations, which he did on the 5th inst., and reports the following:

For a gage height of 0.575, a discharge of 9.85 second [fol. 1284] ft. For this same gage height, the Venturi flume tables give a discharge of 9.93 sec. ft., which is practically a check.

We questioned Mr. Baily on the accuracy of his work, and he is unable to understand the reason for the discrepancy between his measurement and the result of Mr. Rohwer's. Due to the fact that Mr. Rohwer was instructed by me to use particular care, and had an engineer's level for checking the soundings and gage readings, I would be inclined to accept his results.

Very truly yours, M. C. Hinderlider, State Engineer.

MCH/bc."

Defendant's Exhibit H-1 is a table of current meter gaugings made on six-foot Parshall measuring flume at the east portal of the Laramie-Poudre Tunnel, Irrigation Investigations, Bureau of Agricultural Engineering, Colorado Experiment Station, cooperating. (2068) This table was prepared by Mr. Parshall and furnished the State Engineer's office at Denver. Accompanying the table was a one-page typewritten memorandum concerning current meter gaugings made on the six-foot Parshall measuring flume, and also, a picture taken by Mr. Parshall of the flume on July 5th, 1932, which has been entered herein as Complainant's Exhibit No. 88.

(Complainant's Exhibit No. 97 marked for identification.)

(Copy of memorandum by R. L. Parshall concerning current meter gaugings made on the Parshall measuring flume at the east portal of the Laramie-Poudre Tunnel.)

Complainant's Exhibit No. 97 is a copy of the memorandum transmitted by Mr. Parshall with this table of check current meter measurements, Defendant's Exhibit H-1, and at the same time he transmitted the photograph, Complain- [fol. 1285] ant's Exhibit No. 88. It bears the signature of R. H. Parshall, who testified as a witness in this case for the defendant, State of Colorado. He is also the Parshall referred to as the inventor of what is known as the Parshall Improved Venturi Flume.

That memorandum refers to the flume installed at the east portal of the Laramie-Poudre Tunnel under the direction

of Mr. Parshall. (2069) I know the signature of Mr. Parshall, from previous correspondence with him.

(Complainant's Exhibit No. 97 offered in evidence.)

Mr. Howell: Was this memorandum you refer to, Mr. Meeker, addressed to you?

The Witness: It was transmitted to me.

Mr. Howell: Was it addressed to you?

The Witness: Yes.

Mr. Howell: By whom?

The Witness: By Mr. McLaughlin. No, the memorandum itself is not addressed to me; the memorandum was transmitted in the letter addressed to me by Mr. McLaughlin, the chief of the department at Berkeley, California.

Mr. Greenwood: I object to the cross-examination of the witness, as to this memorandum at this time and move that the same be stricken out.

Mr. Howell: We have a right to examine the witness with respect to the offering of this exhibit, in order to obtain information upon which to base an objection, if we desire to make it.

Mr. Kelly: We have no objection to the exhibit. State the date of the memorandum.

(2070) The Witness: That was prepared and delivered April 14th 1933.

[fol. 1286] Mr. Kelly: I was asking the date this letter was written, which you are able to read. You gave the date that this man McLaughlin transmitted this report to you.

The Witness: Yes, it was in April.

Mr. Kelly: What I was trying to ascertain was the date the writer of that paper wrote it.

The Witness: In April, 1933; I am unable to give the exact date.

Mr. Kelly: I understood you to say it was attached to a letter.

The Witness: Yes, that is dated April 14th; that is the date of transmittal of the letter which transmitted the memorandum.

Mr. Kelly: But what is the date the memorandum was sent by Parshall to the State Engineer of Colorado?

The Witness: It has no date on it.

Mr. Kelly: Do you know when it was written?

The Witness: In April, 1933. (Reading:)

"Complainant's Exhibit No. 97

Memorandum Concerning Current Meter Gagings Made on the 6-foot Parshall Measuring Flume at East Portal of Laramie-Poudre Watershed.

This structure was built early in the spring of 1927 for the purpose of measuring the water diverted from the Laramie River through this tunnel in the Poudre watershed. The ordinary rectangular rating flume formerly used was (2071) found to be impractical because of the debris from the tunnel lodging on the floor of the flume. This trouble still persists.

Appended is a tabulation showing the results of eight current meter ratings made on this 6-foot Parshall measuring flume at the tunnel during the period 1927-1932. It will be noted that the percentage of deviation is considerable for "some of the measurements because of deposits of rocks and boulders in the approach section of the flume, as indicated by the accompanying photograph which was made July 5, 1932, showing the current all to one side and a rock barrier which interfers with the flow. The gaging made July 5, 1932, with a measured discharge of 37.06 second feet was for the identical condition as shown in the picture, the gaging section being just upstream from H. gage. This measurement shows a wide variation in the velocity across the section. Whereas, with the gaging made July 10, 1932, for the same condition, the section chosen was about three feet upstream from the crest, this giving a somewhat better distribution of velocities. [fol. 1287]

In my opinion it is asking too much of this type of measuring device to measure within practical limits under conditions imposed here because of the debris and unbalanced velocity conditions.

(Sgd.) R. L. Parshall."

(2072) (Complainant's Exhibit No. 98 marked for identification.)

(Comparative table of check current meter measurements at the Improved Venturi Flume at the Laramie-Poudre Tunnel for the years 1927 to 1933, inclusive, prepared by R. I. Meeker.)

Complainant's Exhibit No. 98 is a comparative table of check current meter measurements at the Improved Venturi Flume at the Laramie-Poudre Tunnel for the years

1927 to 1933. The exhibit was prepared by me and prepared to show the difference between the measured current meter discharges and the Venturi table discharges with variations in per cent.

Column 2 gives the dates; column 3, the gauge heighths in feet; column 4, the metered discharge in second feet; column 5, Venturi discharge table quantities in second feet; column 6, the differences in second feet between the metered discharge and the Venturi table discharge, with the plus or [fol. 1288] minus sign; the seventh column, the per cent variation plus or minus; the eighth column the name of the hydrographer, and column 9, the source of the data and information as shown from the exhibit or testimony in the pending case.

The study that this exhibit represents and the comparative (2073) compilations therein, show a wide variation in meter discharge when compared with the Venturi tabls discharge. In 1928, there was one disagreement of twenty-five per cent between the metered discharge and the Venturi table discharge, the Venturi table being low twenty-five per cent on a 12 second foot discharge. In 1929 all meter measurements, six of them, indicated the Venturi table discharges were too low, being from minus 3 per cent to minus 25 per cent. In 1930, the Venturi table discharges ranged from minus 8 per cent to plus 8 per cent, when compared against the base meter measurements. There was one exception to this statement.

No check meter measurements were made in 1931. In 1932, nine meter measurements were made. Five check measurements showed the Venturi tables to be low, namely, from minus 6 per cent to plus 18 per cent. It should be noted that three outstanding engineers used their combined efforts and experience in making three check meter measurements on July 5th, 1932, on discharges ranging from 35 to 37 second feet. The three meter measurements checked and confirmed each other and plainly show the Venturi tables give discharges too low, under conditions then obtaining, namely, from minus 18 per cent to minus 15 per cent. The predominant trend of all check meter measurements demonstrates that the Venturi table discharges are low, under conditions obtaining at the Laramie-Poudre Tunnel installation.

(Complainant's Exhibit No. 98 offered in evidence.)

Mr. Kelly: We object to the reception in evidence of Exhibit No. 98 for the reason that it includes and purports [fol. 1289] to state as evidence, measurements at the east portal of the (2074) tunnel at the Venturi flume, not shown to have been made there, and not heretofore proven. There is one purported measurement of July 17th, 1929, by Goyne Drummond, and another one purporting to have been made in July, 1922, at the west portal of the tunnel and not of the east portal, and containing at the bottom, argument not properly a part of the exhibit, and it, therefore, is misleading and not accurate and not properly based upon the testimony of the witness, and we move that the testimony based thereon be stricken.

Mr. Greenwood: In reply to the objections by Mr. Kelly, particularly with reference to containing meter measurement by Drummond at the east portal of the tunnel, not previously referred to in the record, I will state that the witness, Goyne Drummond, was called in behalf of the Complainant and testified in this case as having made that meter measurement on July 17th, 1929, and the official record disclosing the data showing that measurement was identified and received in the record this morning.

Mr. Kelly: Of course, our objection to that is also to the effect that it includes the objection to Goyne Drummond's measurement as not being an official record and as only hearsay, and not supported or explained by the witness.

(Complainant's Exhibit No. 99 marked for identification.)

(Discharge curve for the Improved Venturi Flume at the east portal of the Laramie-Poudre Tunnel, plotted by R. I. Meeker on logarithmic cross-section paper.)

Complainant's Exhibit No. 99 was prepared by me and is the discharge curve for the Improved six foot Laramie-Poudre Tunnel (2075) Venturi flume, at the east approach, or east portal, which has been plotted on logarithmic cross-section paper. The curve is plotted from data [fol. 1290] contained in Complainant's Exhibit No. 56, the published Venturi table discharges of the State Engineer's Office, at Denver, Colorado.

The check current meter measurements found on this Exhibit No. 99 are plotted in their proper locations and against the curve, or the straight line relation there. The

logarithmic cross-section paper is used to delineate the curve for the reason that disagreements between a straight line and plotted meter measurements can be more readily compared and studied than a curved line discharge curve.

The object of this exhibit is to show graphically the relation between the check meter measurements found on Complainant's Exhibit No. 98 and the Venturi discharge tables used at the Laramie-Poudre Tunnel installation.

As to the two special notations indicated on Exhibit No. 99 by arrows, referring to conditions at the flume on July 11th, 1929, and July 5th, 1932, photographs were taken on the dates in question, and have been entered as exhibits, and show conditions resulting from rock debris deposits in the converging section of the flume and in the approach channel at the time of the measurements to which the arrows point, showing conditions as to the heavy grade of the water as it approaches and enters the flume, and also the unbalanced velocity conditions due to the main current being deflected to either side of the flume by rock deposits in the flume proper, and in the approach channel.

(2076) Complainant's Exhibit No. 57, which applies to the Meeker-Drummond meter measurements of July 11th, 1929, was taken by me. Complainants' Exhibit No. 88, which applies to three current meter measurements made by Hinderlider Parshall and Field on July 5th, 1932, was taken by Mr. Parshall.

(Complainant's Exhibit No. 99 offered in evidence.)

Mr. Kelly: We make the same objections to Complainant's Exhibit No. 99 which we made to Exhibit No. 98, on which Exhibit No. 99 appears to be based, in that it purports to contain measurements not properly here proven, including the purported measurement by Drummond in [fol. 1291] July, 1929, and a purported measurement at the east portal in July, 1932, and a purported measurement of July, 1929, which was shown by the State Engineer to be wrong, and, therefore, it is based upon hearsay and not upon facts proven in the record. We also move that the testimony of the witness as a conclusion based upon this exhibit, should be stricken as not based upon any evidence in the record or facts that are there proven.

I made an observation or study with reference to the velocity of flow of the water passing through the Venturi

flume and in the approach channel at the east portal of the Laramie-Poudre Tunnel on June 24th, 1933, and Mr. Whiting assisted me. As to the quantity of water passing through the flume at that time, I am unable to give the exact discharge based upon the meter measurement. We were at the flume three hours and the approximate discharge ranged from 80 to 70 second feet, according to the Venturi tables. The staff gauge in the stillwell (2077) at the automatic gauge, registered 2.11 feet at 8:45 a. m., at the flume, and 1.95 feet at 11:15 a. m.

As to the conditions prevailing at the flume at the time of this study on June 24th, 1933, as to whether there was rock debris in the approach channel and in the Venturi flume, or in either of them, the so-called stilling pool above the right angle turn was over half clogged with gravel and rock deposits at the left side, confining the flowing water to a narrow, deep channel, with excessive grade, along the concrete wall to the right. In the concrete approach channel to the Venturi flume, a large rock bar had formed along the right side of the channel and extended for a distance of twenty-two feet, deflecting the flowing water chiefly along the left side of the approach channel. This rock bar extended ten feet down into the converging section of the wooden portion of the Venturi flume to a point six feet above the throat of the flume and just above the enamelled staff gauge on the right side. The rock bar obstructed one-
[fol. 1292] half of the cross-sectional waterway in the converging section of the Venturi flume. The rock debris varied from small cobbles to rocks six to ten inches in diameter.

I made velocity observations on June 24th, 1933, at six points between the tunnel mouth and the Venturi throat, and found the following surface velocities—or, if not surface, they will be otherwise designated: at the left side of the tunnel outlet, as water emerges from the tunnel, one-third width of the channel near surface, 8.70 feet (2078) per second. That is the velocity in feet per second.

At the left side of the center of the main current, just above the right angle turn, at a point about one-third of the width of the water channel and near the surface, 5.10 feet per second. Another observation at the left side of the main current, opposite the offset in the concrete wall on the right side and below the right angle turn, at a point one-

third of the width of the channel near the surface, 3.80 feet per second.

Again, an observation in the main current along the left side of the channel, at the upper end of the Venturi flume, two feet from the left side, depth of water 2.4 feet, with 0.6 velocity observation. Only half of the channel at this point is active due to the rock debris bar. The velocity was 5.90 feet per second. At the main current along the left side of the Venturi flume, 1.5 feet above the crest, at 0.6 depth, velocity observation 7.20 feet per second. I also took a velocity observation on the right side of the Venturi near the wall, 1.3 feet above the crest. This observation was both by the two-tenths and eight-tenths method, with a mean, giving 4.90 feet per second as the velocity.

The importance of the last two velocities is to show the unbalanced or non-uniform flow of water through the throat of the flume. For example, on the left side of the flume, the velocity at 0.6 depth was 7.20 feet per second, and on the right side, 4.90 feet per second, a difference of 2.3 feet per second between the velocities in the flume at the throat; and [fol. 1293] those velocity observations were obtained at practically the same time, starting up at the portal and working down, and using a (2079) current meter. They were all made within fifteen minutes.

(Complainant's Exhibit No. 100 marked for identification.)

(Six photographs showing flow conditions at the Improved Venturi flume of the Laramie-Poudre Tunnel taken by R. I. Meeker on June 24th, 1933.)

Complainant's Exhibit No. 100 consists of a series of six photographs taken by me at the time I was making this study on June 24th, 1933, with the caption "flow conditions at Improved Venturi Flume, diversion quantities approximately 80 to 70 second feet, by R. I. Meeker, June 24th, 1933."

The photographs are six in number, numbered from 1 to 6, and are arranged progressively in order down stream to show the conditions in sequence. No. 1 shows the water emerging from the tunnel; No. 2 shows the right angle turn and the gravel and rock bar in the so-called stilling pool; No. 3 shows the outlet channel between the tunnel outlet and the upper end of the Venturi flume; No. 4 shows clearly the

excessive grade in the water channel between the tunnel outlet and the Venturi, and also, the rock and gravel bar which obstructs a large part of the so-called stilling pool at the left; No. 5 is a close view of the turbulent water as it enters the approach channel to the Venturi flume, and the location of the rock bar on the right side of the approach channel (2080) and in the flume; No. 6 is a close view showing the turbulent condition of the water as it enters the Venturi flume, with the rock bar on the right side and the main current at the left.

(Complainant's Exhibit No. 100 offered in evidence.)

Mr. Kelly: We do not object to the exhibit, but do object to the argument of the witness concerning it.

Mr. Greenwood: As shown by the exhibit?

Mr. Kelly: We object to his descriptive testimony.

[fol. 1294] The conditions in the approach channel and in the Venturi flume on June 24th, 1933, were not favorable to the accurate measurement of water, for the following reasons: the grades in the approach channel and Venturi flume were excessive and the water turbulent; the channel in the upper end of the Venturi was constricted approximately fifty per cent, as determined by soundings. Roughly, one-half of the cross-sectional waterway, along the right side of the Venturi flume, was obstructed by a rock bar which extended down to within seven feet of the throat. A non-uniform flow of water entered the flume throat. The velocities on the two sides of the flume were unbalanced, being 7.2 feet per second on the left side of the flume, and 4.9 feet per second on the right side of the flume, at a depth of 0.6, and at a cross-section 1.5 (2081) feet above the crest at the throat. Debris conditions in the approach channel and converging section of the Venturi are constantly changing with fluctuations in the discharge of water and debris from the tunnel.

As to how I evaluate the present installation of the Improved Venturi Flume as now installed at the east portal of the Laramie-Poudre Tunnel, basing my statement upon conditions observed on field trips, on conditions shown in photographs entered as exhibits, and upon an analytical study of thirty-two current meter measurements made during the seven year period from 1907 to 1933, I am forced

to conclude that the installation is not properly located. Conditions are too adverse to expect dependable results.

Rock debris is a continuous source of trouble, changing waterway areas, both above and within the flume, changing water gradients, both above and within the flume, and causing unbalanced velocities and unduly high velocities in the upper part of the flume and at the throat of the flume. This measuring device cannot successfully combat such changing conditions, such adverse conditions, and measure water accurately.

[fol. 1295] The present installation is not satisfactory as a measuring device and does not accurately measure the water diverted from the Laramie River. Undoubtedly check tests can be made by cleaning the rock debris from the flume, whereby the device is enabled to function within practical limits, but conditions during such test periods are not representative of prevailing conditions during the diversion period, nor such as Mr. Parshall states, in Bulletin 336, Page 32, Colorado Experiment Station, Colorado Agricultural College, Fort Collins, Colorado, must be maintained to permit this measuring (2082) device to properly function.

Referring to the approach channel to the Improved Venturi flume at the east portal of the Laramie-Poudre Tunnel, as to whether the same general channel conditions which I observed on June 24th, 1933, would prevail at and following high water periods of future years if the present installation continues to be used, similar conditions did prevail in July, 1929—see Complainant's Exhibit No. 57. In July, 1932, at the time of the Hinderlider-Parshall-Field check meter measurements—see Complainant's Exhibit No. 88—rock debris is the chief source of trouble, and in future years, with the present installation, the rock debris conditions will continue to persist.

I am familiar with the inlet canal at the west portal of the Laramie-Poudre Tunnel, having examined it several times and measured water in it many times. It is about one-fourth of a mile in length from the Laramie River to the west portal. I have observed the channel flow conditions in that portion of this ditch or canal, and have made photographs of those channel conditions; I took several on June 25th, 1933.

(2083) (Complainant's Exhibit No. 101 marked for identification.)

(Three photographs of the inlet canal at the west portal of the Laramie-Poudre Tunnel taken by R. I. Meeker on June 25th, 1933, showing the channel flow conditions.)

[fol. 1296] Complainant's Exhibit No. 101 contains three photographs, numbered 1, 2 and 3, which were taken by me at the time I just testified to, as showing the condition of the channel at the west portal of the Laramie-Poudre Tunnel, between that point and the intake. As to what these photographs indicate as to the condition of the water in the canal as to whether it is in a disturbed condition, or otherwise, pictures 1 and 2 show very even conditions of flow; picture 3 shows the last three hundred feet of the inlet canal and just as it enters the west portal.

The photographs are arranged in order down stream. No. 1 shows the old stillwell house in the inlet canal and a section of the canal immediately below, where there was an old rectangular rating flume. Photograph No. 2 is in the opposite direction, from the same point that No. 1 was taken, looking down the canal to the west portal of the tunnel, and again, we have excellent conditions of flow. No. 3 shows the constriction in the rock debris cut about three or four hundred feet from the west portal. Photograph No. 1 was taken looking toward the west.

As to my statement that, from my point of view as an engineer, the Venturi flume installation, where it now is installed at the east portal of the Laramie-Poudre Tunnel, is unsatisfactory as a (2084) measuring device, there is a solution to this unsatisfactory condition whereby a Venturi flume or other proper measuring device could be installed to overcome conditions which I have testified make the east portal an unsatisfactory location.

There is an excellent location in the inlet canal, where the conditions are favorable for the measurement of water, for the installation of a rectangular, or a Venturi flume, and this can be made without much cost. Conditions in the inlet canal are favorable to the accurate measurement of water. The canal grade is uniform for long stretches, the cross-section of the waterway is regular, and no rock debris problem, with continually changing conditions such as you have at the east portal, confronts the operation of a rating

[fol. 1297] flume in the inlet canal, if properly located. Neither are there excessive grades or right angle turns in the inlet canal. In fact, a gauge installation in the canal section, without a rating flume, and occasional current meter measurements, should give results far superior to those now secured at the east portal. The cutting of a few trees along the canal bank, and the removal of some rock debris in a short constricted section of the canal just below the old twelve-foot Venturi flume, about four or five hundred feet above the west portal of the tunnel, would suffice. A measurement crew of the company is located at the west portal, and that would simplify the problem of installing a new measuring device in the inlet canal.

Variations from ten to twenty per cent in the measurement of water in canals for irrigation purposes, are not permissible in engineering practice. Those variations are too wide, and water is too (2085) valuable. The appriators on a river could rightfully object to any such wide variations from the actual quantities. Variations of from five to ten per cent would not be permissible as a general thing, although they do occur under certain conditions where the channel is shifting from silt deposition. Within the limits of practical measurements, two or three per cent variation, ordinarily, would be allowable or permissible, and not over five per cent, and, for this reason—a measuring flume is located in a permanent section, or is a permanent section, in the canal, and after a rating table has been prepared, check meter measurements, if properly made, would ordinarily fall within two to three per cent, and not over five per cent.

I visited the Laramie-Poudre Tunnel diversion works at the east portal—the flume—on April 16th, 1933. As to whether there was water being diverted from the Laramie River to the Poudre River at that time, referring to my original field notes of April 16th, 1933, I found that 3.83 second feet were being discharged through the Venturi Flume, which was water diverted from the Laramie River. [fol. 1298] I inspected the gauge house at that time to ascertain whether the automatic (2086) gauge was recording the diversion and found that it was not operating. I did not find any evidence of the discharge, then occurring from the Laramie River to the Poudre River, being meas-

ured or recorded by the automatic gauge, or any other evidence of a record being taken.

I have examined the weekly reports of the water commissioner of District 3, on file in the State Engineer's Office at Denver, for the year 1933. I observed from that examination of those reports the first date in 1933 when there is a report of water being diverted, which was on May 8th, 1933. I referred to the weekly reports from the water commissioner of District 3, on file with the State Engineer, and the first report, which is marked No. 1, was dated May 6th, and that is the first record of water being diverted by the Laramie-Poudre Tunnel in 1933.

The report was that the tunnel had diverted water for four days, namely, from May 3rd to the 6th, and the average flow was 5.7 second feet. I later referred to the reports, and they followed in sequence, Numbers 2, 3, 4, and so forth, to satisfy myself that I had the first report. They were so numbered, 1, 2, 3 and 4; so whatever water was diverted between the date of April 16th, 1933, and the first reported diversion by the chart, so far as the records I examined in the State (2087) Engineer's Office are concerned, was unreported water. There was water being diverted prior to April 16th, 1933, by the tunnel, as evidenced by the conditions I observed in the inlet canal. In other words, this 3.83 second feet did not start running, in my judgment, on the morning of April 16th, because the canal had not been cleared of snow; that amount of water was the gradual development, from a much lesser amount, up to that time.

Mr. Kelly: We object to that as argumentative, leading, repetition of testimony of the same witness on the case in chief, and not proper rebuttal, and we move that all of this line of testimony as to April 16th be stricken as not proper rebuttal.

[fol. 1299] Mr. Greenwood: It is offered for the purpose of showing, as alleged in the bill of complaint, that the devices installed for the measurement of water in transmountain diversion from the Laramie River to the Poudre River do not accurately record all of the water so diverted.

Mr. Kelly: We move to strike the answer as pure hearsay and guesswork.

Mr. Greenwood: I will state further that the testimony is offered for the purpose of showing that the defendant,

State of Colorado, does not accurately operate the installed devices for measuring water diverted from the Laramie River to the Poudre River.

(2088) Referring to Defendant's Exhibit J, being certified copy of map of the proposed Laramie tunnel ditches and feeders, by the Larimer County Reservoir and Irrigation Company, as filed in the United States Land Office, showing the right-of-way applied for and which was approved March 29th, 1909, I find, referring to the West Side Collection Canal, herein designated the Lower Supply Ditch, 4.28 miles in length, commencing at Mill Creek, and approximately opposite the tunnel line, west portal, in Section 6, Township 8 North, Range 75 West, Sixth Principal Meridian. I have given the original, oldest right-of-way location for the West Side Collection Ditch.

Referring to the map of the amended survey of the partially completed portion of the Laramie tunnel ditches and feeders, I find this map, which was approved on May 5th, 1924, by the Secretary of the Interior, shows an amended location of the West Side Collection Canal—first, the tunnel portal has been moved one mile up stream from the Northwest Quarter of Section 6, to the Southwest Quarter of Section 7, Township 8 North, Range 75 West, and the canal line, the (2089) Lower Supply Canal, or West Side Collection Canal, has been extended from Mill Creek up to the west fork of the Laramie River a distance of approximately [fol. 1300] one and a half miles.

There is a considerable difference in places between the original location and the amended location of the Lower West Side Collection Ditch, in some instances, as much as a quarter of a mile, and then, in other instances, the lines are approximately the same as to the physical location on the map. As to the elevation, the grade elevation, I cannot determine that from this exhibit. With reference to the south end of the West Side Collection Ditch, as previously indicated, the original survey terminated at Mill Creek; the amended survey extends up the valley of the Laramie River, but on a descending grade, approximately a mile and a half.

According to the exhibits, the West Side Collection Ditch, or Lower Supply Ditch, is not constructed on the identical original (2090) location. As constructed, it extends for approximately a mile and a half farther down

toward the west branch of the Laramie River than the original location called for.

Examining automatic gauge chart of the Laramie-Poudre Tunnel for the week of June 11th, 1927, which appears in the record as Defendant's Exhibit I, I find the notation on June 16th, "gauge corrected 0.16 feet, by Parshall", with an arrow pointing to the pen line at about 2:10 p. m. As to whether that notation, placed thereon by Mr. Parshall, indicates that the correction is to extend to any other chart taken from the automatic gauge register in the Laramie-Poudre Tunnel, with reference to a similar error and for the purpose of correction, from my experience on handling automatic charts, I did consider that that note applied to the chart for the week of June 11th-18th. The note is inadequate as to corrections for charts prior thereto, but, ordinarily, it is customary, if the gauge has been corrected, to clearly state that prior charts should be corrected. That correction there was really a correction of the gauge staff. The gauge staff was raised .16 of a foot, and the pen was dropped approximately .16 of a foot.

[fol. 1301] (2091) As to Mr. Parshall's testimony in this case that careful observation of that notation would have indicated a similar correction on weekly charts taken off that same register for the preceding weeks in 1927, I examined those charts for the preceding weeks in, I think it was, the month of March of the present year; there was no correction, and I think there is no such correction now. I find no specific notes on the charts prior to June 11th, 1927, and up to the time of the installation of the Venturi flume, stating that these charts should be corrected for the change in the gauge. I do find that some gauge heighths have been entered on the charts, since I first examined them, and a correction of .16 has been applied to them.

With reference to that additional information that has been entered on these charts in the way of new gauge heighth, I have talked with some one in the State Engineer's office of Colorado, where these records are kept, with reference to when that additional information was placed thereon. I reviewed these charts again in the State Engineer's office, I think it was the latter part of May, and found these changes. I asked the office force whose figures

they were, and they sent me to Mr. McGraw, one of the hydrographers. I talked with him and he said (2092) that he had done some work on these charts, I think, within a period of ten days or two weeks, or such a matter —on these and other charts, and he had entered the corrected gauge heights and computed the mean gauge charts. I believe these corrected gauge heights were placed thereon after my first examination of these records, and after my testimony with reference thereto in this case.

Mr. Howell: We object to the witness testifying to a conversation between himself and some other employe of the engineer's force. The charts have been introduced in evidence, and they speak for themselves. He testified there was a correction made there, and it appears on the chart.

Mr. Greenwood: This testimony is offered for the pur- [fol. 1302] pose of showing that this witness, in the original examination of these charts, was not careless and overlooked the notations, which the testimony of Mr. Parshall was intended to imply was there at the time of the original examination.

Mr. McGraw is a hydrographer in the State Engineer's office at Denver, an employe in the State Engineer's office.

Mr. Howell: We object further to any statement made with respect to the conversation with some employe of the State Engineer's office, for the reason that it is improper rebuttal. The charts were introduced and that was gone into (2093) by the complainant on its main case.

Mr. Greenwood: In reply to the objection, I will state that it is for the purpose of showing, as alleged in the bill of complaint, that the records kept by the State of Colorado with reference to discharge of water in the trans-mountain diversions from the Laramie River, are not accurate and are not to be relied upon; and with reference to the particular record, to which the witness just testified, that the change was made after the case was commenced and after this witness testified in chief in this case.

Cross-examination.

By Mr. William R. Kelly:

I talked with Mr. McGraw in May and found that he had worked up these automatic register charts on the Laramie-Poudre Tunnel. As I understood him, he worked up the

mean gauge heighth for each day, and then applied a correction of .16. He had made these pencil notations on the register charts some time in May, and he had originally done it on the one chart, on which the partial note was found, and then he later found there was some disagreements, and I think, got information from Mr. Parshall, as I understood it, and then was able to apply (2094) the correction back. It was all done in connection with his [fol. 1303] operation in working up the actual gauge heighths for the period prior to the 16th, and was done as a part of the same operations on, I think he said, May 11th. It did not change the pen lines any on the days prior to June 16th. I could not have done the same thing myself from the one chart; the note was adequate for the week for which it was entered by Parshall, but not adequate for the prior charts. I did not consider it so; it did not specify, except that it should be applied to prior charts.

I have heretofore testified on the case in chief regarding the present location of this West Side Collection Ditch. As to my claiming that any portion of the ditch is located any differently now from what I found it constructed in 1913, except that portion at the lower end where it goes to the west portal of the tunnel, in 1913, the construction work ended at a point opposite the old concrete conduit in the channel of the Laramie River, in the tunnel reservoir.

I introduced some photographs of the line of the ditch as (2095) I found it in 1913, and as I photographed it. That is the same line on which the ditch now runs, but not the same line as the original right-of-way map, Defendant's Exhibit J. The original map, that I referred to, I believe shows the original locations, with amendments of the constructed portions. I take it that that map was made some years prior to its actual approval, because it takes several years to get them through; and that is true of the amended, or constructed location map, the last one.

I believe the West Side Collection Ditch does use the tunnels that I saw in 1913, and as far as where the ditch commences is concerned, Station 1 on both location maps, Exhibit J, is at Rawah Creek, but the construction stakes I observed in 1913 were from the lower end of the ditch up the ditch, because I have referred to my notes and studied that particular feature.

I testified in the case in chief regarding being at the [fol. 1304] east portal of the tunnel on Easter Sunday,

1933. I believe I was at (2096) the west portal the day following, or the day prior; it was the day either just before or just after.

Referring to Complainant's Exhibit 100, photographs taken by me at the east portal of the tunnel showing some gravel or debris lodged, and particularly to the one numbered 5 where I pointed out one with an arrow and designated it "rock bar," with the changing conditions there, it is difficult to name the length of time that — had been in there; I do not feel I am competent to name the time that — had been in there, with what information I gleaned on my trip. As to whether it looked to me as if it had risen that morning, I am unable to answer that question, Mr. Kelly. I am pretty good at observing water action, but I do not think I would be warranted in going to that extremity. I would not call it a permanent condition; there is a changing condition in the approach channel and in the flume. The rock debris varies and moves with the fluctuations in the water. I think it was probably there the day before. I was there for about three hours that day; we reached there a quarter of eight in the morning.

(2097) I went to the Skyline weir that day, on the way over to the Laramie. I did not make a meter measurement of that; I was at the Skyline weir just a matter of three or four minutes, about noon—it may have been a few minutes after. That night, I stayed at Atmoore Lodge, or Glendevy postoffice. The following day, I was in the Laramie Valley until about eleven o'clock, and then I went to Sand Creek, or Divide Ditch. I did not go to the Deadman headgate.

As to whether, in developing my tables of the flow of the Laramie River and of the Little Laramie River, Exhibits 50 and 51, and the other tables and exhibits based upon those, I found that there has been any substantial change in the uses of the water on the Little Laramie River above Fillmore since 1911, I did not go up to investigate that feature. I do not think there have been any substantial changes, but I did not go up and investigate it. In making [fol. 1305] a comparison, however, with the flow on the Laramie River proper, or the Big Laramie River, I did not take into consideration any changes in the developing or (2098) increasing diversions from the Laramie River proper, because the period in question was very recent on the Laramie River for which I wanted to extend the records.

I did not make a personal investigation of the lands being irrigated in the Laramie River Valley in Colorado, above Glendevy gauging station for the years 1931, 1930, 1929 or 1928. As to my saying that in June of this year, I found one ditch above the Laramie-Poudre Tunnel, in the Laramie River Valley in Colorado, which was unnamed, I said it fitted the headgate description of the Charles E. Lanning, I think it was. I found that ditch was inactive; it was not diverting water this year. The Ben Warren Ditch was not diverting water at the time I was there this year. As to there being any hay cut this year, or in 1932, above Glendevy gauging station, there would not be any cut this year, because it is too early; I could not answer that in the affirmative for 1932.

(2100) JOHN A. WHITING, a witness recalled in behalf of complainant:

Direct examination.

By Mr. James A. Greenwood:

I am the same John A. Whiting who previously testified in this case. I visited the meadow lands of the Laramie Valley in Colorado on June 24th and 25th, 1933, in company with R. I. Meeker, a civil engineer of Denver, Colorado. That was my last trip up there; I have been there previously.

I observed upon this trip, with reference to the meadow lands, as to the existence of ditches and things generally, the Springer, Brinker Creek, Brown, Ben Warren, Link Ditch No. 1, and Lone Tree Ditch. I found the Springer Ditch, the Brinker Creek Ditch, the Brown, and Link No. 1 Ditches were diverting water on June 24th, when we visited them. The Link No. 1 Ditch and Lone Tree Ditch were diverting water on June 25th. The Ben Warren Ditch was not carrying water on the day of my visit. The water so [fol. 1306] diverted was used for irrigation purposes. The Springer (2101) Ditch, Brinker Creek Ditch, Brown Ditch and Lone Tree Ditch were diverting water to lands used for meadow or pastures, and which bore evidence of long irrigation. I did not visit the lands irrigated by the Link No. 1 Ditch. There was water being diverted by the

ditch, and Mr. Moore, the lessee of this ditch, stated that the water was being used for irrigation purposes.

I have observed Defendant's Exhibit I. It shows all of the ditches I have mentioned, excepting the Ben Warren Ditch on the west side of the Laramie River Valley, opposite Brinker Creek, and the Lone Tree Ditch, diverting water from Lone Tree Creek in Section 11, Township 10 North, Range 76 West. The map shows none of the lands on the ditches mentioned as irrigated from the Laramie River and tributaries. Assuming the acreage that Mr. Downing shows as irrigated is correct, then his map, Defendant's Exhibit I, does not correctly represent the actual conditions (2102) in the field of the ditches mentioned. The acreage irrigated by the ditches to which I have just testified as Springer, Brinker Creek, Brown, and Link No. 1, and Lone Tree, would increase the acreage he states as being under irrigation. I believe that these ditches and the appropriations of water decreed to them, are in constant use.

I last visited the Divide, or the Sand Creek Ditch, on June 25th, 1933, in company with Mr. R. I. Meeker, of Denver, Colorado. As to the amount of water I observed being diverted at that time through this ditch, the staff gauge in the rectangular flume read 1.41 feet, which, when compared with Defendant's Exhibit H-2, being McAnnely's rating table for the Divide Ditch flume, gave a discharge of 33 cubic feet per second, as being taken from Sand Creek by the Divide Ditch on June 25th, 1933. At the time of this visit, I observed the conditions of the rating flume and the ditch both above and below the rating flume, particularly as to gravel deposits.

[fol. 1307] (2103) The Divide Ditch above the flume and just below the flume contained a heavy blanket of gravel deposit; also, a gravel deposit in the upper and lower ends of the flume. There was an irregular area in the bottom of the flume practically free from gravel. It was evident that heavy gravel deposits form annually during the time of greatest diversion, not only in the flume, but above and below the flume. A large spoil bank, as well as a large ditch bank, were evidence of the amount of gravel previously deposited and removed.

Robert Gwynn, assistant caretaker of the Divide Ditch, informed us that it was necessary to remove the gravel de-

posits from the Divide Ditch and rating flume annually. He stated that the gravel deposit on the flume itself had been removed during the past two or three days previous to our visit. Its condition indicated that deposits were being built up, creating a constantly changing condition in the cross-section and the flume.

As to what effect the deposits of gravel in this Divide Ditch and in the rating flume would have on the measuring device, with reference to whether they could accurately record the water discharged under those conditions, the accuracy of a rating flume depends upon the maintenance of the conditions of the flume and adjacent canal as they prevailed at the time the flume was rated for discharge. If the channel of the canal above and below the rating flume, or the section of the rating flume itself, is constantly changing because of gravel deposits or other obstructions which change the cross-sectional area, the gradient of the ditch, or deposits, causes the staff gauge or automatic recording device to read a depth of water not the true depth at that time, the (2104) calibrations of the measuring device will not apply and a false record will be made showing a discharge other than the true discharge. The deposits of gravel in the Divide Ditch and rating flume because of changed cross-section and gradient, materially interfere with the discharge as indicated by the staff gauge or auto- [fol. 1308] matic recorder readings and the resulting discharge records are inaccurate and unreliable.

I am familiar with the territory along Sand Creek in Wyoming, and with the ranch lands that are irrigated from the creek. I do not know the ranches which Mr. Bruce Eaton testified he had purchased certain water rights of, amounting to 16 cubic feet, but I know approximately where they are located.

The diversion from the Sand Creek channel through the Eaton Ditch, being located above the point where water is diverted from Sand Creek to irrigate ranches in Wyoming, would injuriously affect these ranches by reason of the loss of this water. It would deplete the stream, and when the water was relatively short or low, it would so deplete the stream that there would be insufficient water available for irrigation above or below the ranches formerly owned by Bruce Eaton.

(2105) This would be caused because of the return flow of the ranches above would satisfy the Eaton owners to a certain extent, and the lands formerly owned by the Eatons would be available for ranches below. It would injuriously affect both irrigated lands below the ranches, from which Mr. Eaton attempted to segregate the water rights, as well as above.

I have at various times made a request on Mr. Eaton for the release of water to satisfy shortages on the Sand Creek territory below the diversion works. He has always agreed over the telephone to release some water, and some years we checked him and some years we did not, as to whether water was releasd or not. In 1932, we found the release was insufficient and made the second request, and got water released.

From my requests upon Mr. Eaton for the release of water, and from his responses thereto, I think Mr. Eaton recognized the right of the Sand Creek ranches to divert and use a portion of the Sand Creek water. He did not make any objection to the release. I requested the water [fol. 1309] released for use below the Sand Creek diversion works, in accordance with the adjudicated water rights on Sand Creek ranches in Wyoming. It would satisfy Sand Creek appropriators in Wyoming. (2106) I visited the vicinity of the Bob Creek Ditch and the Columbine Ditch on June 29th, 1933, in company with Mr. R. I. Meeker. The purpose of this visit was to examine the Columbine and Bob Creek ditches to ascertain their physical condition, to see if they were or had been in operation during the 1933 irrigation season, and what steps, if any, had been taken by the ditch owners and the State of Colorado to prevent trans-mountain diversions by these ditches. We proceeded to make an investigation or observation for that purpose.

As to what we observed with reference to the Columbine Ditch, at the time of our visit, which was on June 29th, 1933, it was running very little water. Meeker estimated it as 1/50th of a cubic foot; I would describe it as a mere trickle. There was no automatic recorder in operation. We followed up the ditch, finding occasionally a big snow drift, but no water running away from the same. The ditch was dry, except for a few small puddles of water.

The waste ways of the ditch were open. Boards had been nailed over the upper end of the covered section, which is

located at the lower end of Columbine Ditch. These boards were used to close this section to prevent snow blowing in during the winter months. It would (2107) appear that they had, by this means, closed this portion of the ditch temporarily against the passage of any large quantity of water, thus forcing it out the waste way a short distance above the upper end of covered section of ditch. To insure Wyoming against diversion of water by Colorado, an earthen dam should be constructed across the ditch immediately above the covered section of the canal.

From the outlet of the Columbine Ditch, we walked up the ditch bank. The ditch, for the most part, was free of snow [fol. 1310] and dry except where it intercepts the two branches of Deadman Creek. The first stream intercepted by Columbine Ditch was flowing approximately one and one-half cubic feet of water per second. This water flowed into and down the ditch for a distance of approximately three hundred feet to a waste-way where it left the ditch and returned to the stream.

The Deadman branch above the one heretofore mentioned, was contributing about one cubic foot of water per second of time to the ditch. This water was escaping back to the stream through a waste-way located a short distance below the point of diversion or inflow. The Columbine Ditch had the appearance of not having been used during the present season, the surprising thing of the whole trip being the absence of water running into the ditch from the snow banks above. A careful examination of the upper banks of the canal would indicate the absence of any appreciable runoff into the ditch, except at the points where the ditch covers natural streams.

We made a similar observation of Bob Creek. We observed (2108) that no efforts had been made to prevent the diversion of water by Bob Creek other than opening the spillways and fastening boards over the inlet of the covered ditch sections, which is the customary preparation for winter months. The south feeder canal of Bob Creek does not have a waste-way for discharging the waters collected by that ditch. All water entering south feeder canal, until of sufficient depth to overflow banks, cannot escape and flows into Bob Creek Ditch and thence through covered section into Poudre River drainage.

As to what conditions we found pertaining to water from diversions by Bob Creek during the year 1933, as a result of our visit, following the phone line, we walked from the Columbine Ditch to the Bob Creek Ditch, and thence down said ditch to its outlet. We found a few small streams discharging water into the ditch. The water thus diverted was escaping through waste-ways back to the stream. The ditch was discharging not in excess of one-fifth of a cubic foot of [fol. 1311] water per second on June 29th, 1933. The lower end of the Bob Creek Ditch is a covered section in cut—very similar to the lower end of the Columbine Ditch. The entrance to the covered section of the Bob Creek Ditch had been boarded up to prevent snow drifting in during the winter months; however, three of the boards were loose. Two of these boards, which were vertical, were fastened by one nail at the upper end and swinging loose at the bottom; the third board was loosely resting against the others. (2109) This arrangement for closing the covered section of the ditch to snow was apparently not effective as against preventing the flow of such water as might enter the main canal or south feeder ditch below all spillways. In fact, the boards were so hanging as to leave openings between the boards.

The condition of the Columbine and south feeder ditches would indicate that little or no effort had been made to prevent the flow of such water as might enter the ditch or feeder and reach the covered ditch section from running into the Cache la Poudre drainage. The water marks on the sides of the Bob Creek Ditch, both above and below the covered section, would indicate that some water had been diverted during the 1933 season.

The south feeder ditch is now in condition to divert and deliver to the entrance of the covered section of the Bob Creek Ditch, a considerable quantity of water, estimated at from eight to ten cubic feet per second. With a small amount of repair work, this ditch would be able to divert a much larger quantity.

To insure a complete cessation of diversions by the Bob Creek Ditch and south feeder ditch, an earth dam should be constructed at or below the junction of the two ditches and opening provided through the present ditch banks above the junction to prevent the release into the Laramie River

drainage of all waters finding their way into Bob Creek Ditch and south feeder ditch.

[fol. 1312] We took photographs, which I have here, to picture these conditions we observed there.

(2110) (Complainant's Exhibit No. 102 marked for identification.)

(Four photographs taken by R. I. Meeker on June 29th, 1933, of the Columbine, Bob Creek and South Feeder Ditches.)

Photograph marked 1 on the back, of Complainant's Exhibit 102, is a picture of the entrance to the covered section of the Columbine Ditch, as observed on June 29th, 1933. It shows the boards over the entrance of the covered section of this ditch to keep out the snow. Photograph No. 2, on the back, is a picture of the entrance to the covered section of the Bob Creek Ditch, the photo being taken June 29th, 1933. It shows the boards, the condition of the boards, at the upper end of the covered section, and the opening between the boards which would permit water to pass through the covered section into the Cache la Poudre drainage. The water mark on the ditch bank on the left hand side would indicate that during the present irrigation season, some water has been passing in that ditch.

It shows the water mark there, which is fresh, probably down to a depth of fifteen or eighteen inches of water in the ditch. Photograph marked 3 on the back is looking down the south feeder ditch, toward the junction with the Bob Creek Ditch. This ditch has an original embankment, and then to the left is a second embankment which has been built in comparatively recent years. The original ditch, with its old (2111) embankment, will carry about an additional foot of water in depth than what was in it on the day of our visit on June 29th, and it is estimated that its carrying capacity would be from eight to ten cubic feet per second. Photograph 4 is a picture of the Bob Creek Ditch from the log house over the measuring flume. The channel and banks show erosion of loose dirt near the toe of the slope. This would indicate there has been a considerable head of water in the ditch some time during the present season.

[fol. 1313] Those photographs were taken by Mr. Meeker, who accompanied me to the Columbine and Bob Creek Ditch on June 29th, 1933.

(Complainant's Exhibit No. 102 offered in evidence.)

I last visited the east portal of the Laramie-Poudre Tunnel on June 24th, 1933, with R. I. Meeker, consulting engineer of Denver, Colorado. We visited both portals on that day; we visited the east portal first and later on, the west portal. At the time of our visit, we observed the conditions existing in the canal at the east and west portal with reference to the flow of water and the measuring devices.

We arrived at the east portal of the Laramie-Poudre (2112) Tunnel at 8:45 a. m. on June 24th. The staff gauge in the stillwell of the Improved Venturi or Parshall flume read 2.11 feet and the chart record read 2.18 feet, a difference of 0.07 feet. According to the Colorado State Engineer's table for discharge through an Improved Venturi flume, the gauge readings would indicate approximately eighty cubic feet per second discharge at that time.

We observed evidence of debris in the outlet structure and in the flume. There was an island of debris in what has been described as the stilling pool of the outlet structure. The debris was located to the left and below the tunnel outlet. There was also a deposit of debris in the concrete approach channel to the Venturi flume and in the converging section of the said flume. This debris was deposited on the right side of the concrete approach channel beginning a short distance below the inlet to the said channel and extending into the converging wooden section of the flume to within two (2) feet of the flume staff gauge. The deposit from the upper end gradually widened or extended to the left into the channel until at the upper end of the wooden converging section of the flume, it ex- [fol. 1314] tended about half way across the channel. From this point, it gradually narrowed toward the right side of the converging section of the flume and ended, as heretofore stated, about two feet above the staff gauge on the right side of the flume.

(2113) Photographs numbered 2, 3, 4, 5 and 6 of Complainant's Exhibit No. 100, show the deposit of the debris to which I just testified. As to what effect was noticeable as to the deflection of the current in the channel of the

flume because of the presence of this debris, the water flowing from the tunnel was confined by this debris to a channel along the south or right wall of the outlet structure. Upon reaching the east wall, it was deflected and flowed along the east wall of the outlet structure until it encountered the debris in the approach channel and flume which deflected the current to the left side of the wooden converging section and throat of the flume. The change or deflection of this current from the right side of the approach channel to the left side of the flume, created a high velocity of water along the left side of the flume and a relatively still body of water in the right half of the flume, below the deposit of the debris.

The presence of these deposits of debris, causing the deflection of the current, would greatly affect the accuracy of the measurement of water passing through the flume. The Improved Venturi or Parshall flume is a device which, when properly installed in a suitable location, will measure the discharge of water without special rating, because it has been calibrated and rated in the experimental laboratory. Its accuracy must, therefore, depend upon its installation under conditions that are similar to those under which it was calibrated, which are uniform velocity of approach to and through the converging section of the flume with the resulting uniform velocity for any gauge height for similar depth of water on the crest of the flume.

The conditions surrounding the installation of the Im- [fol. 1315] (2114) proved Venturi or Parshall flume at the east portal of the Laramie-Poudre Tunnel, are such as to preclude its measuring the discharge of water from the tunnel within practical limits, because of the unbalanced velocity conditions caused by debris deposits and the steep gradient through the approach channel. I agree with the opinion stated by Mr. Parshall, that the burden imposed on the flume at this point is too great for accurate results.

Mr. Meeker and I made some current meter measurements for velocity. In order to check the Venturi flume for unbalanced velocities, measurements of the velocities were made with a current meter on June 24th, 1933, by Meeker and Whiting. Meeker operated the meter, and I recorded the notes. The following velocities of the water

at several points from the tunnel outlet to the crest of the Improved Venturi flume were obtained.

Mr. Meeker has heretofore testified to these velocities, which varied from 8.68 at the mouth of the tunnel, to 3.77 about half way between the mouth of the tunnel and the Venturi flume. At about a foot and a half above the crest of the Venturi flume, we found a velocity on the left side of 7.23. These figures would indicate a gradual decrease in the velocity of the water from the tunnel outlet to a point above the entrance to the approach channel, and thereafter, a constantly increasing velocity until it passed the crest or throat of the flume. The crossing of the current from the right of the approach channel to the left of the flume with its high velocity causes a greater depth of (2115) water on the left side than on the right side, in which the stilling well is constructed.

The difference of 2.31 feet per second velocity on opposite sides at the throat of the flume is conclusive in itself that accurate discharge of the water from the tunnel cannot be obtained by the Improved Venturi or Parshall flume as now installed. These measurements establish the fact that unbalanced velocities exist at the crest or throat of [fol. 1316] the flume.

Referring to Exhibit 100 again, as to whether any of these photographs indicate a variation in the depth of the water in the flume or in the approach, Photograph 6 shows the Venturi flume itself, and a portion of the approach channel above the flume. Here the current has crossed from the right hand side of the approach channel to the left hand side of the Venturi flume and, as you observe up on the crest, it is higher on the left hand side than on the right hand side. It is also very much swifter on the left side than on the right hand side, as determined by the current meter measurements as made by Mr. Meeker and myself.

The Parshall-Hinderlider-Field current meter notes, which was a measurement of the flow of water at the east portal of the Laramie-Poudre Tunnel on July 5th, 1932, shows the following information—the (2116) gauge heighth given in the notes at the beginning is 1.13 feet, and at the ending, 1.17 feet; a mean gauge height of 1.15 feet. The average depth of the cross-section is 1.33 feet, and the discharge computed from the current meter measurements

made by Mr. Hinderlider and Mr. Parshall and Mr. Field is given as 36.52 cubic feet per second. The discharge taken from the Venturi table, using the mean gauge heighth, would be 30 cubic feet per second, and using the average depth as the gauge heighth, is 37. cubic feet per second.

The current meter notes of the Hinderlider-Field-Parshall measurement of July 5th, 1932, show that the measurement was made four feet upstream foom the crest of the Improved Venturi flume, where the width of the flume was 7.7 feet. The velocity of the water per second obtained across the section measured varied from 0.52 feet on one side of the flume to 4.24 feet on the opposite side of the flume. This difference of 3.72 feet in velocity of the water on the opposite sides of the flume within four feet of the crest, are the results of debris in the approach channel and [fol. 1317] converging section of the flume and creates the "unbalanced velocities" to which Mr. Parshall has referred in his statement to W. W. McLaughlin, Chief of the Division of Irrigation, United States Department of Agriculture, under date of April 14th, 1933, in which he said, "In my opinion, it is asking too much of this type of measuring device to measure within practical limits under conditions imposed here, because of the debris and unbalanced velocities."

Mr. Parshall has testified at Page 1365 and 1366 of the testimony in this case, that the Venturi flume at the east portal of the Laramie-Poudre Tunnel was constructed from plans prepared by himself. (2117) Both the plans of the State Engineer's office of Colorado, as given in Paragraph 4, Page 9, Complainant's Exhibit No. 56, and Mr. Parshall, in his testimony and in Paper No. 1586, page 843, Transactions American Society of Civil Engineers, provide for the floor to be level, both length and crosswise. The crest is the down-stream end of the level floor. The gauge rods or automatic recording devices for obtaining the upper head are referred to the crest level as the datum. Thus, the plans provide for correct installation—that the floor of the converging section and the crest be at the same elevation. It is assumed that the floor and crest of the Improved Venturi or Parshall flume at the east portal of the Laramie-Poudre Tunnel was properly constructed according to the plans of Colorado and the inventor of the flume, Mr. Parshall.

The Hinderlider-Parshall-Field current meter notes taken during the measurement of the discharge of the Laramie-Poudre Tunnel at the east portal, July 5th, 1932, show a considerabe difference between the depth of the water in the flume as shown by the depth measurements, and the depth of the water as shown by the staff gauge height. As both measurements give the d*pe*th of water above the crest of the flume and the water surface, at, approximately the same point, the readings of the staff gauge and the depth of water should agree very closely.

[fol. 1318] Further examination of the notes show that at the beginning of the measurement, the gauge height was 1.13, and the first depth measurement, 1.37, or a difference of 0.24 feet, or 2.88 inches. At the ending of the measurement, the gauge height was 1.17 and the depth measurement, 1.34, or a difference of 0.17 feet, or 2.04 inches. The (2118) mean gauge height for the measurement was 1.15, and the mean depth measurement 1.33, or a difference of 0.18 feet, or 2.16 inches. This would indicate that the zero of the gauge, which is presumed to be level with the floor and crest, was really from 2.04 to 2.88 inches above the floor.

This prevailing condition would indicate that the staff gauge or recording device was indicating or registering a depth of water in the flume from two to three inches less than the actual depth. The use of this mean gauge height of 1.15, under these conditions, to determine the discharge from the table of discharge published by the State Engineer of Colorado, would give the amount of water discharged as 30 cubic feet per second, or 82 per cent of the amount delivered by current meter measurement; whereas, if the gauge height was corrected to show the actual average depth of water as 1.33, on the assumption that zero of the gauge is even with the floor of the flume, the discharge from the tables would be 37.82 cubic feet per second, or within 3.5 per cent of the discharge obtained by the measurement. The automatic recorder at the flume, under these conditions, would report as discharged, only 82 cubic feet out of every 100 cubic feet passing the flume.

Mr. Whitten, hydrographer for the State Engineer's office of Colorado, made a current meter measurement of the discharge of water through the Improved Venturi or Parshall flume at the east portal of the Laramie-Poudre Tunnel

on September 5th, 1932, two months after the Hinderlider-Parshall-Field measurement was made. These current meter measurements show that on September 5th, 1932, the gauge heighth read 0.90 feet at the beginning, 0.90 at the end, and gave a mean heighth of (2119) 0.90 feet. The [fol. 1319] average depth of the cross-section was given as 0.92 feet. The discharge computed from current meter measurements was 0.92, and the discharge taken from the Venturi table, using the mean gauge heighth, 0.39. The width of the section at the point of Whitten's measurement is given in the notes as 7.3 feet. The Hinderlider-Parshall-Field width of the section, as 7.7 feet, showing that the two measurements were made at practically the same location in the converging section of the flume.

The current meter notes of Mr. Whitten show the floor of the flume and the zero of the gauge to be practically of equal elevation—the variance being only 0.02 feet, or less than one-quarter of an inch, as compared with two or three inches in the July 5th measurement by Parshall, Hinderlider and Field. Mr. Whitten again measured on September 5th, 1932, the discharge through the flume at apparently the same section, and found the zero of the gauge and the floor to differ by 0.06 feet, or about three-quarters of an inch. Both of Mr. Whitten's measurements check closely with the discharge measurements given for his gauge heights in the standard table of discharge for the Improved Venturi flume.

Examination of these current meter notes indicate that competent and qualified hydrographers, including the inventor of the flume, himself, viz., Mr. Parshall, are unable, under the conditions existing at the Improved Venturi or Parshall flume, to make comparable measurements. In my opinion, this Improved Parshall-Venturi flume is a practical and satisfactory device for measuring water when installed where conditions are similar to those prevailing at the laboratories where flume was designed (2120) and tested and calibrated.

Mr. Ralph L. Parshall, the inventor of the Improved Venturi or Parshall flume, states, in Bulletin 336, page 32, Colorado Experiment Station, Colorado Agricultural College, Fort Collins, Colorado, entitled, "The Improved Venturi Flume", by Ralph L. Parshall, Irrigation Engineer, "This [fol. 1320] device, like any other water-measuring struc-

ture, must be properly installed and maintained to give best results." On page 43 of Bulletin 336, Mr. Parshall says: "For the smaller sizes, the fact that the longitudinal axis of the structure is not exactly coincident with that of the channel is of little importance where only moderate flows have to be cared for, but the large flumes should be so set that this axis is approximately correct to permit the stream to approach and leave the structure without undue distortion. Hence, the side of the flume should not be in a decided bend of the channel."

I agree with that statement as to what constitutes proper installation of an Improved Venturi flume, and with Mr. Parshall's opinion that the present installation, as expressed in the memorandum dated April 14th, 1933, which has been identified as an exhibit in this case, as to whether it would properly and correctly measure water under the conditions of the installation. The conditions existing at the east portal of the Laramie-Poudre Tunnel are unsuitable for the installation and operation of an Improved Venturi or Parshall flume if the measuring device is required to measure the discharge of water within practical limits—which is the requirement for all recognized diversions.

I have examined the canal diverting water from the (2121) Laramie to the Poudre, of which the tunnel is a portion, from the west portal to the tunnel and the intake point. From my knowledge of the territory through which the canal passes, there is, in my judgment, a suitable place to measure water or to install the measuring device in the canal of this diversion works. The canal between the point of diversion on the Laramie River and the west portal of the tunnel offers an ideal place for the installation and operation of an Improved Venturi or Parshall flume, or any other suitable standard measuring device. I base that statement upon the fact that the velocity of approach would be uniform and not excessive. Low and uniform velocities [fol. 1321] would eliminate the transportation of materials which would lodge in the flume and avoid the deposits of debris and the unbalanced conditions on the Improved Venturi or Parshall flume at the east portal of the Laramie-Poudre Tunnel as to make its measurement unreliable.

I have observed the channel as it flows between the intake point from the Laramie River and where it empties into the

west portal, and have found the condition of the channel to be, in my judgment, satisfactory for proper measurement—it would require a little work in order to make it satisfactory. It possesses a long straight channel, very uniform and regular, and uniform velocities until it (2122) reaches a point about two or three hundred feet above the west portal of the tunnel, where debris has evidently fallen in from the banks and created a bar and restricted the sides until it formed a barrier in the channel. The removal of this barrier, which, in my judgment, would be relatively inexpensive, costing probably not more than two or three hundred dollars, would permit the water to flow at a lower depth in the canal above and make it suitable for the installation of either a rectangular flume or Improved Parshall-Venturi flume. That installation could be made in a straight portion of the channel, where the water could approach it directly and leave it without making a bend either way. I agree with the testimony of the witness for the defendant that that is a favorable condition for accurate results from the installation of a Venturi flume.

Cross-examination.

By Mr. C. D. Todd:

I have been familiar with the Sand Creek Ditch in Wyoming for several years. I would say I have been going to Sand Creek for the last fifteen or eighteen years, and of course, have been much more familiar with it during my term as State Engineer, which was from January 3rd, 1927, until April 1st, 1933. I have been connected with the State Engineer's (2123) office at times for the past thirty years, off and on.

[fol. 1322] I had a communication with Mr. Eaton about turning down some water for the appropriators in Wyoming. In those conversations, he stated that he would turn down water; my conversations were always with Mr. Rex Eaton on the matter of turning down water. I would not say that that was late in the season when there was scarcely any water on either side of the line; there was considerable water in Sand Creek above the headgate of the Divide Ditch, but the water below inWyoming was very low—so low that some of the appropriators were unable to abtain water.

I presume that water was made up of the Deadman water plus any that was in Sand Creek; I had no knowledge at that

time whethere there was any Deadman water flowing in Sand Creek or not. As to the elevation of Deadman Creek being such that water would run later there than in Sand Creek, I would not care to make that statement. I think the elevation of the upper reaches of both Deadman and Sand Creek are about the same, and whatever snowfall they had on one, presumably they would have on the other.

The water that is in Sand Creek in Wyoming is used (2124) mostly on meadow land, and the water so diverted on the meadow lands readily runs back into the creek again, if the diversion is sufficient to permit return flow. The meadows lie very close to the creek. They are along the stream, and none of them, I would think, would extend more than perhaps three-quarters of a mile or a mile from the stream. I do not believe that the soil is under-laid with gravel. I think it would be favorable for a heavy return on the surface at a slope.

I think I remember the testimony of Mr. Fleming, who testified as the first witness in this case. I cannot recall what his statements were concerning the return flow to the stream. Looking at Page 113 of Exhibit No. 1, prepared by Mr. Fleming, who spent a whole summer in 1902 in measuring the waters of Sand Creek, as to the return waters after [fol. 1323] the first flow over the land, he says, "Per cent of amount applied returning", and he gives 7.6, which I assume is a percentage; (2125) but in the statement above, ht says, that the return flow is 95.1 per cent after the water has been on the land.

As to whether, if there was ten feet or twenty feet of water in Sand Creek, it could be utilized by several ditches before it would be exhausted by the consumptive use, my experience of thirty years would lead me to believe that in order to get 95 per cent return flow, an enormous diversion would have to be made, and with the ordinary diversion of these ditches in Sand Creek, I doubt very much whether they have that return flow. We all know that water for consumptive use has to have a carrier, but a carrier sufficient to return 95 per cent of the water would be a big one, and I believe that his table is misleading.

As to his statement that he spent the entire summer in measuring the waters, and prepared that table on that, I would say this, that my experience over thirty years would indicate that unless there was an enormous diversion of

water on to the land, that you could not hope to obtain a return flow of 95 per cent. I do not believe you would ever get 95 per cent return. As to whether you could ever get 75 per cent, of course, the amount of return flow depends on the amount of diversion—I think, under normal conditions, you could get probably sixty or seventy per cent.

(2126) There is nothing to keep the creek from running right in to those ditches down in there and creating a heavy diversion, if there is water available in the stream for diversion. It diverts itself—in many cases, they are what we call self-operating ditches. As to whether the water officials have any control over the ditches, most of them are small and could be shut off by building a small dirt dam with a shovel. If they dammed it up, they would not get any water, unless they leave a small opening in the dam. If the water commissioner is called upon, he usually takes a shovel [fol. 1324] along to put in dams, especially where there is no structure.

It is not possible to so regulate the water in that creek with the existing appliances so it will go to the oldest appropriators and exclude the juniors. It would be necessary for the water commissioner to build some sack dams or shovel in an earth dam, which we frequently have to do on the Laramie River, in order to regulate some of the ditches where the headgates are missing or have been washed out. The statutes of Wyoming provide that the superintendent of the water division may order the owner of the ditch to construct a suitable headgate or measuring device.

As to whether or not there is a dam in the creek some miles north of the Colorado state line by which water is diverted over (2127) into Antelope Creek, I could not testify to that, Mr. Todd, I never noticed that particular ditch.

My recollections are, without refreshing my mind from my diaries, I had a complaint about there not being sufficient water for these meadow lands every year, and in some years I had two or three. I called up Mr. Eaton on most of those occasions. I think sometimes I called the water commissioner and asked him to look after the situation. As a result of that, I believe the water was let down on some occasions; on other, I left that matter to the water commissioner and whether it was let down or not, I do not know. I never heard anything from it.

Such occasions and demands occur on every stream, where the water commissioner is called upon to shut off some ditches and turn on others temporarily. Almost every stream requires administration. That is the general purpose of having a water commissioner on the ditch or river. It is not possible for him to go along always to see that everybody is getting water; he relies more or less on complaints, and (2128) rectifies them if it is possible.

I stated there was some gravel in the upper and lower [fol. 1325] parts of the Divide flume. I would judge the ditch had quite a heavy fall, and what I found there was brought there by the action of the water. Some of it lodged above, and some below, and some ran through. The point where the measuring was taking place was practically clear, but the fact that there was a deposit built up in the channel above and below would affect the operation of the measuring devices. The measuring devices would not take into account the hole that has been formed at the measuring flume. If the flow is clear at the point where the device is operating, it gives a true measurement of the depth of the (2129) water on the floor of the flume, but not to the index of the discharge at that point under those conditions.

To operate the rectangular flume, it is necessary and recognized, I think, by all water officials that conditions must be maintained the same both above and below within the flume, or otherwise you get a new condition and you have rated your flume for a certain definite condition. It is your intention to keep the conditions the same, and when those conditions change, you have a changed condition and the recording devices, or staff gauge, while reading the depth of the water in the flume, if the bottom is clear of gravel, does not give a correct index of the water in there.

That flume is located in line with the ditch, and I would say it is well located, as far as the line is concerned, and substantially built. The wash I spoke of is disintegrated granite from above. I have not made a study as to whether there is any way to prevent that. There might be some way of de-silting the water of the disintegrated granite; I thought of that when I was at the ditch, but did not have the time to look the ditch over. I do not know as that would be a very unusual thing to attempt. Perhaps, if it would save maintenance of the ditch and that constant cleaning

during the (2130) period of operation, it might be a profitable investment.

[fol. 1326] The company employes have cleared this debris out from time to time right on the flume, in order to get a measurement, but the clearing of the ditch itself is a matter, I think, of where the water has been out of the ditch when the cleaning took place. I am referring to this deposit in the ditch. I would not say that the deposit in the ditch would necessarily have to come down; I would think perhaps there might be some way of removing it. As to whether in an ordinary state, more or less debris will come along from time to time and have to be cleaned out, I think this deposit indicates there is a cutting somewhere in the ditch —somewhere there is a very extensive grade—and perhaps the lining of that section, or some means of de-silting the gravel from the ditch below the section, would save the expense and keep this deposit out of the ditch and the flume and permit an accurate measurement of the water flowing in the ditch.

If the floor of the flume is cleaned periodically, from day to day, or frequently, as the material assembles, it would not affect the flow of the water through the flume, but it would affect the heighth of the staff gauge or depth of water on the recording instruments, so (2131) when you apply that depth to your rating curve, you would get a false discharge—that is, not the true discharge. I would not say whether it would be sand or water that you would be measuring; I would say this: that the deposit of sand and gravel in that ditch above and below would so change conditions that the measuring devices would not give a true index of the amount discharged, and when applied to the rating table, which had been obtained by calibration of the flume, itself, under favorable conditions, it would not indicate a true discharge.

If there was a deposit of .3 of sand in the flume, it might raise the water level about .3, and then again, it might not. When I answer that way, I am thinking that perhaps as that gravel comes down around the ditch, that there is a flatter [fol. 1327] section of the ditch in there, and this gravel builds back until it increases the gradient, and perhaps, as that gravel builds up, it increases the velocity at that point and, as a result, you may get more water through a certain section there after the deposit was in than you did before.

I make this statement, that you cannot measure the water accurately under these conditions, with a rating curve that has been fixed or used from year to year, month to month, or week to week. You have what we term a shifting channel, and the only way you can determine the flow in a shifting channel is by constant measurements, and we have had to make measurements sometimes daily, sometimes twice a day, and you have a condition in the Divide Ditch, a shifting channel, very similar to the channel on a river. It would be building up and down the flume for some distance —a bar has (2132) been formed on the right hand side of the ditch. Before that was formed, water apparently followed the right bank, but afterwards, it followed it to the left bank, and that created more or less of a cross current. Just as soon as the flume is cleaned off, the gravel begins to deposit again.

We noticed the gravel washing in there along on the bottom, and of course, the bottom of the flume itself, being lower than the grade of the ditch above and below it, it naturally falls into this hole and naturally creates an eddy. It naturally builds itself up, once left to itself, until it builds itself up to the heighth of the gravel in the ditch above, both above and below the flume.

Redirect examination.

By Mr. James A. Greenwood:

The demands coming to me for water upon Sand Creek were based upon adjudicated priorities. All of the rights on Sand Creek have always been carried in our records as existing rights and appropriations, for which they were entitled to water, and which the water officials of Wyoming delivered. They are not only carried that way, but they are that way.

It would be possible to determine the amount of water [fol. 1328] that was diverted by the Divide Ditch, which was contributed by Deadman, (2133) and that which was contributed by Sand Creek. That would be done by measuring the water that flowed out of Deadman Ditch into Sand Creek drainage, and then, with a proper allowance for loss and the measurement of water passing the headgate of the Divide Ditch in Sand Creek, and of the water diverted by the Divide Ditch, and with those factors at hand, this amount

could be determined. In other words, it is a condition that could be so managed as to determine, making allowance for transportation, the exact amount of water that was diverted from Deadman Ditch to the Sand Creek water.

Recross-examination.

By Mr. William R. Kelly:

I did not personally make the survey by which I ascertained the acreage of the irrigated meadows in the Laramie Valley in Colorado. That was made by Mr. Drummond, Mr. Watson and Mr. Lloyd. I did not personally investigate, in the year 1931, whether the (2134) Springer Ditch or the Brinker Ditch were running. I did not myself observe whether the Brown Ditch or the Ben Warren Ditch were diverting in the year 1931; I observed the Link Ditch No. 1 diverting in 1931, for the reason it is located at Atmore Lodge, and I stopped at the Lodge there in 1931 and observed the ditch running water then. I did not stop there very long; I do not remember the date.

As to whether I observed the Lone Tree Ditch diverting in 1931, in my trips in that year, I took the other road to the west and never went up the east road that crosses the Lone Tree Ditch.

Referring to Complainant's Exhibit 100, being Mr. Meeker's photographs at the east portal of the Laramie-Poudre Tunnel, on which I pointed out deposits or debris, designated by Mr. Meeker as "rock bar," I would not say it was a permanent condition. I think it is a condition that changes with the rise and fall of the water in the outlet structure of the Laramie-Poudre Tunnel. However, on [fol. 1329] every (2135) occasion that I have visited the east portal of the Laramie-Poudre Tunnel, and every photograph that I have seen of that tunnel, or of the outlet structure, has always indicated more or less debris there in one place or another.

I would not say it was there the day before, because some one could have removed that debris the day before, or the day before that, and then it could have filled again. I noticed while I was there for the three hours on the morning of our visit, which I think was June 24th, 1933, that there were occasional rocks rolling through the Venturi flume, and even with the amount of water there at that time,

some seventy or eighty cubic feet per second, rocks were constantly shifting and moving.

Some of these rocks on the right hand side were large, eight or ten inches through, and there was insufficient water to move them; but there was smaller rocks there that were moving. Any velocity above five feet per second is what we call a scouring velocity; it is a velocity that, if directed against a rock or almost anything of that kind, will move it. We have that experience in storm sewers and other places—it will scour it. In the flume on one side, we found a velocity a little more than seven feet per second.

I would think it is a condition that changes. I think there is always debris there, but I do not think the condition that existed that day would always exist. I think at times that bar might shift to some other part of the channel, depending upon the amount of water in the channel. As the amount of water increases through the channel, the tendency to move debris out of the channel into the outlet structure is greatly increased.

(2136) In setting the zero point of the staff gauge in the Venturi flume for measuring, in what is known as the Parshall flume, the zero is set at the crest of the flume, and Mr. Parshall, in all his statements, and the specifications put out by the State of Colorado, provide that the floor of [fol. 1330] the flume be level in all directions and even with the crest; and in so testifying, I assume that this work was constructed under Mr. Parshall, or from plans prepared by Mr. Parshall, and that it must have complied with the requirements he has drawn.

As to his making a correction to make the zero point proper at that Parshall-Venturi flume at the tunnel, my interpretation of the correction that Mr. Parshall made is that apparently it did not apply to the floor of the flume. Apparently he found the staff gauge off in some way; as far as its connection with the floor is concerned, I established no connection.

(2137) AGNES ZIMMERMAN, a witness recalled in behalf of complainant:

Direct examination.

By Mr. James A. Greenwood:

I have been sworn and testified previously in this case. On June 27th, 1932, I visited the location of Bob Creek

Ditch and found it diverting about three second feet from Bob Creek and tributaries into the Cache la Poudre River. That included what is known as Pickett Ditch, the south branch, and the main Bob Creek Ditch.

As to the testimony in this case by Mr. Hinderlider that the diversion of water by this ditch in 1932 was discontinued on June 18th, 1932, from the observations I made, the water had been cut back, the main stream, but the ditches had been broken to let all of (2138) the water back to the Laramie River watershed. It would be necessary to break those ditches in order to do it.

I visited this ditch on June 26th, 1933, and would say it had been diverting water from the Laramie River watershed to the Cache la Poudre River continuously from the beginning of the season. I base that statement on the fact that the ditches were in the same condition, with the exception of slight overflow washes, as they were in the year before—they had been opened to the back. Approximately [fol. 1331] a foot and a half was running when I was there, between twelve and one o'clock at noon; that would have been higher at night, I imagine, considerably higher.

I visited the east portal of the Laramie-Poudre Tunnel on April 9th, 1933, with Mr. Ben F. Powell, my former engineer. The purpose of that visit was just to look it over. We found that day, (2139) 6.72 feet of water going through the canal from the Laramie River to the Poudre River, unrecorded.

Mr. Kelly: We object to that as not proper rebuttal, part of the main case in chief, and it was gone into on the case in chief.

I mean by "unrecorded," the automatic gauge charts were not in operation; that would indicate it was unrecorded. No measurement was being taken as to the amount of diversion. We reduced our observations of that visit to writing. I have a written memorandum or statement to that effect with me.

(Complainant's Exhibit No. 103 marked for identification.)

(Duplicate, original of notes made by Ben F. Powell and Agnes Zimmerman as to the amount of water flowing through the Laramie-Poudre Tunnel on April 9th, 1933.)

Complainant's Exhibit No. 103 is a copy of the notes of what we found that day, written by Mr. Powell, and signed by Mr. Powell (2140) and myself. We made two copies; that bears the signatures of Mr. Powell and myself, and refers to the amount of water we found flowing through the Laramie-Poudre Tunnel on April 9th, 1933, at ten o'clock a. m.

(Complainant's Exhibit No. 103 offered in evidence.)

Mr. Kelly: We object to this as hearsay, self-serving, incompetent, irrelevant and immaterial.

[fol. 1332] Cross-examination.

By Mr. William R. Kelly:

I found .45 of a foot running. I read the gauge and staff; the automatic was not running. I think the ice was about approximately three inches above the water, which would indicate there had been a heavier run earlier than that. Mr. Powell estimated probably (2141) twice as much had run previous to that. It was a cold week that week and we thought the previous run had froze it over. We did not go — the west portal.

I am not under employment by the State of Wyoming in this case, and am not paid by any one to attend these hearings. I do not know whether I have attended them for about thirty days; I kept no track of them. I heard most of the evidence and attended them considerably, here in Cheyenne, and in Colorado. I do not know how many days we were here before; fully ten or fifteen days in Denver. I attended the entire affair. I attended considerably in Fort Collins. My sympathies are very much with Wyoming; there has been too much attempted to be put over on Wyoming. I heard most of the testimony. As to my interest being such that it causes me to come here from my home place in Colorado to Cheyenne, I am certainly not there now.

I was trying to sell a reservoir to the irrigation companies in Colorado which are directly interested in this suit. (2142) Stephen Corlett Downey of Laramie, Wyoming, was my attorney in 1926. I instructed him to write a letter to the various ditch companies interested.

(Defendant's Exhibit X-3 marked for identification.)

(Letter written over the signature of Stephen Corlett Downey, as attorney for Agnes Zimmerman.)

Defendant's Exhibit X-3 is the letter Mr. Downey wrote, purporting to act as my attorney.

(Defendant's Exhibit X-3 offered in evidence.)

I caused that to be sent to Mr. Downey. That condition, however, has been remedied, that they constructed deflec- [fol. 1333] tors in the river causing that condition.

I knew that the Laramie-Poudre Company was applying for a loan from the Reconstruction Finance Corporation, and I made some effort (2143) to prevent that. I understand I have been successful.

(Defendant's Exhibit Y-3 marked for identification.)

(Letter written by Agnes Zimmerman to the president of the Laramie-Poudre Irrigation Company.)

Defendant's Exhibit Y-3 is in my handwriting, and that is my signature. I wrote that to the president of the Laramie-Poudre Irrigation Company; I wanted to show him I had something to do with preventing the company getting the Reconstruction Finance Corporation assistance.

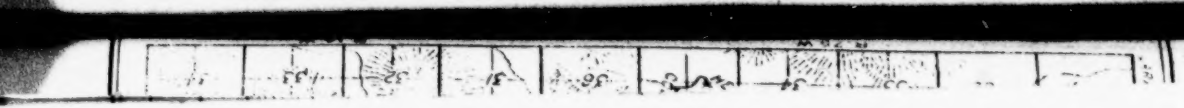
(Defendant's Exhibit Y-3 offered in evidence.)

I did not go — the west portal of the tunnel on April 9th, 1933. As to my knowing whether or not water was coming out of the Laramie River into the tunnel, it could not help but come out of the Laramie River; it could not come from any place else. I never heard of accretion in the tunnel at that time of the year.

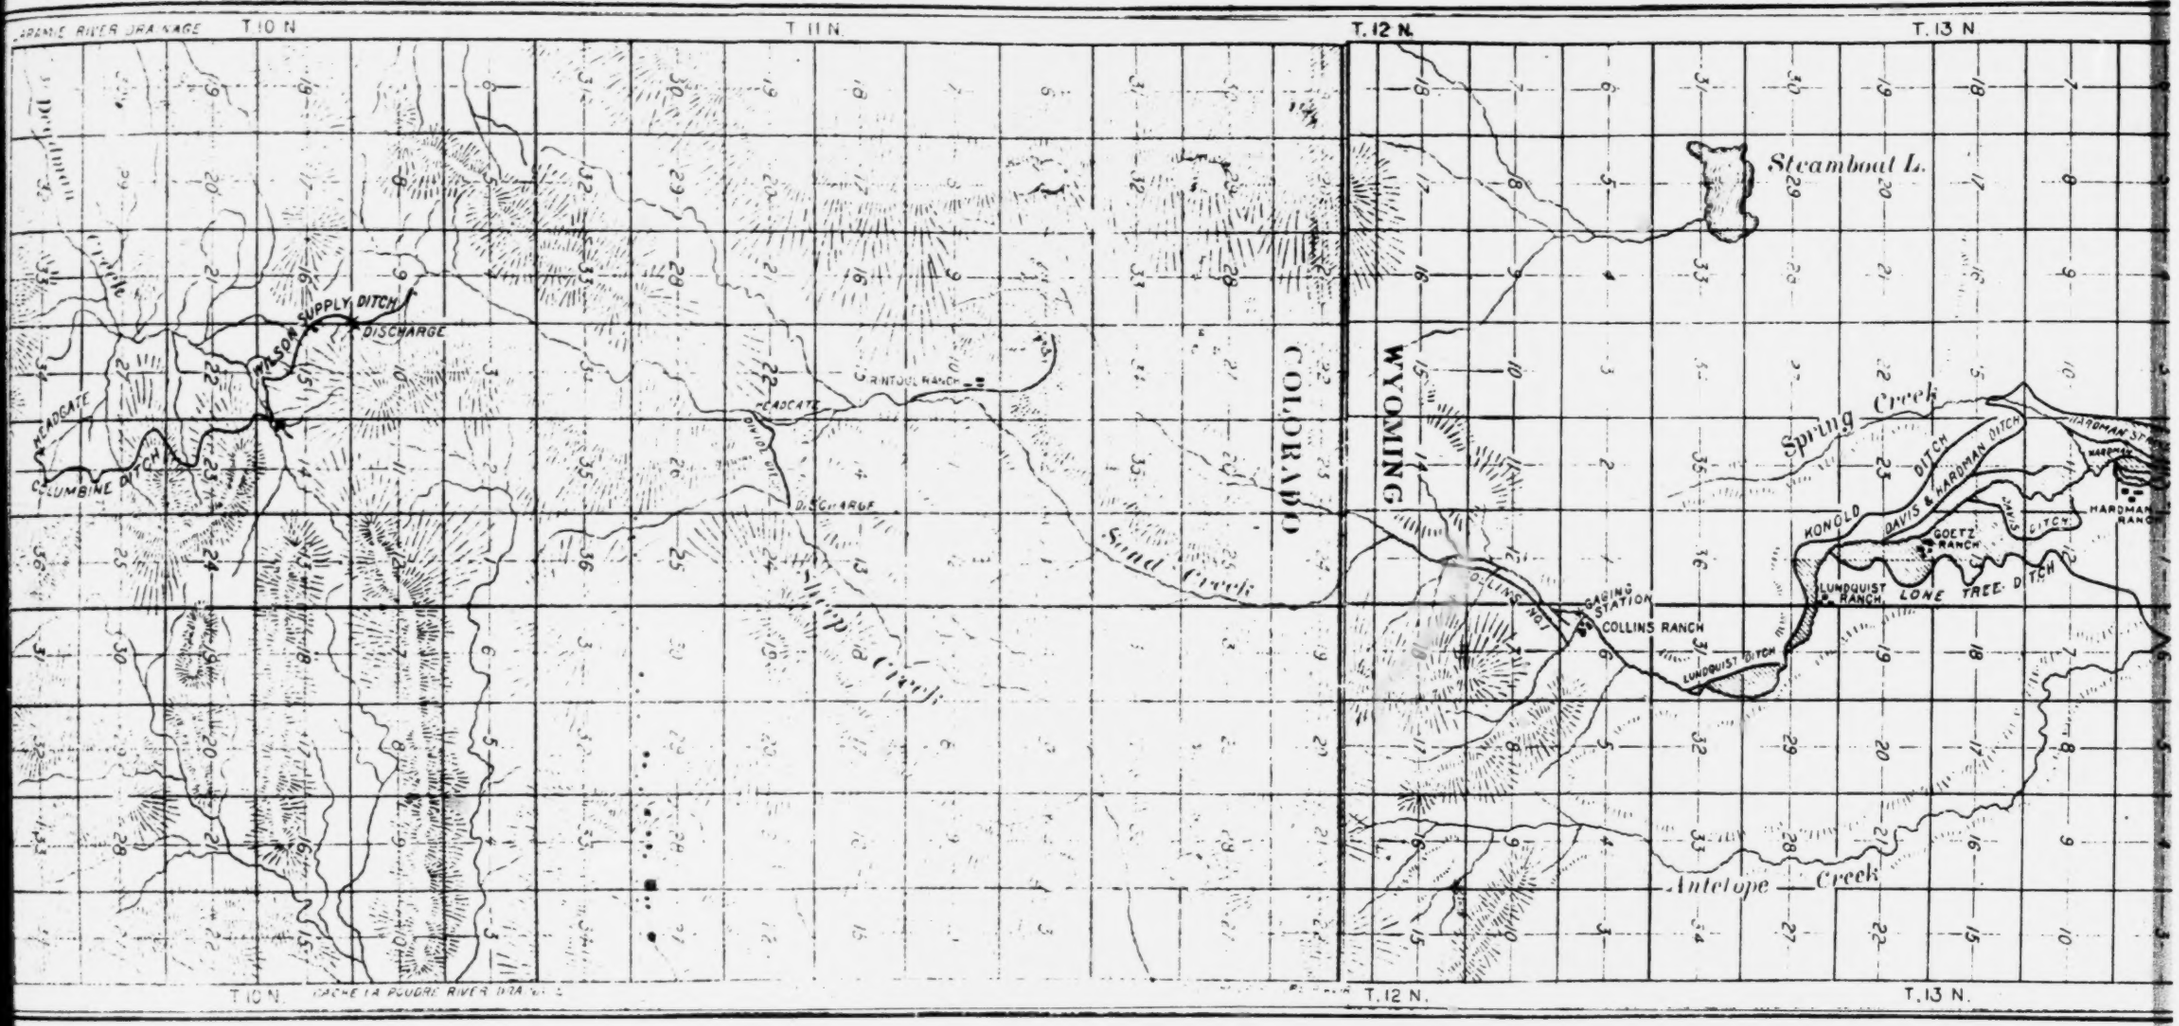
(2144) Mr. Kelly: I would like to ask leave to substitute photostatic copies of this Exhibit X-3 and Y-3, and would like to keep the original.

Mr. Greenwood: That is all right.

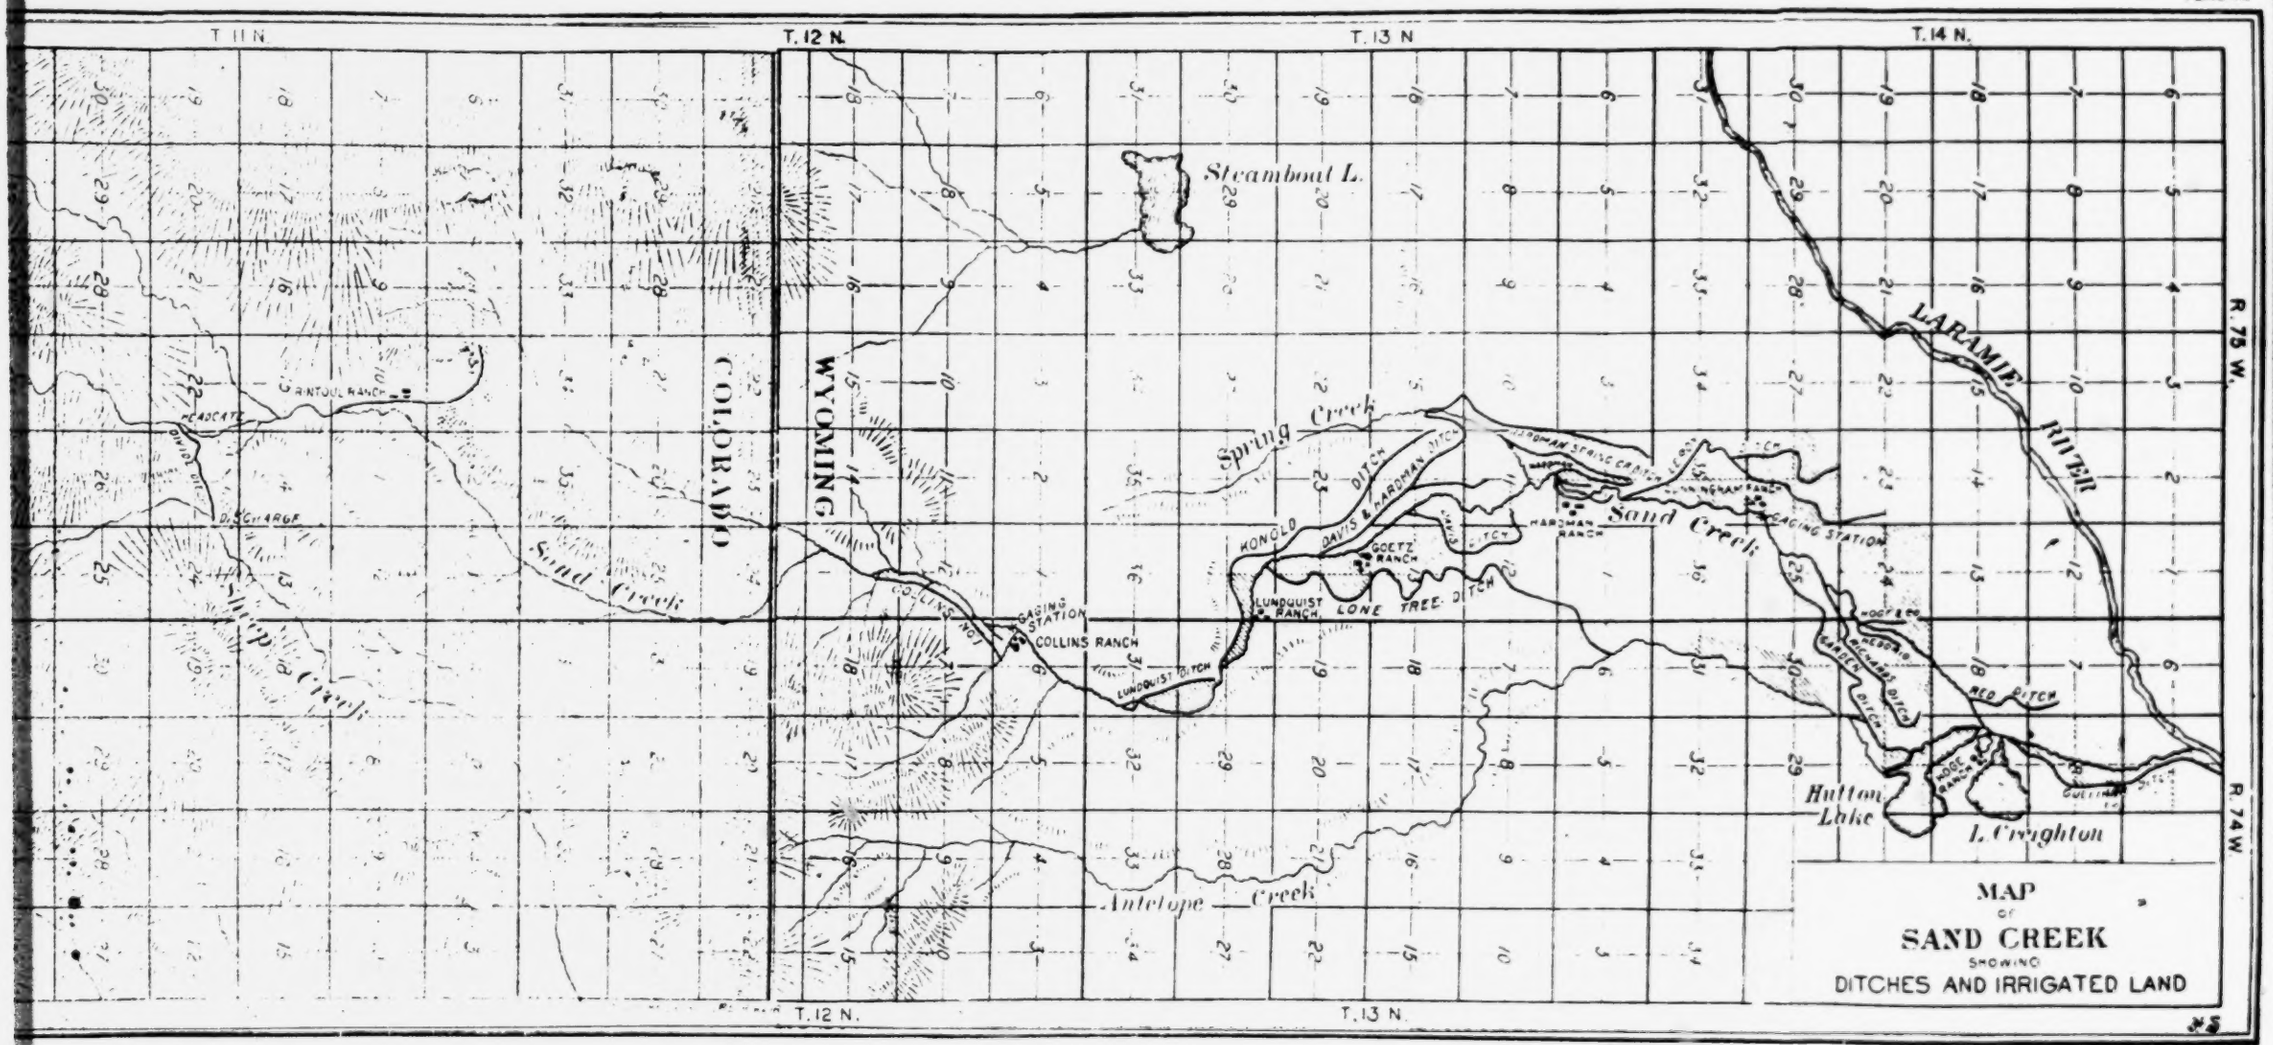
(Thereupon the complainant rested its case.)



COMPLAINANT'S EXHIBIT 1



COMPLAINANT'S EXHIBIT 1



IRRIGATION INVESTIGATIONS ON SAND CREEK, ALBANY COUNTY, WYO.

By Burton P. Fleming,
Irrigation Engineer, University of Wyoming.

INTRODUCTION.

The object of the investigation carried on in the watershed area of Sand Creek during the season of 1902 was to determine, if possible, just how the water supply is utilized in a district where agricultural conditions are typical of those at present existing in southern Wyoming, and to investigate and report upon those economic conditions which in any way affect the utilization of the water supply in such a district. Although the season proved to be somewhat unusual and although other conditions tended to make the result show an extreme rather than the normal, still it is thought that in its location, history, climate, agricultural resources and possibilities, and in the problems which its residents have to face the district chosen was quite typical.

The watershed of the stream lies partly in Wyoming and partly in Colorado. The larger and cultivated portion lies near the southern boundary of Wyoming, in the southern part of Albany County, and forms a part of the elevated table-land known as Laramie Plains. The remaining portion of the district, which is largely mountainous, lies in the north central part of Larimer County, Colo. The course of the stream is shown by the map (Pl. VI). It joins the Laramie River about 15 miles southwest of the city of Laramie.

Irrigation on Sand Creek commenced about 1869. This date also marks the beginning of the live-stock industry upon the Laramie Plains. While the adaptability of the country for stock raising had long been recognized, its remoteness from markets and the presence of hostile Indians materially retarded development. The completion of the Union Pacific Railroad as far as Laramie, in 1868, helped to remove these difficulties, and many persons immediately engaged in the stock business. Cattle were at first allowed to shift for themselves, both winter and summer, without other attention than the annual round-up, but heavy losses during severe winter weather from cold and starvation soon convinced many of the more progressive cattle owners of the necessity of providing forage for winter feeding. They

therefore began to acquire tracts of land along the stream bottoms subject to annual overflow, from which they cut small quantities of native hay. The first of such ranches along Sand Creek was that belonging to Charles Hutton. His ranch extended for some distance along the Laramie River and embraced merely that portion of the Sand Creek bottoms immediately adjacent to that river. Probably 1,000 acres were irrigated from Sand Creek. The method of irrigation was simple. Dams of timber and of brush and rock were built in the creek and the water raised till, by the aid of wing dams on either side of the channel, it was spread out over the creek bottoms, which in many places are quite flat. The hay grown upon these meadows was stacked in the field and in winter was fed to cattle in the open. The history of the locality follows that of similar localities throughout Wyoming. The owner of the original ranch, by investing too heavily in cattle during the inflation in the price of live stock in the few years following 1880, became bankrupt when the general collapse in prices came in 1884. The original ranch was divided up into a number of smaller holdings, other ranches were established upon the stream above the first, and with the increase in population and the depletion of natural pasturage the great stretch of free range on either side of the creek was gradually fenced in.

The resources and possibilities of the region in the line of agriculture are limited almost entirely to the raising of forage for the winter feed of cattle. Stock raising necessarily is and must continue the main industry. The altitudes of the ranches are from 7,500 to 9,000 feet above sea level. The winters are long, dry, and cold. The summers are short, with hot days and cold nights. Frost may be expected any month in the year. The annual rainfall in the cultivated portions is not much over 10 inches in depth, of which half often falls during the fall and winter months. Nothing can be grown without irrigation, and the crops capable of growth under irrigation are limited to the more hardy cereals, potatoes, and forage crops, such as peas, roots, alfalfa, and native hay.

In such a district as this, where the industry is of the simplest character, it might be expected that the economic questions confronting the landholders would likewise be simple. As a matter of fact, however, the questions are many and perplexing. The industry being stock raising, the question of first importance must, of course, be that of providing food for stock. Forage crops having to be grown under irrigation, the usual question is encountered as to the most equitable means of distributing water, and this question will be equaled in importance in a few years by that of how best to utilize the water supply which is constantly increasing in value. Of great importance in the district at present is the question of the interstate water rights. A case involving such rights is now pending in the United States courts.

1336

The range problem is also one which vitally concerns not only this particular district, but also like localities in all parts of Wyoming to-day. Many of these problems can never be solved satisfactorily by the people themselves, because of the numerous complications involved, and must ultimately depend for their complete solution upon action by the State and Federal governments.

THE WATER SUPPLY.

CHARACTER OF THE WATERSHED AND RAINFALL.

As shown by the map (Pl. VI), Sand Creek rises in a very mountainous country. The upper slopes of the mountains, being at an elevation of from 9,000 to 11,000 feet and as yet not devastated by fire, are covered with a very thick and continuous forest growth. The snowfall being large, these forests aid materially in keeping up the summer flow of the stream. That portion of the watershed lying in Wyoming and a small part of that in Colorado are entirely destitute of forest growth, or, in fact, of any vegetation whatever, except the small amount of grass and sagebrush growing on the hill slopes. Rains in the lower portions of the watershed are therefore accompanied by almost immediate rises in the stream.

Of the annual precipitation in the mountainous portion of the watershed no data is extant, but it probably differs but little from that determined at the places noted,[1] which is on the average about 16 inches. The precipitation in the lower portions of the watershed probably does not differ greatly from that at Laramie, about 15 miles distant. At Laramie the average annual precipitation during a period of eleven years has been 10.5 inches.

The area of the mountainous portion of the watershed is about 36.25 square miles, of the remainder about 47.5 square miles.

FLOW OF THE STREAM.

Unfortunately no data are available on the flow of the stream previous to this year. Two gaging stations were established upon the creek in October of 1901, at which daily gage readings were made from that time up to October of 1902. The first of these stations was established a short distance below the Colorado-Wyoming line, practically above all the irrigated land in Wyoming. The other was established as near the mouth of the creek as possible. By reason of the character of the channel it had, however, to be placed above the Hoge ranch, the largest on the stream. In the following table are given

[1] Average precipitation at Longs Peak station during five years, 19.48 inches. Average precipitation at Meeker station, Colo., during eleven years, 17.48 inches. Average precipitation at Watrous's station, Colo., during five years, 19.09 inches. (See U. S. Dept. Agr., Climate and Crop Service, Bul. 118.)

the discharges of the creek at each of the gaging stations in acre-feet per month during the time that gagings were made. The past season was exceptionally dry, and the flow of the creek was further diminished by recent diversions of its waters above the gaging stations. The flow as given by the table does not, therefore, represent the average in normal years, but rather the lowest extreme. It is quite probable that the stream never gets lower than it did during the season of 1902.

Total monthly discharge of Sand Creek from October, 1901, to September, 1902.

Month.	Upper station.	Lower station.	Month.	Upper station.	Lower station.
1901.	*Acre-feet.*	*Acre-feet.*	1902—Continued.	*Acre-feet.*	*Acre-feet.*
October	207.53	223.00	March	150.00	250.00
November	209.57	505.53	April	521.80	416.29
December	100.00	150.00	May	1,044.60	369.19
			June	168.90	211.00
1902.			July	117.02	118.40
January	100.00	150.00	August	62.20	55.60
February	150.00	200.00	September	64.20	61.00

STORAGE POSSIBILITIES.

Intimately connected with the consideration of the water supply is the question of storage sites, and particularly is this question of interest in the district under consideration because of the shortage of water last summer and the possibility of a recurrence of the condition in the future.

For the first 15 miles of its length Sand Creek has a very rapid fall, and water could be stored only at great expense by reason of the height of dam required. After passing the Wyoming-Colorado boundary, however, the fall is greatly diminished and it is a few miles north of the boundary line that the first reservoir site is found. The site was surveyed by the writer, and seems to present unusual opportunities for storing a comparatively large body of water at small expense. With a 45-foot dam the capacity would be 2,500 acre-feet, and with a slight increase in height of dam the capacity could be greatly increased. The dam would have to be of composite character, rock-filled with earth facing, both of which materials could be found on the site. Assuming an average flow of 500 acre-feet per month in normal seasons, it is seen that about five months' flow of the stream would be required to fill the reservoir.

Another site is found farther down the stream in one of the natural basins common on the Laramie plains. This site, while not requiring as high a dam, would, it is thought, require quite as expensive operations to get the water out after once impounding it as it would to construct the dam at the previous site. The estimated capacity of this site is 1,000 acre-feet. Other sites are found farther down the stream, but too far down to be of material benefit to the users of Sand

1337

Creek water. It must be expected, however, that any reservoir in the Sand Creek Valley will suffer large losses by seepage because of the porous character of the soil and rock. The prevailing geological formation in the valley is a light and very porous sandstone, which disintegrates rapidly upon exposure to moisture.

DISTRIBUTION AND USE OF WATER.

WATER RIGHTS.

Water rights upon Sand Creek have not, up to the present time, been established in accordance with the Wyoming statutes. In 1894 the State board of control undertook the determination of rights on the stream, and to that end the claims of the several appropriators were filed, the ditches surveyed and mapped, and the areas of land under each of the ditches found. The stream priorities of the several ditches were also established. Sand Creek is, however, a tributary of the Laramie River, upon which the water rights have not yet been adjudicated. Contests were filed against the claims of the Sand Creek appropriators by claimants on the Laramie River, and consequently the rights on Sand Creek could not be finally and officially established prior to the adjudication of rights on the main stream.

The following table gives the result of the adjudication of the rights on Sand Creek made by the State board of control in 1894:

1228

Under the provisions of a law passed by the Wyoming legislature in 1903, water rights can be established on a tributary prior to the adjudication of rights upon the main stream, but are subject to contest by claimants of earlier rights upon the main stream. This will allow of the final establishment of Sand Creek rights at an early date, subject, of course, to future contest by earlier appropriators on the Laramie River.

No water commissioner has, up to the present time, had jurisdiction upon Sand Creek. Conditions found in the district can not, therefore, be said to be indicative of the advantages or defects of the Wyoming law relating to the distribution of water in its practical working. Up to the past season no very serious scarcity of water has been experienced. Each appropriator has been able to get sufficient water to mature his crops, though probably in many instances it was not all he would have desired to use. As has been said, however, the season of 1902 was characterized by an unusual scarcity of water. Under such a condition the disadvantage of having no disinterested person to apportion the water upon some established basis became plainly apparent. While there is a tacit understanding and recognition of their respective rights by the several ranchmen, but little attempt was made by any of them to limit the amount of water he diverted from the stream. Being bound together by a more or less close community of interest, the ranchmen with earlier rights were not eager to enforce these rights against their neighbors, and the consequence was that some of the later appropriators obtained water to which technically they had no title. It is doubtful, however, if conditions would have been greatly different if a water commissioner had been given control of the distribution of the supply. In other districts with which the writer is acquainted nearly the same conditions prevail. Water has not become so scarce that its value is very highly appreciated. It is seldom measured at its point of diversion from the stream, and when measured, the methods in most instances are crude and inaccurate. The water commissioner is usually a resident of the district over which he has jurisdiction. By too strict and conscientious an observance of his duties he is liable to get into disrepute with those of his neighbors who possess inferior rights, and, on the other hand, if not strict enough he will incur the enmity of the owners of early rights. The position is usually one in which a neutral course is impossible, or at best very hard to maintain, and the compensation is insufficient to justify a man in neglecting his private affairs to give his undivided attention to the settlement of those difficulties which arise. The situation therefore becomes so entirely unpleasant for him that unless he be a man of unusual hardihood and determination he usually gives up the office. Such a state of affairs is naturally very detrimental to the interests of the community and would tend in the end to defeat one of the objects

13259

upon which the Wyoming law is based—that is, the equitable division of water according to vested rights.

One problem which must be solved before any method of distribution can be rendered effective is to find the proper amount of water to apply to hay meadows.

DUTY OF WATER.

During the past season a beginning was made in the determination of the amount of water actually used upon hay meadows. It is necessary to repeat, however, that the results show conditions in dry years rather than during ordinary seasons, and can not therefore be made the basis of very trustworthy conclusions as to normal conditions. As before stated, two stations were established upon the stream at which continuous measurements were made during the season. Between these stations seven ditches are taken out. It was thought that by keeping a continuous gaging of the flow in each of the ditches and likewise of the flow of the stream at the two gaging stations a very close determination of the amount of water used could be obtained. Arrangements were made with ranchmen living near the head gates of the different ditches to make gage readings at frequent intervals, particularly when for any reason the flow in the ditch increased or decreased. The several gentlemen with whom the arrangement was made conscientiously performed their part of the work, and it is thought that the results are fairly accurate. The measurements were made by weirs in cases where the necessary fall could be obtained, but as in most of the ditches the fall is very slight a section of the ditch about 25 feet long was straightened and evened on either side of the gage, and a number of measurements made by current meter with different depths of water in the ditch, a rating thus being obtained.

The total daily discharge in the seven ditches is shown graphically in fig. 3.

The following table gives the flow in all of the ditches mentioned:

Discharge of ditches between Upper and Lower gaging stations, Sand Creek, Wyoming.

Ditch.	Discharge in acre-feet.				Total.	Area under ditch.[a]	Acre-feet per acre.
	April.	May.	June.	July.			
						Acres.	
Lundquist	0.00	33.49	18.96	0.00	52.45	132	0.40
Kendall	29.50	153.49	33.48	35.49	251.96	398	.63
Lone Tree	14.00	447.50	69.20	57.12	577.82	786	1.45
Davis & Hardman	.00	81.39	.00	.00	81.39	480	.17
Davis	.00	66.84	15.00	.00	81.84	256	.32
Hardman	53.20	229.61	101.72	9.00	394.13	127	3.10
Leroy	.00	109.64	.00	.00	109.64	605	.18
Total	96.70	1,121.96	228.36	102.21	1,549.23	2,786	

[a] Total area under ditch. Actual area to which water was applied impossible of determination.

From the above data it is seen that 1,549.23 acre-feet was diverted from Sand Creek and used in the seven ditches in which measurements were made. From data supplied by the ranchmen whose lands are watered by these ditches it is found that the yield of hay was approximately 160 tons. Probably much more could have been grown had the same amount of water been supplied to a smaller area. As each man had to have some share of the supply it was distributed over such a large area that it did little good anywhere. In most cases a growth of grass was obtained which would make winter pasturage for cattle. As calculated from the above data the average depth to which water was applied to the land was 0.646 foot or 7.75 inches. Meadow hay estimated upon the value returned in feeding cattle is worth about $10

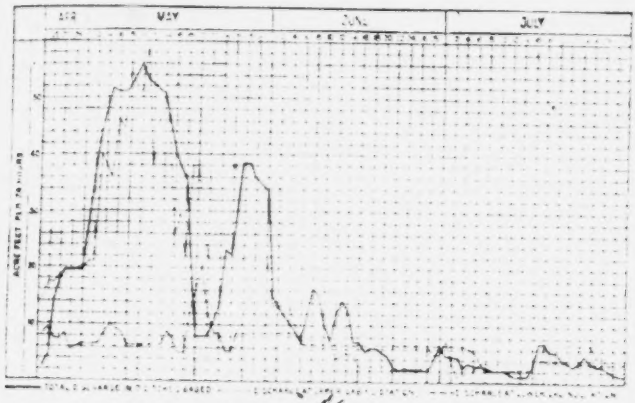

FIG. 3.—Diagram showing discharge of ditches from Sand Creek.

per ton. Upon this basis the value of water per acre-foot is seen to be about $1. Low as this may appear to be it is probably not far from the average value returned from the use of water upon such lands. The Hardman Ditch has the earliest right upon the stream. During the past season its flow was probably more nearly at the normal than any of the other ditches. As can be seen from the above table a total amount of 394.13 acre-feet was used under this ditch during the season. The area irrigated was about 127 acres. Undoubtedly much of the water applied almost immediately returned to the stream, as the land borders upon the creek and the soil is of a very porous character. Based upon actual measurements the total depth to which water was applied was 3.10 feet. The yield of hay from this area of 127 acres was about 20 tons. Its value would be about $200, which would give

1540

to water used upon this meadow a value of about 50 cents per acre-foot. The above yield is far below the average, although the amount of water used was about the same as during average years. Mr. Hardman explains the circumstance as the result of his having had to shut off the water for about ten days during the month of May. He states that the grass then received a setback from which it failed to recover. The usual crop is in the neighborhood of 1 ton to the acre, which would make the value of the water in normal years about six times that found above.

It would seem, however, that none of these results represent the value of water as used in the entire district according to the estimates of the pecuniary loss due to the shortage of water during the past season. But, whatever may be the value of water so used, from an economic standpoint the present method of using water upon the hay meadows appears to be extremely wasteful. The land is seldom if ever smoothed and leveled to facilitate irrigation. Contour ditches are often run to the higher knolls, but the usual practice is to bring the water to the highest portions of the land irrigated and then let it run for several weeks continuously without attention. The natural result is that the low-lying portions of the meadow are flooded, while the higher portions are left completely dry except for such moisture as rises from the lower portions. Many of the meadows were originally range or dry pasture lands which have been transformed into meadows by the application of water. The native grasses which are common to such land, and which probably would be greatly stimulated to growth by a moderate amount of water, are literally "drowned out" by the excessive amounts applied in actual practice. These native grasses, such as needle grass, prairie June grass, and various species of blue and wheat grasses, are very nutritious and valuable as forage, but they can not thrive in the presence of such an excess of moisture, and their places are taken by vegetation suited to moist and alkaline conditions. Such are foxtail, tussock grass, alkali meadow grass, weeds of little or no value, as parsnip, plantain, Beckmannia, alkali sacaton, etc., while in the continually wet places sedges of various species, wire grass, and bulrushes thrive. The latter class of vegetation certainly makes anything but desirable hay, yet the endeavor of nearly all irrigators is to put such an amount of water upon their meadows as will completely submerge, or at least thoroughly soak, the entire area, high places included. Unless this can be done complaints are heard over the shortage of water. Undoubtedly this flooding tends to give a quantity of hay and there are some who claim that excessive amounts of water are necessary to grow any crop whatever at high elevations. While this must be true to some extent, it certainly would appear that a smaller quantity of better hay to the acre than now grown would be something very desirable, and it is possible that a meadow irrigated with moderate amounts of water and with

some care and attention in irrigation might in the end give as high a yield of the more valuable grasses as it now does of weeds, sedges, and rushes. As many of the meadows along Sand Creek have been irrigated in the manner described for a number of years and as the vegetation is of the moisture-loving variety, a scarcity of water such as that experienced during the past season results in a greatly diminished yield of hay.

DITCHES.

Undoubtedly much of the difficulty experienced in the distribution and economical use of water in districts similar to the one under consideration results from the fact that each ranchman owns and controls his own ditch system. Several ditches are often built upon one ranch, each irrigating from 50 to 200 acres. The total length of ditches in the whole Sand Creek district amounts to only 32.5 miles, being no more than a system of laterals under some large canal. Yet each ditch, however small, has its own separate priority, and its control must be subject to the same State supervision as would a large canal. The same problems of water administration are therefore encountered upon Sand Creek as would be met with upon a stream of ten times its size and importance.

The system of small separate ditches results in the double disadvantages of limiting the area capable of irrigation and a low duty of water. Through most of its length in Wyoming Sand Creek has an unusually slight fall; so that in order to irrigate relatively small areas a long length of ditch is required. As ditch construction is expensive, the area which a ranchman is able to reclaim by his own efforts is necessarily small. A line of main canal or ditch on either side of the valley, diverting water from the creek near the point where it empties into the valley, besides commanding the land now watered, would make it possible to irrigate a much larger area. Built on the cooperative plan, as in other portions of the West, and under cooperative management, such a system would also allow of greater economy in the use of water through distribution in rotation. Such a project, although favored by a few ranchmen who see its advantages, is opposed by the majority, who are disinclined to abandon their present ditches and water rights and who fear the advantages to be gained will not be commensurate with the expense of such an undertaking. In the near future, however, it is probable that some more effective means of distribution, together with storage of the remaining water supply, must be resorted to. The ditches in the Wyoming portion of the district are worthy of but very brief mention. The largest, the Lone Tree Ditch, is but 10 feet wide and 2 feet deep. The grades of the various ditches are from 4 to 10 feet per mile. No irrigation structures of interest or importance are found. A few of the ditches have no headgates, little or no regulation being made. No measuring weirs or flumes are found in the district.

1341

SEEPAGE.

Seepage undoubtedly has much to do with the duty of water and with the distribution of water from the stream. The soil being of a porous character, it is to be expected that the seepage gains and losses will be large, and this is what was found by a series of measurements made the past season.

The diagram (fig. 3, p. 110) shows graphically the total flow of the different ditches previously mentioned, as well as the flow of Sand Creek at the upper and lower gaging stations, from the 25th of April, at which time irrigation started, to the end of July. This diagram shows that on several dates the amount of water used by the different ditches exceeded by several acre-feet that passing the upper gaging station, while at the same time a small amount was flowing at the lower gaging station. It has been explained that the soil is very porous and that much of the land irrigated is in the stream bottoms or upon the hillsides immediately adjacent to the creek. Much of the water applied to the land probably returns to the stream and becomes immediately available for the use of ditches diverting water lower down. To determine to what extent this occurs measurements were made of the flow of Sand Creek just above and just below the meadow of Mr. Hardman. We have elsewhere stated that the use of water upon this meadow more nearly represented the ordinary use than did any other upon the stream during the past season. It must be expected, therefore, that such results as were obtained from the seepage measurements would likewise be representative.

The results are shown in the following table:

[illegible]

The first set of these measurements was made soon after water was turned on the meadow, and it is probable that the ground had not become sufficiently saturated to cause much seepage. The second set was made some time after water had been turned on and shows a large increase in the ratio of seepage to the amount of water applied. The third set was made when the meadow was dry, and consequently there was only a very slight difference between the two measurements.

In addition to the above, three series of measurements were made to determine the effect of seepage upon the stream flow in a certain length through the valley. In the section selected, which was about 18 miles in length, no visible inflow from tributary streams occurred during the progress of the respective measurements. The results are shown in fig. 4. This diagram shows the net gain or loss between the respective points of measurement. All diversions have been subtracted.

The first measurements of the series were made on May 25. At this

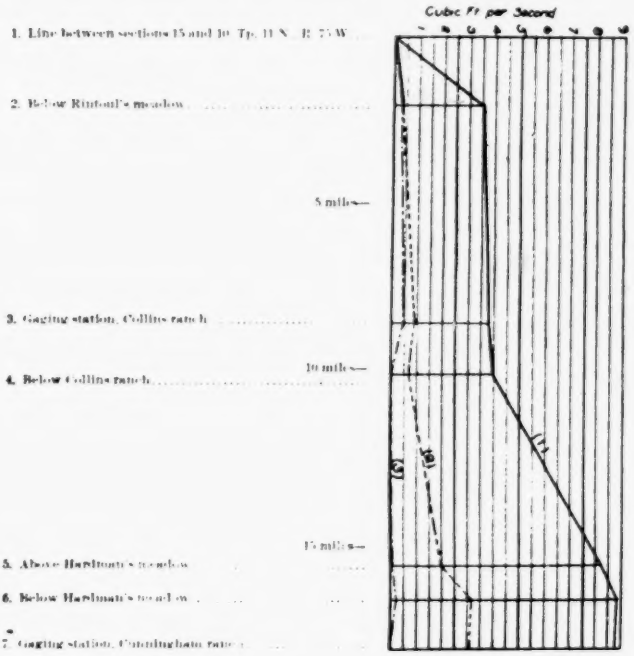

FIG. 4.—Diagram showing seepage gains and losses in flow of sand Creek.

time water was being used very generally throughout the valley in large quantities and the seepage, as shown by the diagram, is correspondingly large. The second set, being taken in the season when water was not so abundant, shows a corresponding decrease in the seepage, and the last, taken when but little water was being used, indicates that very little water was returning to the stream. Between the three measurements there seems to be a very satisfactory correspondence, so that the results are probably accurate.

1342

The above considerations seem to show quite conclusively that were it not for the fact that a great deal of the water used returns to the stream the area which could be irrigated would be much smaller. As we have elsewhere stated, no data is available as to the flow of the stream in normal seasons. From the high-water marks and from the testimony of the residents of the district as to the levels attained by the stream in flood time we are, however, able to estimate that the flood discharge is probably between 75 and 100 cubic feet per second. Upon the legal basis of 70 acres per second-foot (which we have reason to believe is too high a duty for this district) the total area capable of being irrigated in flood time would be only about 6,000 acres. The actual area under ditches is about 5,000 acres, from which it is seen that the flow of some of the lower ditches in dry or even in normal years must be made up almost entirely of seepage water.

THE INTERSTATE WATER-RIGHT PROBLEM.

The legal phase of the irrigation problem in this district is of unusual interest and importance. It involves the question of interstate rights, a question which is very intimately connected with future irrigation development on many of the larger streams of the West.

As may be seen from the accompanying map (Pl. VI), Sand Creek rises in Colorado and about half of its course lies in that State. Nearly all of the irrigated land, however, lies in Wyoming. Much of this land has been under irrigation since 1878, and a smaller portion since about 1870.

Nearly all of the land lying in Colorado watered from Sand Creek has been under irrigation for probably not over ten years, though a small portion has been watered for perhaps twenty years. The irrigation of this land has never very seriously interfered with the use of water by the Sand Creek appropriators in Wyoming. The land irrigated has a steep slope toward the stream, and the return seepage is large, as shown by the diagram (fig. 4, p. 114), in which the seepage gains from these lands are shown between points 1 and 3. Although the use of water by the Colorado appropriators might diminish the present flow of the stream, the ultimate result would be that the drainage from these lands would tend to sustain the flow later in the season, probably, however, too late to be of material aid in irrigation. This influence of seepage has been recognized by the Sand Creek ranchmen, and consequently no complaint has been raised previous to this time against the use of the waters of the stream by these Colorado appropriators, although their rights are inferior in time to those of many of the ranchmen along Sand Creek in Wyoming.

In May of 1902, however, a canal was completed high up on a stream in Colorado by which it was made possible to divert the entire

flow of Sand Creek at the point of diversion and empty it into Sheep Creek, a tributary of the Cache la Poudre River, an important Colorado stream lying in the drainage basin of the South Platte River. (Pl. VII.) The water diverted from Sand Creek is subsequently diverted from the Cache la Poudre River and stored in a reservoir from which it is afterwards drawn to irrigate beet lands in the vicinity of Fort Collins. The ditch thus connecting the two watersheds is called the Divide Ditch. Although this year the flow of Sand Creek alone has been utilized, the works have now been completed by which during the coming season the headwaters of a number of streams tributary to the Laramie River will be diverted into the Sand Creek watershed and then with Sand Creek water emptied into the watershed of the Cache la Poudre. The chain of ditches by which this unique scheme is carried out is shown on the accompanying map. (Pl. VI, p. 100.) As will be seen by the map, the whole system lies in Colorado. The water is both diverted and used in that State.

It is of course evident that this diversion of water from one watershed to another brings about a number of complications of a legal nature. The Sand Creek water and also that flowing into the Laramie River by other channels has already been appropriated and put to beneficial use by both Wyoming and Colorado citizens whose ranches are situated upon the streams in question below the respective points of diversion of the ditches mentioned. While the Colorado appropriators whose interests are thus affected have redress in the courts of their own State, the Wyoming citizens have no means of maintaining their rights except by an appeal to the United States courts. Such an appeal has been made by the Sand Creek landholders whose interests are affected. The following is extracted from the bill of complaint filed by their counsel:

> In 1867 and the succeeding years and long prior to the acts of the defendants hereinafter complained of the plaintiffs and their respective grantors began to cultivate their said lands and to produce and harvest crops of grass and hay and other crops thereupon, originally by natural irrigation from the waters of Sand Creek, and later by artificial diversions by means of dams, ditches, flumes, and other works made for the purpose of extending and improving the irrigation of such lands and by such and other means of diversion and by the application of the waters of said creek to the soil, and through the cultivation thereof the plaintiffs and their respective grantors made appropriations and acquired rights prior in time to those of the defendants to the use of all of the waters of Sand Creek, which appropriations and rights they have maintained up to the present time, and of which they are now in possession and enjoyment except as interrupted by the wrongful acts of the defendants hereinafter complained of.
>
> Adjacent to the irrigated lands of the plaintiffs are large areas of arid pastoral lands both in public and private ownership, upon which the cattle of the plaintiffs and their grantors have been accustomed to range and graze from 1867, being dependent for the use of such pasturage upon the access to the running waters of said creek, without which the pastoral lands aforesaid would be largely inaccessible and useless.
>
> From 1867 the plaintiffs and their grantors have been accustomed to draw their

FIG. 1.—HEAD GATE AND DAM OF DIVIDE DITCH

FIG. 2.—VIEW OF DIVIDE DITCH, SHOWING LOSS BY SEEPAGE

water supply for domestic purposes from said creek, and the plaintiffs are now largely dependent upon such source of supply.

The defendants, on or about May 1, 1902, and at divers times from that date to the filing of this bill, have, by means of dams and ditches and otherwise, wrongfully and unlawfully obstructed and diverted the flow of the waters of said creek and its tributaries and drainage basin, the common source of supply, and intercepted the melting snows and the floods and rains of said drainage basin and led them away from the channel and in some instances from the drainage basin of said creek and wasted and applied them to other uses, thereby cutting off the flow of the said stream into Wyoming and to the plaintiffs' ditches and lands and depriving the plaintiffs of all use of said waters; and the defendants still repeat and continue and threaten to further and permanently repeat and continue their said wrongful and unlawful acts to the permanent injury and deprivation of the plaintiffs' source of supply, and, unless restrained by the order of this court, the defendants will thus further and permanently injure and deprive the plaintiffs of their said source of supply.

The diversions and applications of water by the plaintiffs, as aforesaid, are wholly within the State of Wyoming, and the diversions and applications of water aforesaid by the defendants are wholly within the State of Colorado.

The plaintiffs are informed and verily believe that the defendants claim and pretend, by reason of the interstate character of said stream and by reason of the diversity of citizenship and the location of lands of the plaintiffs and those of the defendants in different States, that the defendants have the right to wholly exclude the plaintiffs from the use of the waters of said creek and to take and apply and appropriate, in Colorado, all of the waters of said creek in disregard and exclusion of the vested and acquired prior rights of the plaintiffs aforesaid, and the defendants deny and dispute all rights of the plaintiffs to make any appropriation or use of the waters of said creek without the limits of Colorado, and claim all of the said waters as lands granted by the constitution and laws of Colorado exclusively to the citizens and occupants of lands in said State.

The plaintiffs have no other practicable or available supply of water, and the aforesaid obstructions and diversions by the defendants of the waters of said creek have deprived and now deprive and will, if repeated or continued, further deprive the plaintiffs of the necessary supply of water for their cattle and for the irrigation of their lands and for domestic uses, and have greatly reduced the growth of crops and will, if repeated or continued, cause the plaintiffs' irrigated lands to deteriorate and relapse into a state of aridity and barrenness which will wholly or largely destroy their value and thus deprive the plaintiffs of their property, and will, if further repeated or continued, render the pastoral lands aforesaid, both of public and private ownership, inaccessible and useless for grazing purposes.

The complaint asks to have the defendants cited to show what rights they claim and also to have them restrained from future diversion of water.

It is, of course, outside of the province of this report to discuss the respective rights of the parties to this suit. That the Wyoming ranchmen have just grounds of complaint can not, however, be denied. Although they have been settled upon the stream a sufficient length of time to acquire rights which would hold against parties diverting water above them were the stream entirely within their own State, in this case they suddenly find themselves deprived of a large portion of the waters of the stream upon which their prosperity almost entirely depends, and they have no means of redress except by an appeal to the Federal courts. The damage sustained by them through the diversion of the waters of the stream is difficult of determination. From

the data at hand it is, however, comparatively easy to arrive at an approximation to the truth.

As the Divide Ditch alone was completed during the past season no water was diverted from the other streams flowing into the Laramie River. As we have stated elsewhere, the shortage of water during the past season was due not only to this diversion of Sand Creek water by Colorado parties, but also to an unusually dry season. From January 1 to June 28 there was little or no rainfall, and, to make matters worse, there was only a very slight amount of snow stored in the mountains and it was almost entirely melted by the end of May. The precipitation from October 1, 1901, at which time the investigation was started, up to October 1, 1902, is given in the following table, as well as an average for the same period during a previous ten years.

Rainfall at Laramie, Wyo., from October, 1901, to September, 1902, inclusive.

Month.	1901-1902.	Average previous ten years.*	Month.	1901-1902.	Average previous ten years.*

November	.00	.27	June (12, 0.03; 28, 0.49; 29, 0.08)	.60	1.20
December	.21	.36	July	1.49	1.47
1902.			August	.40	1.06
January	Trace.	.27	September	1.58	.67
February	.28	.34			
March	.41	.97	Total	7.29	10.49
April	.80	1.31			

* Excluding 1901, for which records are incomplete.

From this table it is seen that the rainfall during the period under consideration has been about three-fourths the mean of the previous ten years. It is seen further that from March to July, 1902, a period during which rain is much needed, both for irrigation and for the ranges, that there was only 1.66 inches of rainfall against a normal of 4.25 inches during the previous years, and that of this 1.66 inches 0.57 inch fell on June 28 and 29, too late to do much good to the hay meadows.

These figures are from the records of the meteorological department of the University of Wyoming, which is near enough the district under discussion to make the data probably very nearly correct for that locality.

The relative effect of the two causes mentioned on the shortage of water this season can not be stated with any exactness. The water diverted by the Divide Ditch is, of course, lost to the users of water farther downstream. As it is carried to another watershed only the small amount lost in transit prior to the ditch reaching the other watershed can return to the stream by seepage. The flow of Sand Creek was undoubtedly affected also by the reduced flow, due to shortage in

1345

precipitation of several large feeders entering the stream below the head of Divide Ditch.

The variation in the discharge at the upper gaging station when the head gates of the ditch were opened or closed give some idea of the influence exerted upon the flow of Sand Creek by the use of Divide Ditch. On May 9 the water was turned into the Divide Ditch for the first time. On May 11 the discharge at the upper rating flume on the creek was 59 acre-feet per day. On May 12 the discharge fell to 38 acre-feet per day.

In the following table is given a record of the flow of the Divide Ditch from May 9 to July 1, 1902. These figures were obtained by the daily gage readings at the lower end of the ditch just before it discharges into Sheep Creek. From May 9 to June 10, inclusive, measurements were made by means of a rectangular weir of rather imperfect construction. On June 10 a rating flume was installed, in which the measurements were afterwards made.

Total	.....	976.12	.....	394.36	.....	23.01

As shown by the table, a total of 1,393.49 acre-feet of water was diverted from Sand Creek and emptied into Cache la Poudre watershed in 1902. This amounts to about 60,700,000 cubic feet. The value of this water as sold in Colorado is $100 per 1,000,000 cubic

feet, which would mean that the water thus diverted was worth $6,070 to the owners of the Divide Ditch. This water would have had much less value as used in Wyoming. As shown on page 110 the average value of an acre-foot of water used in the Sand Creek district is not far from $1, figured from the yield per acre in hay. On this basis the Wyoming appropriators sustained a loss of $1,393.49. This is not, however, the only loss. It is not only the damage resulting from the shortage in the hay crop that must be considered, but also the permanent depreciation in the value of the land resulting from the lack of water for its irrigation. Land under irrigation is valued by the Sand Creek ranchmen at from $10 to $25 per acre. The average value as placed by them is $15 per acre. Land without water they value at about $2 per acre; fencing they value at $50 per mile, which would make the value of an acre in a fenced but unirrigated section about $2.30. Thus there would be a depreciation of $12.70 per acre in the value of land should the water supply be entirely cut off. We have elsewhere explained that it was quite impossible to make any determination of the actual area to which water was applied because of the unequal and uneven manner in which the land was irrigated. Water was let into all of the ditches ordinarily used, so that under none of them could it be said that absolutely no water was applied to the land. It is therefore utterly impossible to determine just how much land was without water during the past season. The only way in which it is possible to make even an estimate is to assume that the entire area under ditches could have been irrigated had the water diverted by the Divide Ditch been available for the use of the Sand Creek ranchmen. By a proportion between the amount of water actually available, that which would have been available had the Divide Ditch not been built, and the total area under ditches in the Wyoming portion of the district we may arrive at some approximation to the truth. The total area under ditches is about 5,000 acres. The amount of water which entered the upper portion of the valley from the 1st of April to the last of June, at which time irrigation may be considered to have ended, was 1,735.99 acre-feet. The amount of water diverted by the Divide Ditch during the same period was 1,370.48 acre-feet. The total amount of water which would have been available, therefore, was 3,106.47 acre-feet. By proportion, the amount of land which probably was irrigated the past season is found to be 2,794 acres. This means that 2,206 acres were without water. If the past season be taken as typical and the decrease in the water supply as permanent, then, on a basis of depreciation of $12.70, there was a loss of $28,016.20.

Combining the permanent depreciation of $28,016.20 in the value of land that was deprived of water with the loss for the season of $1,393.49, the value of the 1,393.49 acre-feet diverted, it is seen that

the total loss caused by the Divide Ditch diversion estimated at the close of the season of 1902 was $29,469.69. This loss is surprising when it is considered that it occurred in a district where the total assessed valuation of real estate and improvements is only $112,000.

RANGE PROBLEMS.

On Sand Creek, as indeed nearly everywhere throughout the State of Wyoming at the present time, the question of the use and control of the grazing lands adjacent to the stream is of the greatest complexity and importance and the situation is one demanding the early attention of our legislative bodies.

It is unnecessary to dwell at much length upon the present condition of the ranges or the causes by which the present situation has been brought about, as the facts are widely known. In this district, as elsewhere, the entire difficulty may be said to have originated in the short-sighted endeavor of the early stockmen to make the most of the "free grass" while it lasted, regardless of consequences. During the "boom times" of the cattle business, from 1871 to 1885, stockmen invested in immense herds of cattle, which were allowed to roam at large and which were more in numbers than the range could support without injury. Because of the presence of water easily available for stock the Sand Creek country suffered probably as much injury as any from the excessive trampling and close cropping of the pasturage by the great herds of the speculative stockmen. From this early impoverishment the range has never fully recovered, although after the decline of the range stock industry in the latter half of the eighties the number of cattle occupying the ranges was greatly reduced. According to the testimony of ranchmen who have been in the district since its first settlement, many areas which now have only sparse and scattered growth of vegetation, consisting mostly of cactus, formerly had comparatively thick covering of grass, which, in favorable seasons, grew to the height of a man's knee. The difference between former and present conditions can probably best be realized when it is learned that on areas which formerly could support from 50 to 100 animals per square mile without crowding there is now barely feed enough for 20, or at best 30. Sheep have never been grazed very extensively in this district, so that such damage as has been done is very largely that due to overstocking by cattle. This exhaustion of the natural pasturage, together with the wholesale fencing and use of the remaining public lands by the large cattle owners, has left the ranchmen of moderate means in serious straits for the summer and winter pasturage of their cattle. On some ranches enough hay is grown to feed during the winter many times the number of cattle which can be supported by grazing on the adjacent ranges during the summer.

It is probable that in this locality the range might be restored to its

former condition by artificial seeding and a simple course of cultivation. The most practicable way, however, seems to be to let conditions correct themselves naturally, allowing the few remaining grasses to reseed the denuded areas and protecting the new growth by a careful and conservative system of pasturing. This remedy is evident to most ranchmen, and explains the efforts which now and for some time past they have been making to acquire inclosed tracts of grazing land. From these tracts they are enabled to exclude the cattle of their neighbors, and in them they pasture their own cattle in a way which will be most likely to induce a rapid and permanent improvement in the pasturage. This separate control of grazing areas also allows the improvement of the herds by the use of pure-bred stock, something which would be impossible under the old open-range system.

Ranchmen favor the enactment of some law by which they could lawfully acquire areas of grazing land over which they could exercise control for a term of years sufficiently long to justify them in using such means as are effective in reestablishing the growth of the native grasses. Realizing the great importance of safeguarding the interests of the small stockmen, they believe it to be necessary to prevent the possibility of the large cattle companies gaining a monopoly over large areas of grazing lands. Such an end would, in the opinion of many, be attained by making the area of grazing land obtainable bear a certain proportion to the area of irrigated land; for example, 1 acre of irrigated land should entitle the landowner to 5 acres of grazing land. However, the problem is one of many complexities, and to solve it in a way which shall be satisfactory to all the various interests concerned will be a task of much difficulty.

CONCLUSIONS.

Although many results of the investigations of the past season can not be taken as representative of normal conditions, still it is thought that the following conclusions can safely be drawn:

(1) That in the irrigation of native hay a wasteful and extravagant use is made of water which might be used to better advantage if less were applied, or which, if used in the irrigation of some forage crop such as alfalfa, would give a much larger yield for the same amount of water judiciously applied.

(2) That native hay is probably, however, the only crop which could be grown with profit without storage of the water supply. The period of greatest use in the irrigation of native hay is the period of maximum supply, and the supply becomes exhausted at a time when crops other than native hay most need the water.

(3) That the system of numerous small ditches, besides restricting the area capable of irrigation, produces unnecessary complications in water distribution and favors a low duty of water.

1347-1348

(4) That seepage has a surprising influence in keeping up the flow of ditches whose head gates may be separated by only a few miles of irrigated land.

(5) That by diversion of the headwaters of Sand Creek into another watershed Wyoming irrigators will be deprived of a large portion of the late spring flow of the stream, which comes mainly from the meltings of snow accumulated in the higher valleys of the mountains and is therefore all the more valuable for irrigation.

(6) That conditions of which we have an instance in the Sand Creek district demand immediately some judicial or legislative action defining the respective rights of parties irrigating from the same stream but separated by a State boundary.

(7) That the present depleted condition of the natural pasturage and the trend of the cattle industry toward improved breeds of cattle have rendered obligatory the abolishment of the open range in this district.

(8) That as the area of the homestead and desert land claims are inadequate to support a profitable number of cattle, the adjacent areas of public land should be rendered available by leasing, or some other means, for exclusive use and control by resident landowners, with certain restrictions as to the amount and location of land available.

[fol. 1354] COMP. EXHIBIT NO. 4

Articles of Incorporation of The Laramie-Poudre Irrigation Company

Know All Men by These Presents, that we, the undersigned, H. D. Parker, W. R. Kelly, and O. S. Moore, residents of the State of Colorado, have associated ourselves together as a corporation under the name and style of The Laramie-Poudre Irrigation Company, a mutual irrigation company, for the purpose of becoming a body corporate, under and by virtue of the laws of the State of Colorado, do hereby make, execute and acknowledge, in quadruple, this certificate in writing of our intention to so become a body corporate under and by virtue of said laws.

First. The corporate name and style of our said corporation shall be The Laramie-Poudre Irrigation Company.

Second. Our corporation aforesaid shall be what is commonly known as a mutual irrigation company, not for pecuniary profit, and the waters owned by the company shall be distributed among its stockholders prorata, according to the number of shares of stock owned by each, but subject to the provision of the by-laws of the company as to payment of assessments and distribution of water.

Third. The objects and purposes for which said corporation is formed and incorporated, are to acquire, construct, own, maintain and operate, ditches and reservoirs, and interest therein; to acquire by purchase, condemnation or otherwise, all lands, necessary and proper for rights of way for said ditches and sites for said reservoirs; to acquire by appropriation, purchase, contract, lease, or otherwise, waters for supplying said ditches and filling said reservoirs; to divert and store water in said ditches and reservoirs and distribute the same to the stockholders direct, or by a system of exchange, and to use all water acquired and appropriated for irrigation, domestic, mechanical and other beneficial uses; to acquire interests in ditches and [fol. 1355] reservoirs and appropriations of water, by purchase and ownership of stock in other corporations owning or controlling the same; to construct all dams,

headgates, flumes and appliances necessary and proper to construct, maintain and operate said ditches and reservoirs; to supply water to its stockholders upon such terms as shall be fixed by the by-laws of board of directors of said company; to acquire any existing ditch or reservoir and the appropriations of water therefor, necessary or proper for the purposes of this company; to acquire, own, maintain and operate reservoirs, ditches, dams and other appliances and appropriations of water for the generation of power and other mechanical purposes, and to use the appropriations of water owned or acquired by said company for both irrigation and mechanical purposes; to purchase, acquire, own and hold, all real estate and personal property necessary to carry out and properly conduct the business of said company; to construct or acquire telephone lines, or interests in the line of any other company, by contract, holding of stock, or otherwise; to issue bonds and notes of said company and to secure the payment thereof by mortgage or deed of trust upon any or all of the property of said company, including appropriations of water; and generally, to do and perform all things necessary and proper to carry on the business of said company and to carry out its objects and purposes aforesaid.

Fourth. Among the various ditches and reservoirs and appropriations of water therefor, to be acquired, constructed and owned by said company, are the following:

1. The Rawah Ditch, whose headgate is located in the south bank of Rawah Creek in Section 32, Township 9 North, Range 76, West of the 6th P. M. in Larimer County, Colorado.

2. The Link Lakes, being a group of 14 lakes or reservoirs connected together and located in Township 8 and 9, [fol. 1356] North, of Range 76, West of the 6th P. M., Larimer County, Colorado.

3. The East Fork Reservoir, situate in Section 18, Township 8 North, Range 65, West of the 6th P. M. in Larimer County, Colorado.

4. The Laramie River Tunnel, as now constructed and located, in Sections 7, 8, 9 and 16, in Township 8 North, of Range 75, West of the 6th P. M., in Laramer County, Colorado, together with all its controlling works and other

property at both ends of the tunnel, including what is known as the Tunnel Reservoir at the west portal thereof, and all being connected with the Laramie River and diverting therefrom.

5. Deadman and Nunn Creek Ditch, or The East Side Collecting Ditch, with its headgate in the south bank of Deadman Creek, in Section 31, Township 10 North, Range 75, West of the 6th P. M. in Larimer County, Colorado.

6. The Lower Supply Ditch, or The West Side Collecting Ditch, with its headgate on the south side of Rawah Creek in Section 14, Township 9 North, Range 76, West of the 6th P. M. Larimer County, Colorado.

7. The McIntyre Ditch, with its headgate in the east bank of McIntyre Creek, in Section 31, Township 9 North, of Range 76 West of the 6th P. M., in Larimer County, Colorado.

8. Appropriations of water, from the Laramie River and tributaries thereof in Water District No. 48, pertaining to each and all of the above ditches and reservoirs, together with the following ditches taking water from the Laramie River and its tributaries in Water District No. 48, and their appropriations of water decreed thereto: to-wit: Priority No. 1 awarded to the Mansfield Ditch. Priority No. 2 awarded to Hills Ditch. Priority No. 3, awarded to the Warren Ditch. Priority No. 5, awarded to the Stuck Creek [fol. 1357] Ditch. Priority No. 7, awarded to Miller & Boswell Ditch. Priority No. 8, awarded to the Mansfield Ditch. Priority No. 9, awarded to the Yelton Ditch. Priority No. 15, awarded to the Smith-Brown Ditch. Priority No. 17, awarded to the Homestead Ditch. Priority No. 24, awarded to the Comet Ditch. Priority No. 27, awarded to the Link Ditch. Priority No. 32, awarded to the Link Ditch No. 2. Priority No. 56, awarded to the Long Park Ditch No. 2, and Priority No. 59, awarded to the Long Park Ditch.

9. Dowdy Lake Reservoir, located in Sections 27 and 34, Township 10 North, of Range 73, Larimer County, Colorado.

10. Twin Lakes Reservoir, located in Section 34, Township 10 north, of Range 73, Larimer County, Colorado.

11. Mitchell Lake System, consisting of Mitchell Lakes Nos. 1, 2, 3, 4, 5, and 6, Deer Lake, Erie Lake, Snake Lake,

and Bellaires Lake, located in Township 10 North, of Range 73, West, Larimer County, Colorado.

12. The North Pine Supply Ditch, having its headgate in the east bank of the North Branch of Lone Pine Creek, in Section 26, Township 10 North, Range 73, West of the 6th P. M., in Larimer County, Colorado.

13. The South Pine Supply Ditch, with its headgate located in the north bank of the South Fork of Lone Pine Creek, in Section 33, Township 10, North, Range 73, West, in Larimer County, Colorado.

14. The Elkhorn Ditch, with its headgate in the north bank of Elkhorn Creek in Section 12, Township 9 North, Range 74, West, in Larimer County, Colorado.

15. The Elkhorn Reservoir, to be a channel reservoir, located in the bed of the Cache la Poudre River, in Townships 8 and 9 North, of Range 72 West, in Larimer County, Colorado.

[fol. 1358] 16. The Poudre Valley Ditch, constructed with its headgate in the north bank of the Cache la Poudre River in Section 10, Township 8 North, Range 70, West, in Larimer County, Colorado, and extending thence in an easterly direction to the south line of Section 36, Township 9 North, Range 69, West, in Larimer County, Colorado.

17. The Greeley-Poudre Canal, located and constructed with its head or initial point at the terminus of the Poudre Valley Ditch in said south line of section 36, and extending thence to McGrew Reservoir in Township 9 North, of Range 65, West; also the Pierce Lateral, as located and constructed with right to enlarge the same; all located part in Larimer and part in Weld County, Colorado.

18. The McGrew Outlet Ditch, extending from McGrew Reservoir to Coal Creek, in Weld County, Colorado.

19. McGrew Reservoir, located on Sections 25, 27, 35 and 36, in Township 9 North, of Range 65, and in Section 1, Township 8 North, Range 65, Weld County, Colorado.

20. Greeley-Poudre Reservoir No. 1, located in Sections 16 and 17, Township 8 North, of Range 67, Weld County, Colorado.

21. March Reservoir, located in Section 18, Township 7 North, of Range 63, and in Sections 12 and 13, Township 7 North, of Range 64, Weld County, Colorado.

22. Dover Reservoir, located in Township 9 North, of Range 66, West, in Weld County, Colorado.

23. Also any and all ditches and reservoirs, appropriations of water, real estate and rights of way, owned by The Greeley-Poudre Irrigation District, in Larimer and Weld Counties.

24. Also any and all appropriations of water initiated, made or perfected, decreed or undecreed, for any of the ditches or reservoirs hereinbefore mentioned.

[fol. 1359] 25. Also any other ditch, canal, lateral or reservoir now constructed or which may hereafter be constructed, with the appropriations of water therefor, made or to be made, and which may become a part of the irrigation system of this company or can be used in connection therewith for augmenting the water supply of its stockholders.

Fifth. The capital stock of our said company shall consist of thirty-two thousand shares, without any par value per share, and said stock when issued fully paid up, shall be non-assessable, except that said stock may be annually assessed for the maintenance and operation of said ditches or reservoirs, and for the purpose of paying any outstanding indebtedness of the company, in the manner by law provided for a mutual not for profit ditch company.

Sixth. That at all meetings of the stockholders of the company the cumulative system of voting shall prevail as now by law provided; and in case of any change in the law, as the law shall then provide.

Seventh. The affairs and management of our said corporation shall be under the control of five (5) directors, and H. D. Parker, O. S. Moore, J. N. Agan, A. A. Edwards, and George M. Houston, are hereby selected to act as said directors and to manage the affairs and concerns of said company during the first year of its existence and until their successors are duly elected and qualified.

Eighth. The operations of our said company will be carried on in the counties of Larimer and Weld in the State of Colorado, and the principal place and business office of said company shall be located in Greeley, Weld County, Colorado.

Ninth. Our said corporation is to exist for the term of twenty (20) years.

Tenth. The directors of said company shall have power [fol. 1360] to make such prudential by-laws as they may deem proper for the management of the affairs of said company, according to the statutes of Colorado in such case made and provided.

In testimony whereof we have hereunto set our hands and seals this first day of August, A. D. 1923.

H. D. Parker, (Seal), W. R. Kelly, (Seal), O. S. Moore, (Seal).

STATE OF COLORADO,
County of Weld, ss:

I, George F. Smith, a Notary Public in and for said County in the State aforesaid, do hereby certify that H. D. Parker, W. R. Kelly, and O. S. Moore, personally known to me to be the persons whose names are subscribed to the foregoing Certificate of Incorporation, appeared before me this day in person and acknowledged that they signed, sealed and delivered the said instrument of writing as their free and voluntary act, for the uses and purposes therein set forth.

Given under my hand and notarial seal this first day of August, A. D. 1923.

George F. Smith, Notary Public. (Seal.)

My commission expires October 16, 1926.

[fol. 1363] COMP. EXHIBIT No. 5

Statement of Claim to Water Right—Irrigation Division Number One, Water District Number 48

STATE OF COLORADO,
County of Larimer, ss:

I, Philip Wilson, the owner of the following described ditch, in compliance with the requirements of the provisions of General Section No. 1720 of the General Statutes of the State of Colorado approved April 20th, 1887, and the acts amendatory thereto, do hereby make this statement for filing:

1. The name of the owner of said ditch is Philip Wilson, whose postoffice address is Fort Collins, County of Larimer.

2. The name of said ditch is the Wilson Supply Ditch.

3. Said ditch is located as shown by plat hereto attached and made a part hereof with head gate at a point on Deadman Creek which bears due north of S. E. corner of Sec. 15, Township 10 N., R. 75 West 750 feet and having gate discharging water into Sand Creek at a point on the south bank thereof which bears due north from the quarter corner on the south side of section nine in township ten north, range seventy five west in said Larimer County, 1480 feet, at which point said Sand Creek assumes a well defined channel; said ditch thence following the bed of said Sand Creek to a point which bears south fifty three degrees west from the quarter corner on the west side of section twenty three in township eleven north, range seventy five west in said Larimer County 370 feet, at which point is located a head gate by which the water hereby appropriated is diverted from said Sand Creek. It being the intention hereby to appropriate all of the water from Deadman Creek which naturally finds its way into the ditch herein described and the water from the streams, valleys and natural depressions intersected by said ditch and lying above the same, and all water of Sand Creek which now reaches the headgate last above described not heretofore appropriated. It being also the intention hereby to divert the water herein appropriated from the watershed of the Big Laramie River

[fol. 1364] into the watershed of the Cache la Poudre River as shown on accompanying plat.

4. The length of said ditch is 7½ miles.

5. The width of said ditch on the bottom is 10 feet, for first 13,145 feet, and 20 feet after leaving Sand Creek.

6. The width at high water line is 16 feet, for first 13,145 feet and 28 feet after leaving Sand Creek.

7. The depth of water carried in said ditch is 3 feet for first 13,145 feet and 4 feet after leaving Sand Creek.

8. The grade of said ditch is 5 feet per mile.

9. The carrying capacity of said ditch is 117 cubic feet per second of time for first 13,145 feet and 288 cu. ft. per second of time after leaving Sand Creek.

10. Work was commenced on said ditch on the eleventh day of June A. D. 1897.

Witness my hand and seal this 21st day of July, A. D. 1897.

(Signed) Philip Wilson.

STATE OF COLORADO,
Larimer County, ss:

March 14th, 1923.

Agnes Zimmerman, Home, Colorado.

DEAR MISS ZIMMERMAN:

Replying to your letter of the 7th inst. in which you ask as to whether or not Laramie and Lost Lakes have been covered by filings.

I have searched through the records and have been unable to find filing covering these specific locations. From available data we have here these lakes are in the Laramie River water shed and at this date would not be subject to appropriation on account of the Wyoming-Colorado water suit.

I am returning the topographic map enclosed in your letter.

Yours very truly, C. C. Hezmalhalch, Chief Clerk.

December 11,1926 SUBJECT:

Miss Agnes Zimmerman,
Home, Colorado.

Dear Miss Zimmerman:-

In further reply to your recent inquiry as to the records of foreign diversions into the Poudre River the past year, we have to advise that we are just in receipt of the automatic register charts on the following streams for the following years:

Grand River Ditch, 1923-1926
Michigan Ditch, 1923-1926
No.Poudre Canal, 1923-1926
Laramie River, 1923-1926
Laramie River Tunnel, 1926
Cameron Pass, 1923-1926
Sand Creek, 1923-1926
Canal No. 3, 1926
Lost Lake, 1923.
Lindermier Outlet, 1923 & 1926
Twin Outlet, 1923 & 1926
Doudy Reed, 1923 & 1926
Bob Creek, 1925-1926
Columbine, 1925&1926

Some of these records are not entirely complete and the records prior to the dates shown hereon have been destroyed according to information furnished by the Water Commissioner of District No. 3.

The records hereinmentioned are on file in this office subject to inspection by you at any time.

Very truly yours,

M C Hinderlider
State Engineer.

SUBJECT Trans-Mt.Diversions,
Dist. # 3

Miss Agnes Zimmerman,
Home, Colo.

Dear Miss Zimmerman:-

Receipt of your letter of the 23rd inst. is herein acknowledged.

Your previous letter requesting information concerning the automatic charts showing the diversions by the Laramie-Poudre Tunnel for 1923,24 and 25, was immediately referred to our Mr. Baily for reply, and upon inquiry I find that this had not been attended to.

Your attention in this regard is invited to our letter addressed to you under date of December 11, 1926, which enumerates the automatic register charts filed in this office up to that time,showing the foreign diversions into the Poudre River.

As stated in that letter,the automatic charts showing diversions through the Laramie-Poudre Tunnel prior to 1926, were destroyed, according to information furnished by the Water Commissioner of District No. 3.

Very truly yours,

M C Hinderlider

State Engineer.

[fol. 1383] COMPLAINANT'S EXHIBIT No. 20

February 27, 1928.

Mr. Robert Follansbee, District Engineer, U. S. G. S., 403 New Post Office Bldg., Denver, Colorado.

DEAR MR. FOLLANSBEE:

After Mr. Hinderlider returns from Washington, please arrange a conference for some forenoon, about 11:00 and I will come down to Denver and in company with yourself, we will talk to Mr. Hinderlider about the measurements of the Trans-mountain diversions between the Laramie and Poudre Rivers.

Am anxious to have this investigation at as early a date as possible.

Very truly yours, John A. Whiting, State Engineer.

February 28, 1928.

Mr. John A. Whiting, State Engineer, Cheyenne, Wyo.

DEAR MR. WHITING:

In reply to your letter of February 27:

Mr. Hinderlider is still in Washington and is not expected back for at least another week. As soon as he returns I shall arrange a conference for you and will notify you of the date.

One meter has been returned by the Washington Office, and the equipment ordered from Gurley is also here so that one complete outfit can be sent you on short notice.

Very truly yours, Robert Follansbee, District Engineer.

[fol. 1385] COMPLAINANT'S EXHIBIT No. 22

(Copy)

March 8th, 1928.

Hon. M. C. Hinderlider, State Engineer of Colorado, Denver, Colorado.

DEAR MR. HINDERLIDER:

Wyoming has long recognized the importance and necessity of a complete inventory of the water resources of the Laramie River. The necessity of this inventory has been forcefully brought to Wyoming's attention within the past month by adverse findings in reports, as to available water supply, for lands enumerated as irrigable in Wyoming water permits of relatively early priority. The adverse findings in said reports have been based upon the large quantity of water alleged as being diverted from the Laramie River Watershed into the Cache La Poudre River Watershed in Colorado, by diversions permissible under the terms of the Modified Final Decree, by the Supreme Court of the United States, dated October 9th, 1922, in the case entitled, The State of Wyoming, Complainant, vs. The State of Colorado, The Greeley Poudre Irrigation District, and The Laramie-Poudre Reservoirs and Irrigation Company.

The Wyoming State Engineer's office, in cooperation with the United States Geological Survey, has operated over a long period of years, gaging stations at several places on the Laramie River within the boundaries of Wyoming. In order to complete the data of the water resource inventory, measurements to determine the quantity of water diverted from the Laramie River Watershed by the Laramie-Poudre trans-mountain diversions, are necessary.

In view of the allegations made in the above mentioned reports, the Wyoming State Engineer's office desires permission in friendly cooperation with yourself, as State Engineer of Colorado, and the United States Geological Survey, without expense to yourself or the State of Colorado, to inventory the quantity of water diverted from the Laramie River Watershed to the Cache La Poudre River Watershed, by trans-mountain diversions, and to jointly ascertain the legal quantity of water to which each trans-mountain

diversion and appropriation is entitled. It is mutually understood that the data, thus jointly obtained, shall be prepared in triplicate, and a copy to be filed with each of the three parties jointly participating in the water inventory.

Wyoming would appreciate your earnest consideration and prompt reply before a possible early run-off occurs.

Very truly yours, John A. Whiting, State Engineer.

JAW:GEE

C. C. to Hon. Frank C. Emerson, Governor of Wyoming; Hon. W. O. Wilson, Attorney General of Wyo.

SUBJECT

Mr. John A. Whiting, State Engineer,
Cheyenne, Wyoming.

Dear Sir:-

I have deferred replying further to your request concerning a cooperative investigation of Laramie River diversions, pending receipt of replies to letters addressed to the owners of those ditch companies which are interested.

I now have replies from such owners, and all express a wish to discuss this matter with you prior to making final decision in this regard.

Due to the inability of representatives of some of these companies to meet before April 5th., I have tentatively set that date for all parties interested to meet in this office at 1:00 o'clock to discuss the matter with you. But before making final decision in this regard it is needful to ascertain if such date will be agreeable to you.

With kind regards, I am

Very truly yours,

M C Hinderlider

State Engineer.

MCH/bc

ANSWERED

MAR 31 1928

STATE ENGINEER

[fol. 1387] COMPLAINANT'S EXHIBIT No. 24

March 31, 1928.

Hon. M. C. Hinderlider, State Engineer, Denver, Colorado.

DEAR MR. HINDERLIDER:

This will acknowledge receipt of your letter dated March 26, 1928, subject "Laramie River Diversions," in which you kindly extend an invitation to me to meet with the representatives of the various interested ditch companies in your office at one o'clock on April 5, 1928. The purpose of the meeting, as expressed in your letter, being a desire on the part of representatives of interested ditch companies to discuss with me the matter of whether you will be permitted to cooperate, as State Engineer of Colorado, in the inventory of the quantity of water diverted from the Laramie River watershed to the Cache La Poudre watershed by trans-mountain diversions, and to jointly ascertain the legal quantity of water to which each trans-mountain diversion and appropriation is entitled.

Briefly my letter dated March 8, 1928, proposed an unofficial commission of yourself, Mr. Follansbee and the writer, under whose direction, and at the expense of Wyoming, the desired inventory would be carried out. In this my thoughts were that you would represent Colorado Laramie-Poudre water users, the writer the Wyoming water users, and Mr. Follansbee, District Engineer of the United States Geological Survey, Denver, Colorado, would perform the function as a third disinterested party.

My proposal was prompted by the desire to have an efficient and harmonious commission of three men, each of whom would confer from time to time with his constituents and represent them both in the field and in conference. For the purpose of economizing in time, I believe the proposed commission should function similar to the Interstate Streams Commissioners on the tri-state compact. Hon. Delph Carpenter, Interstate Streams Commissioner for Colorado, conducts all conferences with his home people. The writer, for Wyoming, does likewise with his people. Whenever reasons require, the Commissioners meet and try to reconcile and harmonize their constituents' ideas, thus economizing on the time of everyone.

It seems to me that the meeting on April 5th, in your office, is more in the nature of a local conference for the purpose of giving the representatives of the interested ditch companies, in order that they may arrive at a decision, an opportunity to discuss with you, as their representative, the proposal set forth in my letter to you of March 8, 1928. This conference will afford you the opportunity to ascertain their [fol. 1388] wishes and convey same to me.

The fact that the trans-mountain diversions are few in number, the water rights of which, I assume, have been clearly defined by the courts; and that the work of the commission will neither destroy the ditches or appurtenant structures nor obstruct the flow of water therein leads this office to believe that there will be no objections on the part of the Colorado appropriators to the organization of the commission as outlined, or to the carrying on of the inventory.

Permit me to express to you at this time my appreciation of your many gracious favors and the hope that you will, even though I am absent, call together in your office on April 5, 1928, the owners or representatives of the various interested ditch companies and conduct the conference as planned. The State Engineer's Office awaits your reply which we hope will be favorable.

Very truly yours, John A. Whiting, State Engineer.

JAW-MHG.

Dear Mr. Whiting:-

Replying to your letter of March 31st., I fear that I have not heretofor made myself clear in this matter.

The request presented to this office by the Colorado water users, was for the purpose of meeting with you and through such conference to more definitely ascertain your position in this regard, especially with respect to the method for carrying out the proposed investigation.

It is my understanding that the Colorado water users are not adverse to such an investigation, provided the method of carrying out the same eliminates any chance of duplicate observations and conclusions.

In view of the fact that it will be needful to enter upon private property to make such investigations, it will be necessary to secure the cooperation of such ditch interests, and I therefore believe such conference between you and these ditch interests needful, prior to arranging for this investigation.

I will accordingly await your further reply in this regard, hoping that you may find it convenient to come to Denver next Thursday for such conference. Unfortunately it will be necessary for me to be out of my office on Friday and Saturday and the forepart of the succeeding week.

Very truly yours,

M. C. Hinderlider

State Engineer.

MCH:bc

[fol. 1390] COMP. EXH. No. 26

April 3rd, 1928.

Mr. M. C. Hinderlider, State Engineer of Colorado, Denver, Colorado.

DEAR MR. HINDERLIDER:

Many thanks for the information contained in your letter of April 2nd, 1928, subject: "Laramie River Diversions."

In that letter you indicated that the conference is desired by the representatives of the various interested ditch companies on April 5th, 1928, to ascertain as stated in your letter:

"The request presented to this office by the Colorado water users, was for the purpose of meeting with you and through such conference to more definitely ascertain your position in this regard, especially with respect to the method for carrying out the proposed investigation."

In reply to this inquiry would say that I have not given the matter particular consideration, neither have I consulted with Mr. Follansbee, of Denver, and yourself, both proposed members of the Commission, as to the method of carrying out the proposed investigations. It had been considered by me as merely a detail to be determined by the Commission, if and when, Colorado had agreed to the water inventory under the terms proposed by this office. Personally, as one of the three Commissioners, it is my thought that the work of the Commission should be conducted independently and apart from any similar work carried on by other parties. It occurs to me that Mr. Follansbee, on behalf of and in cooperation with the Commission might install an automatic gage at a suitable place on each canal. Mr. Follansbee or a hydrographer under his supervision would establish and rate each station. Mr. Follansbee would likewise receive all rating records and gage charts and from same prepare two copies, one of which to be given you, the other to be forwarded to the office of the Wyoming State Engineer.

As to "duplicate observations and conclusions", I am sure that your people will dismiss this thought when you call their attention to the fact that two of the three Commissioners are long residents of Denver, Colorado, and are ably qualified by education and experience to safeguard their interest.

I have this day written to Mr. Follansbee, kindly request-

ing [illegible]ttend your conference on April 5th and explain to th. various representatives of the interested ditch companies present the methods he would presumably use in conducting a water inventory of the trans-mountain diversions.

[fol. 1391] With kindest regards, I am,

Very truly yours, John A. Whiting, State Engineer.

JAW:GEE.

[fol. 1392] COMP. EXH. No. 27

April 3, 1928.

Hon. Robert Follansbee, District Engineer, U. S. G. S., 403 New Post Office Bldg., Denver, Colorado.

DEAR MR. FOLLANSBEE:

Mr. M. C. Hinderliter, State Engineer of Colorado, has called a conference of the owners or representatives of the owners of the various interested ditches on the Cache La Poudre River, to meet in his office at the Colorado State Capitol on April 5th, 1928 at one o'clock P. M. Mr. Hinderliter has especially invited me to be present, stating that the various representatives desire to discuss with me the method of precedure and the possibility of "duplication of observations and conclusions."

As you well know, this is our busiest time of the year and I find it impossible to keep up my office work and the field work in Wyoming in connection with the duties of my office. My personal desire would be to attend this conference in Denver but for reasons above mentioned, I find it impossible to make the trip and at the same time I feel that the importance of my being present is greatly exaggerated. The matter of inventorying the flow of water in three or four canals is not in itself of major importance but is merely one of the instances occuring in both Mr. Hinderliter's and my offices. I would therefore respectfully request that yourself and Mr. Hinderliter, being two of the three members of the proposed commission, conduct the hearing in Denver on April 5th, as planned.

Trusting that this will be entirely satisfactory, I am,

Very truly yours, John A. Whiting, State Engineer.

JAW:BJ

Mr.John A.Whiting, State Engineer,
Cheyenne, Wyoming.

Dear Mr. Whiting:-

Following request by Mr. Meeker for certain hydrographic data relating to diversions from the Laramie River by Colorado ditches, the writer was called out of Denver for several days, which accounts for not having addressed you in this regard.

We would like to have a conference with you at your early convenience,for the purpose of discussing the matter of such diversions.

If you cannot find it convenient to come to Denver, I can arrange, upon short notice from you, to meet you in Cheyenne.

May we hear from you with regard to this matter,at an early date.

Very truly yours,

M C Hinderlider
State Engineer.

[fol. 1394] COMP. EXH. No. 29

Laramie River Conference, Cheyenne, May 20, 1929

Colorado and Wyoming Officials

Wyoming Requests:

1. Wyoming requests strict observance of the terms of the United States Supreme Court Decree of June-October, 1922, concerning the waters of the Laramie River, with limitations of trans-mountain diversions as therein ordered, viz:

(a) Skyline ditch to 18,000 acre feet per year.

(b) Laramie Poudre Tunnel to 15,500 acre feet per year.

(c) Deadman Feeder of Wilson Supply Ditch to the relatively small amount of water diverted from Deadman Creek.

2. Cessation of diversions from the Laramie River Basin by the Columbine, Bob Creek, and Laramie-Twin and Lost Lake ditches, which are not decreed intra- or inter-state.

3. Colorado State Engineer to mail weekly to Wyoming State Engineer, copies of weekly Water Commissioners' reports of trans-mountain diversions from the Laramie River to the Poudre River Basin. (Water Commissioner District 3 to Division Engineer.)

4. Opportunity by Wyoming State Engineer to examine from time to time automatic gage charts, meter measurements and related records of Colorado trans-mountain diversions from the Laramie River to the Poudre Basin. Check meter measurements of such diversions by Wyoming to be supplied the Colorado State Engineer.

5. Installation of rating flume and automatic gage on Deadman Feeder of Wilson Supply Ditch.

SUBJECT Laramie River Diversions

EXHIBIT NO. 30

Dear Mr. Whiting:-

We acknowledge receipt of your letter of April 3rd in reply to our letter of April 2nd concerning the above matter.

I regret exceedingly that you found it impossible to be here today to meet with representatives of the various Colorado ditches making diversions from the Laramie River. All ditches were represented and Mr. Follansbee was present at the meeting and entered into the discussions.

After full consideration of your requests concerning a cooperative investigation of these trans-mountain diversions, the feeling prevailed that it would be entirely agreeable to our Colorado people to have your office investigate the present measuring devices installed in the ditches in question, and to make any measurements of the flow therein, and have access to all automatic register charts at all reasonable times, and to also have access to a copy of the tabular statements of the quantities of water diverted, as determined from the measurements through such devices.

They of course are agreeable to placing in proper operating condition, any measuring device which may be found by this office to be necessary to the end that reliable records may be obtained.

They are opposed, however, to turning over to any unofficial agency, the right to make final determination of the quantities of water diverted

#2. J.A.Whiting

4/5/28

by their ditches, feeling that such plan would illegally relieve the State Engineer of obligations with which he is charged by law.

As a result of the rather full discussion at the meeting just adjourned, it appeared necessary to arrange for further conference between the representatives of the ditches in question, yourself and the writer, for further consideration of this matter.

I therefore trust that you may find it convenient to designate a time when you may meet with our people, when more extended consideration may be given the matter in question.

SUBJECT

EXHIBIT NO. 31

Hon. John A. Whiting,
State Engineer of Wyoming,
Cheyenne, Wyoming.

Dear Mr. Whiting:-

Immediately after our conference last week, I addressed letters to the owners of the principal trans-mountain diversions from the Laramie to the Poudre Rivers, reciting the nature and reason for your request for a cooperative investigation of such trans-mountain diversions, requesting that I be informed of their views in this regard, and incidentally advising them that I saw no particular objection to the granting of your request and that if such investigation were made it would be well to have it of a cooperative nature.

Immediately upon reply to my letters I will advise you promptly of their reaction and the final decision of this office in this regard.

With kind personal regards, I am

Very truly yours,

M. C. Hinderlider

State Engineer.

MCH/bc

[fol. 1398] COMP. EXHIBIT No. 32

June 21st, 1930.

The Honorable William H. Adams, Governor of Colorado, Denver, Colorado.
Honorable M. C. Hinderlider, State Engineer of Colorado, Denver, Colorado.
Honorable Robert E. Winbourn, Attorney General of Colorado, Denver, Colorado.
Honorable Delph E. Carpenter, Commissioner for Colorado, Greeley, Colorado.

GENTLEMEN:

I

The Supreme Court of the United States in determining the relative rights of the States of Wyoming and Colorado to appropriate and apply to beneficial use the water of the Laramie River and its tributaries, after reviewing the evidence submitted in the case as presented, and having considered the findings of the Commissioners to whom the matter was referred, found: (260 U. S., page 1).

1. That the State of Colorado had an established right to divert by means of the Skyline Ditch from the Laramie River and its tributaries, eighteen thousand (18,000) acre feet of water per annum.

2. That rights recognized by the State of Colorado authorizing the diversion and use from the Laramie River and its tributaries, of four thousand two hundred and fifty (4,250) acre feet of water per annum, for the irrigation of that number of acres of native hay meadows in the Laramie [fol. 1399] Valley in Colorado, referred to as the meadow land appropriations, should not be prejudiced.

3. That after recognizing the above appropriations aggregating twenty-two thousand two hundred and fifty (22,250) acre feet of water per annum, there was remaining available water in said stream and its tributaries subject to appropriation and use in the amount of two hundred eighty-eight thousand (288,000) acre feet annually; that of this amount two hundred seventy-two thousand five hundred (272,500) acre feet per annum was required to satisfy senior appropriations in Wyoming, leaving available for diversion annually for the so-called Laramie-Poudre Tun-

nel appropriation the amount of fifteen thousand five hundred (15,500) acre feet of water, and on these findings entered its decree dated June 5th, 1922, and which as subsequently modified and entered October 9th, 1922, was in substance as follows:

a. That the State of Colorado and the defendant corporations, their officers, agents and servants were enjoined from diverting or taking from the Laramie River and its tributaries in the State of Colorado more than fifteen thousand five hundred (15,500) acre feet of water per annum in virtue of or through the Laramie-Poudre Tunnel appropriation in the State of Colorado;

b. That the right of the State of Colorado or any one then recognized by her as duly entitled thereto to divert and take from said stream and its tributaries within the State of Colorado eighteen thousand (18,000) acre feet of water per annum through the Skyline Ditch should not be prejudiced;

c. That the right of the State of Colorado or any one then recognized by her as duly entitled thereto to continue [fol. 1400] to exercise the right then existing and recognized, to divert and take from the Laramie River and its tributaries in the State of Colorado four thousand two hundred and fifty (4,250) acre feet of water per annum through the meadow land appropriations, should not be prejudiced;

d. That the right of the State of Colorado or of any one then recognized as duly entitled thereto, to continue to exercise the right then existing, and recognized in said Decree, to divert and take from the head-waters of Deadman Creek, a Colorado tributary of the Laramie River, the relatively small amount of water appropriated therefrom prior to the year 1902, by and through what is designated as the Wilson Supply Ditch, should not be prejudiced;

e. That the right of the State of Colorado or the State of Wyoming or of any one then recognized by either State as duly entitled thereto, to continue to exercise the right to divert and use water from Sand Creek, in virtue of any then existing and lawful appropriation of waters of such creek, should not be prejudiced.

II

Examinations of the water shed of the Laramie River and its tributaries show that new diversion ditches have been constructed and that ditches existing at the time of the submission of the above case to the United States Supreme Court, have been reconstructed and/or enlarged, and that such new and/or enlarged and reconstructed ditches have been and are being used in furtherance of excessive and unlawful diversions of water from the Laramie River and/or its tributaries.

[fol. 1401]

III

Such examinations of the water shed of the Laramie River and its tributaries further show that new reservoirs have been constructed, and that reservoirs, existing at the time of the submission of the above case to the United States Supreme Court, have been enlarged, and that such new and/or enlarged reservoirs have been and are being used in furtherance of such excessive and unlawful diversions of water from the Laramie River and/or its tributaries.

IV

The official records of the State of Colorado for the year 1929 and prior years show that diversions of water from the Laramie River and/or its tributaries for use in the State of Colorado by users of water in Colorado have not been confined to the limitations set forth in said Decree.

V

The State of Wyoming hereby respectfully calls your attention to the said excessive and unlawful diversions of water, including among others the following diversions: Link Ditch, Skyline Ditch, Laramie-Poudre Tunnel (including collection ditches), Bob Creek Ditch, Columbine Ditch, Wilson Supply Ditch, the Sand Creek Ditch and also the waters diverted and stored in Chambers Lake, Lost Lake, Laramie Lake, Twin Lake, Lily Lake and other reservoirs, all the waters of which so excessively and unlawfully diverted, are discharged into the Poudre River in violation of the terms of said Decree.

VI

The usual shortage of water from the water shed of the Laramie River and its tributaries during the present irrigating season, requires that excessive and illegal diversions of water as above referred to, be brought to the attention [fol. 1402] of the officials of the State of Colorado that said State may prohibit said excessive and illegal diversions of water.

VII

Said continued excessive and illegal diversion of water by and within the State of Colorado, results in depriving the lawful appropriators by and within the State of Wyoming of the use of the waters to which they are entitled, under the terms of said Decree.

Wherefore, the State of Wyoming respectfully requests that the diversions of water from the Laramie River and/or its tributaries by and within the State of Colorado be confined to the limitations as established by said Decree; that such excessive diversions be immediately discontinued; and all illegal diversions be prohibited; to enable the State of Wyoming to obtain and use the full amount of water per annum as allotted to her under the terms of said Decree.

In testimony whereof we have hereunto set our hands at Cheyenne, Wyoming, this twenty-first day of June, A. D. 1930.

—— ——, Governor of Wyoming; —— ——, State Engineer of Wyoming and Interstate Streams Commissioner; —— ——, Attorney General of Wyoming.

RECEIVED AUG 15 1930 GOVERNOR'S OFFICE

Gentlemen:

The attached letter in response to your letter of June 21, 1930, was signed by Attorney General Robert E. Winbourn who departed this life on the 7th inst., and before the letter was ready for transmittal to you. I approve the letter, however, as his successor in office.

Permit me to add that the delay in answering your favor of June 21 was occasioned, in large part, by the recent illness and death of Mr. Winbourn.

Respectfully yours,

JOHN S. UNDERWOOD,
Attorney General,

Hon. John A. Whiting
State Engineer of Wyoming and
Interstate Streams Commissioner
Cheyenne, Wyoming

Hon. William O. Wilson
Attorney General of Wyoming
Cheyenne, Wyoming

Gentlemen:

We beg to reply further to your letter of June 21, 1930, which contains a synopsis of the decree of the Supreme Court of the United States in the case of State of Wyoming v. State of Colorado, et al., reported in 260 U. S. Rep. 1, alleging that diversions of water from the Laramie River in Colorado have been made by certain named ditches in violation of the terms of that decree and requesting a discontinuance of all illegal diversions.

We have considered carefully the complaints made by you and have checked all Colorado records of diversions of water out of the Laramie River in the State of Colorado and have been unable to find that Colorado or her citizens have violated the decree by diversions through the tunnel in excess of the amount

allowed, or by aggregate annual diversions by Colorado users in excess of the total amount mentioned in the decree).

Please be assured that we at all times are willing and anxious to abide by the terms of said decree in every particular, and if there has been any violation it has been wholly unintentional on the part of Colorado officials. If there are records of illegal diversions of water from the Laramie River in Colorado which have not been brought to our attention and you care to submit them to us, we shall be pleased to check them over in detail and, if found to be a violation of the decree, we will gladly cause a discontinuance of the same; or if you care to confer personally with us and point out wherein the decree has been violated, it will give us pleasure to join you in such a conference.

It is our earnest desire to work in harmony with the people of Wyoming to the end that any and all matters of difference along the lines suggested may be adjusted to our mutual satisfaction.

Respectfully yours,

Governor of Colorado

State Engineer of Colorado

Attorney General of Colorado

Commissioner for Colorado.

[fols. 1413-1629] COMP. EXH. #41

Skyline Ditch Diversions—June, 1926

From the Laramie River to the Poudre River

Compiled from Weekly Reports of Water Commissioner Water District #3 (Poudre River) to Division Engineer at Denver, and computed from Automatic Gage Height Charts of Skyline Ditch on file in State Engineer's Office, Denver, Colorado, Apr. 5, 1933

R. I. Meeker, Irrigation Engineer

Average Weekly Diversions in Second Feet

	As reported by Water Com'r District No. 3		As computed from automatic gage height charts by Meeker	
Week of 1926	Quantity	No. of days	Quantity	No. of days
June 6-12	136 s.f.	5	142 sec. ft.	7
June 13-19	155 s.f.	2	99 sec. ft.	7
June 20-26	111 s.f.	4	111 sec. ft.	7

Transposing the above values into acre feet gives the following table:

Average Weekly Diversions in Acre Feet

Week of 1926	As reported by Water Com'r Dist. No..3	As computed from automatic gage charts by Meeker
June 6-12	1360 acre feet	1988 acre feet
June 13-19	620 acre feet	1386 acre feet
June 20-26	888 acre feet	1127 acre feet
Totals	2868 acre feet	4501 acre feet
		2868 acre feet
Unreported water		1633 acre feet but recorded on charts.

Colorado Official rating table of Skyline Ditch applied to automatic chart gage heights by R. I. Meeker.

[fol. 1630] COMP. EXHIBIT 42

Laramie River Near Jelm, Wyo.

Location.—In sec. 15, T. 12 N., R. 77 W., at highway bridge at Boswell's ranch, a quarter of a mile below Colorado-Wyoming line, 4 miles south of Jelm, Albany County.

Drainage Area.—297 square miles (measured on topographic map).

Records Available.—May 7, 1911, to September 30, 1921. From June 22, 1904, to October 31, 1905, a station was maintained at Decker's ranch, half a mile south of the State line. The records at the two stations are practically comparable, as there are no tributaries nor diversions of any account between.

[fol. 1631] Gage.—Bristol water-stage recorder at downstream side of right bridge abutment used since 1911. Vertical staff during 1904-5.

Extremes of Discharge.—1904-5, 1911-1921: Maximum stage recorded, 4.2 feet at noon June 8, 1920, from high-water mark (discharge, 3,840 second-feet); minimum stage recorded, 1.8 feet on September 22-24, October 4-8, 18-23, 28-31, 1905 (discharge, 22 second-feet).

Diversions.—Between Glendevey and Jelm stations court decrees for diversion of 292 second-feet from Laramie River and 329 second-feet from intervening tributaries.

Cooperation.—Station maintained in cooperation with State engineer of Colorado.

Accuracy.—Gage read twice daily during 1904-5. Since 1911 gage heights obtained from continuous record. Rating curves well defined. Records good except during winter, for which they are fair.

Note.—Winter records estimated. Records for 1912 revised.

Laramie River At Woods Landing, Wyo.

Location.—In sec. 11, T. 13 N., R. 77W., at highway bridge at Woods Landing, a short distance below mouth of Wood Creek, nearest tributary.

Drainage Area.—Not measured.

Records Available.—July 1, 1890, to June 30, 1892; April 12, 1896, to September 30, 1900; May 7 to November 11, 1911.

Gage.—Vertical staff; no determined relation between gage used during 1911 and those used prior to 1900.

[fol. 1634] Diversions.—Practically no water is diverted between station near Jelm and Woods Landing.

Extremes of Discharge.—1890-1892; 1896-1900; 1911: Maximum stage recorded, 4.65 feet on June 25, 1899 (discharge, 4,500 second-feet); minimum stage recorded, 1.0 foot on September 23, 1911 (discharge, 17 second-feet).

Accuracy.—No statement of accuracy, as conditions under which station was maintained are not known. Records fair for 1911.

Note.—Winter records revised.

Laramie River and Pioneer Canal Near Woods, Wyo.

Location.—In sec. 36, T. 14 N., R. 77 W., at diversion dam for Pioneer canal, 2 miles above Woods post office, in Albany County. Nearest important tributary, Fox Creek, enters 3 miles above.

Drainage Area.—409 square miles (measured on base maps of Wyoming and Colorado; scale, 1:500,000).

Records Available.—May 1, 1912, to September 30, 1921.

Gage.—Bristol water-stage recorder whose datum is the crest of the dam. Gage originally at left end of dam just below Pioneer canal headgates. On September 23, 1915, gage was moved to upper wing wall of headgates, and although it is actually above the canal intake it still indicates the amount passing the dam, as it is in the pool formed by diversion dam. Chain gage in Pioneer canal is at Johnson Bridge, 1½ miles below intake. It is read by an employee of the Laramie Water Co.

Extremes of Discharge.—1912-1921: Maximum stage recorded, 4.4 feet from 8 a. m. to noon June 23, 1917 (river discharge, 3,310 second-feet, combined discharge, 3,820 second-feet); minimum flow probably occurs during winter

[fol. 1636] Diversions.—By decree of district court dated December 27, 1912, there were adjudicated diversions of approximately 10 second-feet from Laramie River be-

tween the State line and Pioneer dam, exclusive of the Pioneer canal, which has decrees for 282 second-feet. Enlargement of Pioneer canal has storage rights for 68,500 acre-feet in Lake Hattie.

Accuracy.—(River) Gage heights from continuous records except as noted. Rating curve well defined below 1,200 second-feet. Records good except during winter, for which they are fair. (Canal) Gage probably read twice daily during 1912-13; May 21 to June 30, 1916; during 1917; and once daily for remainder of period. Records fair.

[fol. 1648] Little Laramie River Near Filmore, Wyo.

(Known as Little Laramie River near Hatton in 1902-3.)

Location.—In sec. 9, T. 15 N., R. 77 W., at private bridge at May's ranch, 1½ miles south of Filmore, Albany County. No important tributary between station and junction of North, Middle, and South forks, 4 miles above.

[fol. 1649] Drainage Area.—155 square miles (measured on base map of Wyoming; scale 1:500,00).

Records Available.—July 5, 1902, to September 30, 1903; May 14, 1911, to September 30, 1921. State engineer maintained station during 1913 and 1914.

Gage.—Vertical staff at downstream end of left bridge abutment. Gage used since April 1, 1915, was referred to datum 0.21 foot lower than gage at same location used during 1911 and 1912.

Extremes of Discharge.—1902, 1903; 1911-1921. Maximum stage recorded, 5.9 feet at 7 a. m. June 1, 1914 (discharge, 2,400 second-feet); minimum stage recorded, 0.25 foot September 19-20, 1913 (discharge, 1 second-foot).

Diversions.—Prior to July 1, 1921, adjudicated diversions of 43 second-feet from the Little Laramie above station and 254 second-feet from tributaries entering above.

Accuracy.—Gage read twice daily. Rating curve well defined except for periods of shifting control. Records good except from 1917 to 1920, for which they are considered excellent, and during winter for which they are fair.

[fol. 1869] COMP. EXHIBIT 43

Laramie River Near Jelm

Location.—In sec. 15, T. 12 N., R. 77 W., just below highway bridge at Boswell's ranch, a quarter of a mile below Colorado-Wyoming line, 4 miles south of old Jelm, Albany County. Stuck Creek enters 1 mile upstream.

Drainage area.—297 square miles.

Records available.—May 7, 1911 to September 30, 1922. From June 22, 1904, to October 31, 1905, station maintained at Decker's ranch, half a mile south of state line.

Gage.—Friez water-stage recorder moved September 4, 1921 from middle pier of bridge to right bank 30 feet downstream from bridge; inspected by Mrs. C. D. Oviatt.

Diversions.—Court decrees for diversion of 292 second-feet from Laramie River between Glendevey and Jelm stations.

Accuracy.—Gage heights from continuous record except as explained in foot note to daily discharge table; rating curves well defined, applied indirectly for shifting control June 4 to July 9, 1921. Records good except during high water in 1921, for which they are fair.

30	44	115	910	236	89	53	34
31	44	....	679	....	78	50	....

Note—No gage height record October 24-31, 1920; June 12-14, 16-17, July 10-15, October 17-31, 1921; September 3-17, 1922; discharge based on records of Glendevey and Woods stations.

[fol. 1871] Laramie River and Pioneer Canal Near Woods

Location.—In sec. 36, T. 14 N., R. 77 W., at diversion dam for Pioneer Canal, two miles above Woods postoffice, Albany County. Nearest important tributary, Fox Creek, enters three miles above.

Drainage area.—409 square miles.

Records available.—April 16, 1912, to September 30, 1922. From 1895 to 1900, and from May 7 to November 11, 1911, a station was maintained at Woods Landing in sec. 11, T. 13 N., R. 77 W. The records are not directly comparable as Fox Creek enters between and a few small ditches divert water.

Gage.—Bristol float-type water-stage recorder whose datum is the crest of the dam. Gage originally located at left end of dam just below Pioneer Canal headgates. On September 23, 1915, gage was moved to upper wing wall of headgates, and although it is actually above the canal intake it still indicates the amount passing the dam as it is in the pool formed by diversion dam. Chain gage in Pioneer Canal is located at the Johnson bridge 1½ miles below intake. It is read by an employee of the Laramie Water Company.

Diversions.—By decree of district court dated December 27, 1912, there were adjudicated diversions of approximately 10 second-feet from Laramie River between the State line and Pioneer dam, exclusive of the Pioneer Canal, which has rights for 282 second-feet.

Regulation.—None, as pond above dam is too small to have any appreciable effect on flow. Whenever canal headgates are closed the discharge over dam increases.

Accuracy.—River: Gage heights from continuous record; rating curves well defined. Records excellent. Canal: Gage read once a week; rating curves well defined. Records roughly approximate.

[fol. 1880] Little Laramie River Near Filmore

Location.—In sec. 9, T. 15 N., R. 77 W., at private bridge at May's ranch, 1½ miles south of Filmore, Albany County. No tributary of importance between station and junction of North, Middle and South forks, 4 miles above.

Drainage area.—155 square miles.

Records available.—May 14, 1911, to October 31, 1912; April 1, 1915, to September 30, 1922. State engineer maintained station at this point during 1913 and 1914.

Gage.—Vertical staff at downstream end of left bridge abutment; read by Claude May. Gage used since April 1, 1915, referred to datum 0.21 foot lower than gage at same location used during 1911 and 1912.

Diversions.—Prior to July 1, 1921, there were adjudicated diversions of 43 second-feet from the Little Laramie above station and 254 second-feet from tributaries entering above.

Accuracy.—Gage read twice daily; rating curve well defined. Records good.

[fol. 2036] COMP. EXHIBIT 44

Laramie River Near Jelm

Location.—In Sec. 15, T. 12 N., R. 77 W., just below highway bridge at Boswell's ranch, a quarter of a mile below Colorado-Wyoming line, 4 miles south of old Jelm, Albany County. Stuck Creek enters 1 mile upstream.

Drainage area.—297 square miles.

Records available.—May 7, 1911 to September 30, 1924. From June 22, 1904 to October 31, 1905, station maintained at Decker's ranch half a mile south of state line.

Gage.—Bristol float-type water-stage recorded on right bank 30 feet downstream from bridge; inspected by Mrs. C. D. Oviatt.

Diversions.—Water diverted for irrigation of 3,000 acres between Glendevey and Jelm stations.

Accuracy.—Gage-heights from continuous record except as explained in foot note to daily discharge table; rating curves well defined. Records fair for 1923 and good for 1924.

Monthly Discharge of Laramie River Near Jelm, for the Years Ending September 30, 1923 and 1924

Month	Discharge in second-feet			Run-off in acre-feet
	Maximum	Minimum	Mean

31	81	....	....	....	....	....	....	584	....	96	42	69

Note.—No gage-height record October 1-6, 20, 21, 29-31, 1922, May 6 to June 7, June 11-30, July 10-13, August 12-21, 27-31, September 1-18, 23-25, November 16-22, 1923, July 18-20, 29-31, August 1-3, 28-31, 1924; discharge based on comparison with records of Laramie River near Woods except for November, 1923, for which period they were estimated.

[fol. 2038] Laramie River and Pioneer Canal Near Woods

Location.—In Sec. 36, T. 14 N., R. 77 W., at diversion dam for Pioneer Canal, two miles from Woods postoffice, Albany County. Nearest important tributary, Fox Creek, enters three miles above.

Drainage area.—409 square miles.

Records available.—April 16, 1912, to September 30, 1924. From 1890 to 1900, and from May 7 to November 11, 1911, a station was maintained at Woods Landing in Sec. 11, T. 13 N., R. 77 W. The records are not directly comparable, as Fox Creek enters between and a few small ditches divert water.

Gage.—Bristol float-type water-stage recorder whose datum is the crest of the dam. Bristol water-stage recorder in Pioneer Canal is located at the Johnson bridge 1½ miles

below intake; read by an employee of the Laramie Water Company.

Diversions.—Water diverted for irrigation of 700 acres from Laramie River between Jelm and Woods stations, exclusive of diversion by Pioneer Canal.

Accuracy.—River; gage heights from continuous record; rating curve well developed. Records excellent. Canal: Gage heights from continuous record; rating curves well defined except for short periods when control shifted slightly. Records good.

[fol. 2047] Little Laramie River Near Filmore

Location.—In Sec. 9, T. 15 N., R. 77 W., at private bridge at May's ranch, 1½ miles south of Filmore, Albany County. No tributary of importance between station and junction of North, Middle and South forks, 4 miles above.

Drainage area.—155 square miles.

Records available.—July 5, 1902, to August 15, 1903; May 14, 1911, to October 31, 1912; April 1, 1915, to September 30, 1924. State engineer maintained station at this point during 1913 and 1914.

Gage.—Vertical staff at downstream end of left bridge abutment; read by Claude May. Gage used since April 1, 1915, referred to datum 0.21 foot lower than gage at same location used during 1911 and 1912.

Diversions.—Adjudicated diversions for irrigation of 2,000 acres from Little Laramie River and tributaries above station.

Accuracy.—Gage read twice daily; rating curves fairly well defined. Records good.

[fol. 2153]

Comp. Exhibit 45

Laramie River Near Jelm

Location.—In sec. 15, T. 12 N., R. 77 W., just below highway bridge at Boswell's ranch, a quarter of a mile below Colorado-Wyoming line, 4 miles south of old Jelm, Albany County. Stuck Creek enters 1 mile upstream.

Drainage area.—297 square miles.

Records available.—May 7, 1911, to September 30, 1926. From June 22, 1904, to October 31, 1905, station maintained at Decker's ranch half a mile south of state line.

Gage.—Bristol float-type water-stage recorder on right bank 30 feet downstream from bridge; inspected by R. A. Mosier.

Accuracy.—Gage heights from continuous record except as explained in footnote to daily-discharge table; rating curves well defined. Records excellent except for periods of missing gage heights for which they are fair.

Note.—No gage-height record May 1-2, 9, September 20-30, 1925; discharge based on comparison with flow of Little Loramie River at Two Rivers. Discharge for September 25, 1925 represents mean value for period.

[fol. 2249]

Comp. Exhibit 46

Laramie River Near Jelm

Location.—In sec. 15, T. 12 N., R. 77 W., just below highway bridge at Boswell's ranch, a quarter of a mile below the Colorado-Wyoming line, 4 miles south of old Jelm, Albany County. Stuck Creek enters 1 mile upstream.

Drainage Area.—297 square miles.

Records Available.—May 7, 1911, to September 30, 1928. From June 22, 1904, to October 31, 1905, station maintained at Decker's ranch half a mile south of state line.

Gage.—Bristol float-type water-stage recorder on right bank 30 feet downstream from bridge; inspected by R. A. Mosier.

Accuracy.—Gage heights from continuous records. Rating curves well defined. Records good.

[fol. 2478]

Comp. Exhibit 48

Laramie River Near Jelm

Location—In sec. 15, T. 12 N., R. 77 W., at Boswell's ranch, a quarter of a mile below the Colorado-Wyoming line, 4 miles south of old Jelm.

Drainage Area—297 square miles.

Records Available—May 7, 1911, to September 30, 1932. From June 22, 1904, to October 31, 1905, station maintained at Decker's ranch half a mile south of state line.

Gage—Au fuzee water-stage recorder on right bank 30 feet downstream from bridge; inspected by R. W. Mosier.

Accuracy—Records excellent except during winter period, for which they are fair.

Monthly Discharge of Laramie River Near Jelm for the Years Ending September 30, 1931 and 1932

Water Supply Laramie River Basin

Compiled and Deduced from Published Records of the U. S. Geological Survey, Biennial Reports of the State of Colorado and Biennial Reports of the State of Wyoming

R. I. Mecker, Irrigation Engineer April, 1933, Cheyenne

Average yearly flow	Long time means Acre Feet
Laramie River near Jelm, Wyoming, Colorado-Wyoming line interstate station, 23 year mean, 1905, 1911 to 1932 ..... Modern records with automatic gages.	135,000
Laramie River near Woods, Wyoming, at head of irrigated area on Laramie Plains, 23 year mean, 1905, 1911 to 1932	158,000 (a)
Little Laramie River near Filmore, Wyoming, at head of irrigated area on Laramie, Plains, 23 year mean, 1903, 1911 to 1932	84,000 (b)

(a) 1925 to 1931 records deduced from relation of flow at Jelm and Woods.

(b) 1926 to 1932 records deduced from relation of flow at Jelm and Filmore.

Average yearly flow	10-Year means 1923-32 Acre Feet
Laramie River near Jelm, Wyoming, Colorado-Wyoming interstate station	127,000
Laramie River near Woods, Wyoming	150,000
Little Laramie at Filmore, Wyoming	82,000

[fol. 2506] COMP. EXH. No. 55

Comparative Table

Water Supply Laramie River Basin

Modern Records Secured with Automatic Gages—Values in Acre Feet

Prepared from Exhibits

R. I. Meeker, April, 1933

Long Time Means	Nelson, 22 years	Meeker, 23 years
Laramie River at Colorado-Wyoming Line	135,560	135,000
Laramie River near Woods, Wyoming	158,240	158,000
Little Laramie River near Filmore, Wyoming	82,300	84,000

(Here follows photolithograph of cover page of Comp. Exhibit 55, side folio 2507)

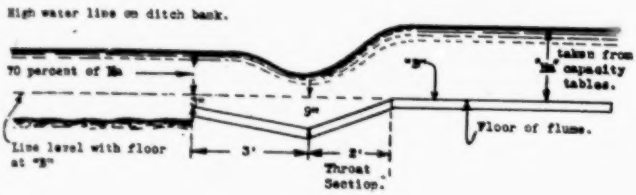
DIRECTIONS FOR PLACING VENTURI FLUME



First—Select from Table of flume capacities, the proper depth of water or head "Ha" that corresponds with the maximum capacity of the ditch, so that "Ha" will ordinarily not exceed one-half of the width of throat "W" which may be adopted.

Second—Locate the **high water line** on the ditch bank where the flume is to be installed, as shown by previous flows.

Third—Place the surface of the floor "B" at a depth of 70 per cent of "Ha," below the high water line.

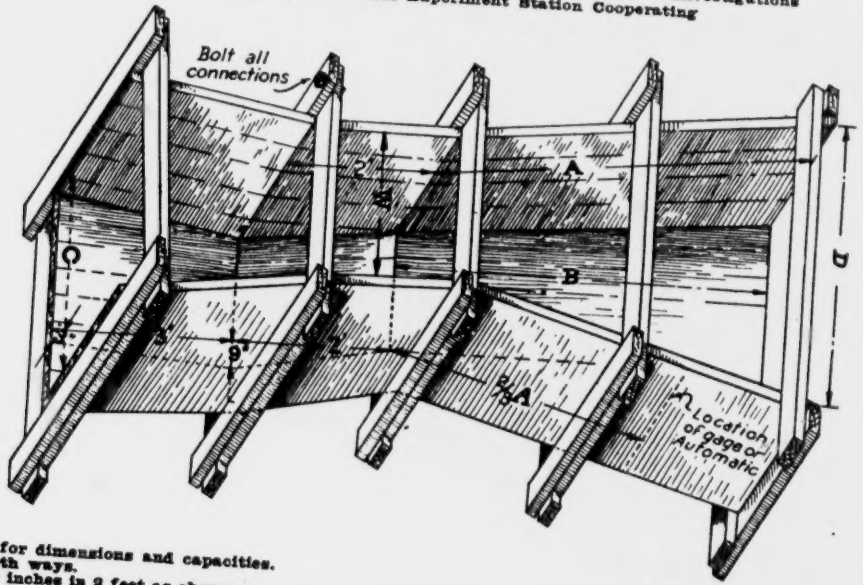
Fourth—Place the floor "B" level both length and crosswise and construct all flume bottoms with the drop and rise and of the lengths as shown by above sketch.

Fifth—Place gage on side of flume at a distance upstream from the throat, equal to two-thirds the distance "A."

Sixth—Provide cut-off wall, and wings at **each** end of flume at 45 degree angles, to prevent water cutting under or around same.

VENTURI FLUME

As Developed by U. S. Department of Agriculture—Irrigation Investigations
Colorado Agricultural Experiment Station Cooperating



Note—Refer to Table for dimensions and capacities.
Make Floor B level both ways.
Slope Floor of throat 9 inches in 2 feet as shown.
Raise lower end of Floor 6 inches in 3 feet as shown,
leaving lower end 3 inches lower than upper end of flume.

	Sept. 22	Whitten	0.67	11.76	12.68	+0.92	+ 7.8

* Staff gage.

The above table has been prepared to show the disagreement in diversion quantities from Laramie River as measured by current meter and as registered by automatic gage charts using Venturi tables to determine discharge. The Venturi records are at wide variance with the current meter discharges due to conditions at flume.

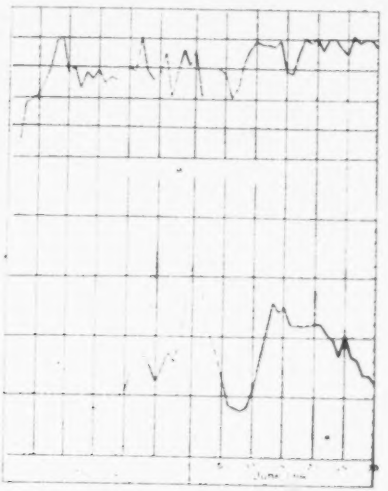
sequently the subsequent increase in temperature caused an immediate increase in discharge. Had the drop in temperature occurred after the snow had melted, there would have been no subsequent increase in discharge.

Relation between total snowfall and maximum run-off.—As the discharge of the mountain streams is mainly dependent upon the mountain snow, the water equivalent of the snow that accumulates [illegible] drainage basin determines the total run-off of the following [illegible] the snow falls early in the winter, it becomes compact and



[illegible] Gunnison River below Ohuray, Colo., showing relation [illegible] temperature and daily discharge.

melts slowly in the spring, causing the high-water period to be prolonged, but the water does not reach so high a maximum stage. On the other hand, if the snow falls late in the season it is loose and melts more readily, producing a short high-water period with a high maximum discharge. The maximum discharge depends not only upon the amount of mountain snow but also upon the rapidity with which the temperature rises in the spring. Figures 11 and 12 show the high-water hydrographs for two Colorado mountain streams for 1917 and 1918, together with the maximum daily temperatures for the

two years. In 1918 the temperature was high during the later part of May and increased rapidly during the first half of June. This caused the streams to rise rapidly to a high maximum and then recede rapidly, as the snow was soon melted. In contrast to this, in 1917 the temperature was low during the later part of May and increased but slowly during June; moreover, there were sudden drops in temperature during that period. As a result the discharge

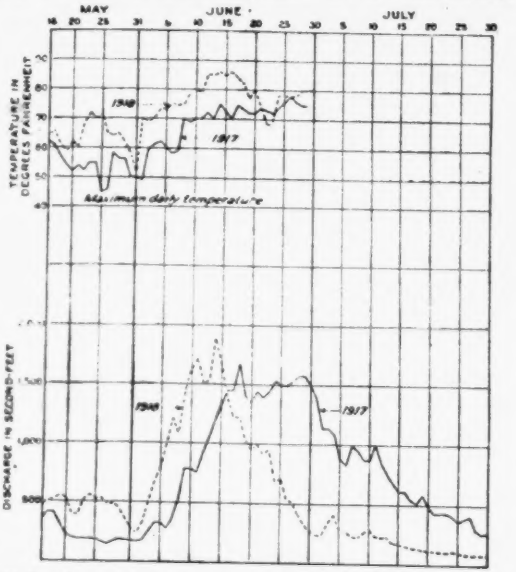


FIGURE 11.—High-water hydrographs for Uncompahgre River below Ohuray, Colo., showing relation between temperature and maximum discharge.

increased more slowly and receded more slowly, giving a longer high-water period but one that reached a lower maximum.

Diurnal fluctuations.—At the high altitudes of the Rocky Mountains, which range from 8,000 to 14,000 feet, the temperature during the 24-hour period fluctuates 20° to 30° or more, and during the spring this fluctuation causes the snow to melt during the warmer part of the day but to remain frozen the remainder of the time. This in turn causes a diurnal variation in the amount of water entering

2579-2581

the streams. Figures 13, 14, and 15 show the change in discharge during each 24-hour period for a week or more during high water for three typical streams. The discharge was determined from continuous gage-height graphs obtained by means of water-stage recorders. It will be seen that the hours of maximum and minimum discharge are not the same for each stream, as they depend upon the distance the melted snow has to travel before reaching the gage. For the Roaring Fork at Glenwood Springs fig. 13) the maximum and minimum daily temperatures are given.[2] It should be noted that the period covered by this graph includes the maximum discharge and

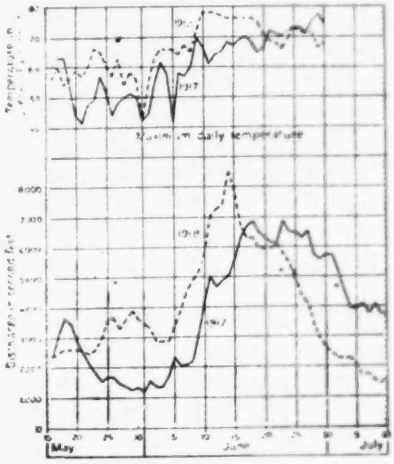

FIGURE 13.—Hydrographs for Colorado River at Hot Sulphur Springs, Colo., showing relation between temperature and maximum discharge.

that after June 14 the discharge decreased, although the temperatures continued high, a relation which shows that the snow had nearly disappeared.

The diurnal fluctuations are directly dependent upon the daily range of temperature up to the period of maximum discharge and also upon the increase in both maximum and minimum temperatures. Figure 16 shows the continuous discharge of Roaring Fork at Glenwood Springs from May 18 to June 10, 1919, together with the curve of maximum and minimum temperatures. From May 18 to 29 the extremes of temperature and their relation to each other remained

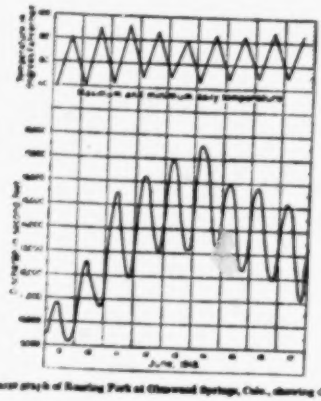

FIGURE 15.—Discharge graph of Roaring Fork at Glenwood Springs, Colo., showing diurnal fluctuations.

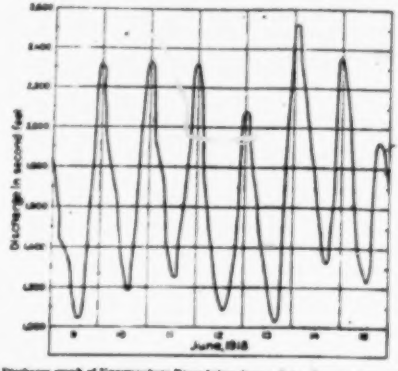

FIGURE 14.—Discharge graph of Uncompahgre River below Ouray, Colo., showing diurnal fluctuations.

2582

fairly constant, and as a result the diurnal fluctuations were somewhat uniform, although the mean discharge gradually increased. On May 30 the temperature suddenly dropped, and this resulted in an immediate decrease in the mean daily discharge and an almost complete elimination of diurnal fluctuations. Subsequently an increase in both mean and extreme temperatures caused a gradual increase in the mean daily discharge and a reappearance of the diurnal fluctuations, which increased in range as the temperature increased.

The range of fluctuation in percentage of mean discharge decreases as the distance of the point of measurement from the source increases,

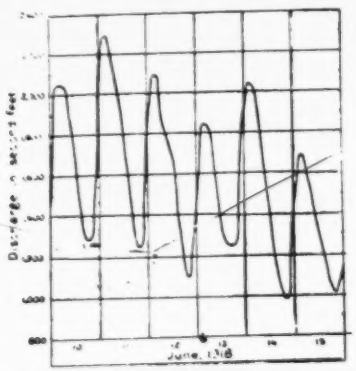

FIGURE 15.—Discharge graph of Tenmile Creek near Tenmile, Wash., showing diurnal fluctuations.

or, to express it in another way, as the drainage area above the point of measurement increases. This is due to the fact that water from melting snow in different portions of the drainage basin reaches the stream at different hours, thus tending to reduce the fluctuations. The larger the drainage basin the greater are the number of tributaries that bring their maximum discharges to the main streams at different hours and the greater the consequent equalizing effect. The accompanying table (p. 64) shows the percentage of variations in daily discharge of streams draining different-sized areas for simultaneous periods in 1918 and 1919.

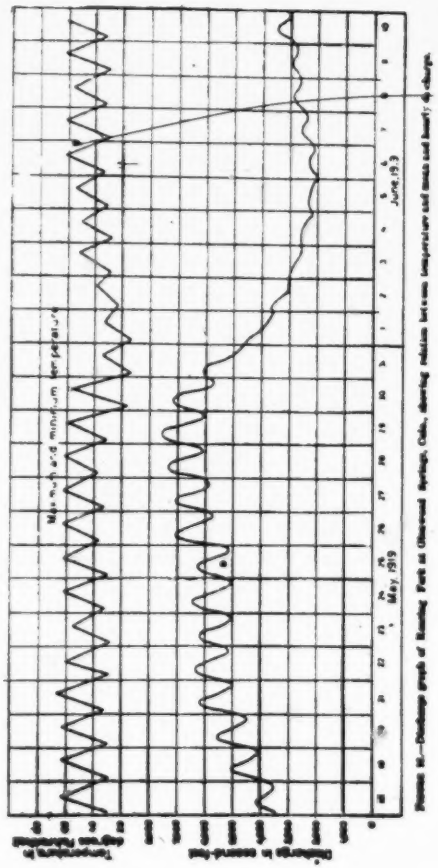

FIGURE 16.—Discharge graph of Roaring Fork at Glenwood Springs, Colo., showing relation between temperature and mean and hourly discharge.

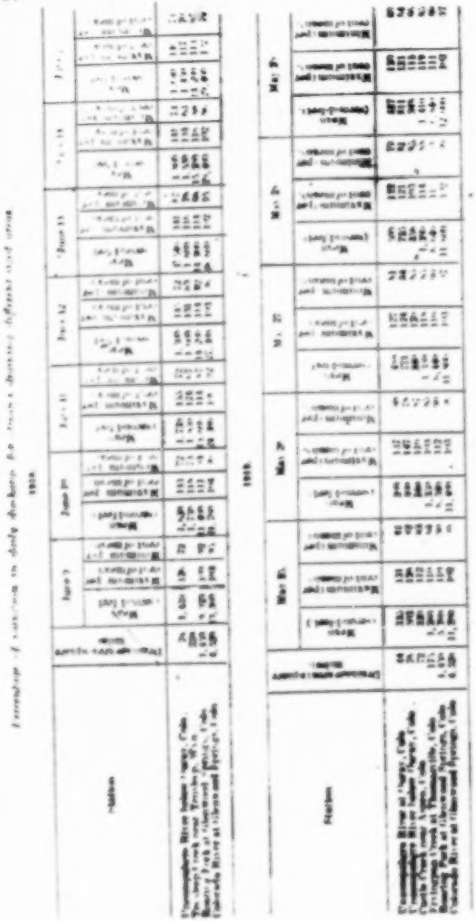
2583



The drainage areas above the measuring points on the streams shown for the seven days in 1918 range from 76 to 1,530 square miles. The average maximum discharge ranged from 139 per cent of the mean for the smallest area to 103 per cent for the largest, and the average minimum discharge from 72 to 95 per cent. The drainage areas considered in the comparison for the five days in 1919 range from 44 to 4,720 square miles. The average maximum discharge ranged from 127 to 102 per cent of the mean for the smallest and largest areas, respectively, and the average minimum discharge ranged from 80 to 97 per cent. The range of percentages was smaller in 1919 on account of the smaller total discharge and the colder spring. The tabulation also shows the possible errors that may be made by basing computations of daily discharge upon one gage reading. The mean of two daily readings taken nearly 12 hours apart will be very much nearer the true mean for the day, as will be seen by inspecting figures 13 to 16.

UNIT RUN-OFF.

Stations in the same basin.—As snowfall, which is the chief source of run-off in the mountain streams, increases with altitude, it is evident that in general the upper portions of a drainage basin have a greater run-off per unit of area drained than the lower portions. It is not possible to show directly the varying run-off from different altitudes, but a comparison of the records for different stations on the same stream shows that the smallest unit run-off occurs at the lowest altitude. The table on page 66 shows three comparisons between stations in the same basin for practically the same years, together with an analysis of each drainage area, showing percentages above different altitudes. The figures represent the natural run-off, as allowances have been made for the few diversions that affect the run-off.

Laramie River at Glendevey, Colo., with 13 per cent of its drainage area above an altitude of 11,000 feet, has a mean annual run-off of 880 acre-feet to the square mile. At the station near Woods, Wyo., only 3 per cent of the drainage area is above 11,000 feet, and the remaining 97 per cent, of which 38 per cent is below 9,000 feet, contributes so small a run-off that the unit run-off for the entire drainage area is reduced to 474 acre-feet. Similarly Deep Creek, a tributary of Rock Creek, with its entire drainage area between 10,000 and 11,000 feet, has a run-off of 1,340 acre-feet to the square mile, but Rock Creek itself, which has only 43 per cent of its drainage area above 10,000 feet, has a run-off of only 804 acre-feet to the square mile. South Boulder Creek near Rollinsville, with 94 per cent of its drainage area above 9,000 feet and 13 per cent above 11,000 feet, has a mean annual run-off of 1,180 acre-feet to the square mile. [fol. 2589] COMPLAINANT'S EXHIBIT No. 81

The Laramie River System of the Greeley-Poudre Irrigation District

The Greeley-Poudre Irrigation District, a quasi-public or municipal corporation, duly organized under the laws of the State of Colorado, is the owner and claimant herein of a general system of ditches, reservoirs and a tunnel now in process of construction in Water District No. 48, for the diversion, storage and conveyance of waters of the Laramie River and tributaries to the Cache la Poudre River, whence the same will be diverted into, and carried, stored, distributed and applied by means of a system of ditches and reservoirs in Larimer and Weld Counties, owned by the District, for the irrigation of 125,000 acres of land in Tps. 7 and 8 North, Range Sixty-seven West; Townships 7, 8 and 9 North, Range Sixty-six West; Townships 6, 7, 8 and 9 North, Range Sixty-four West; Townships 6, 7, 8 and 9 North, Range Sixty-three West, and Townships 7 and 9 North, Range Sixty-two West of the 6th P. M.; all in Weld County, Colorado, which lands go to make up and do constitute The Greeley-Poudre Irrigation District. The system of works, in Water District No. 48, shall be hereinafter designated in this and special findings as the "Laramie River System" of claimant and consists of the following several units, each of which is to a greater or less degree interdependent upon the other units operated therewith, all of which, working either alone or in conjunction one with another, constitute a complete system of works, the operation of each and all of the several units being necessary for the diversion and storage of water by the entire system:

[fol. 2590] The Rawah Ditch; The Rawah and Lower Supply Ditch; The McIntyre Ditch; The Deadman and Nunn Creek Ditch; The Laramie River Tunnel; The Link Lake Reservoirs, Nos. 1 to 14 inclusive; and The Tunnel Reservoir.

The system consists throughout of works requiring great financial outlay. It is located at elevations of from 8,500 feet to 11,500 feet above sea level, a portion thereof being at timber line and in the region of perpetual snows. All of the construction involves tunneling and excavation through

mountains and along the steep mountain sides on either side of the Laramie Valley, requiring a greater period of time in the completion thereof than would be required to complete an enterprise of like proportions situate under and surrounded by ordinary conditions. All supplies, machinery and labor must be transported by teams for a distance of from seventy to one hundred miles, in large part over mountain roads, from either Laramie, Wyoming, or Fort Collins, Colorado, under conditions least favorable to economical transportation.

Owing to the altitude, climatic conditions and geographical location of the system, the working season, during which men may be engaged in other than tunnel construction, and the season of transportation of freight, are limited to a short period of from three to four months out of each year. The remoteness of the works from railroads, towns, cities, and labor centers, makes the obtaining of laborers difficult, and requires payment of high wages and maintenance of expensive accommodations. The construction throughout is of hazardous character, requiring the use of dynamite, powder and other explosives and the services of a class of laborers hard to obtain and easily dissatisfied. The shortness of the working season requires a total disorganization of the entire laboring force at the close of each year's work and complete reorganization the next succeeding year. The foregoing and many other obstacles unknown to construction of irrigation works in plains or [fol. 2591] prairie regions or in regions of better climatic conditions and geographical location, require longer periods of time than would otherwise be necessary, reasonable diligence being a question of years as compared with months under ordinary conditions.

The construction of the system of works of the claimant upon the Laramie River were commenced by the initiation of surveys on August 25th, 1902, and since said date the work of engineering and construction has continued with diligence, notwithstanding financial and other obstacles although since 1911 active work upon said system has been in large measure suspended owing to the effect of litigation pending in the United States Supreme Court between Wyoming and Colorado, and involving the right of claimant to divert the waters of the Laramie River by means of this system of works.

The tunnel and other portions of said system are substantially complete and ready for diversion of water, while other portions are only in part constructed, all as will appear from the specific findings herein relative to each of the units of the system.

Owing to the conditions under which the work upon said system was commenced and since prosecuted and the many obstacles to be overcome, as well as those unmentioned as those hereinbefore specified, it is found that more than ordinary diligence has been exercised by the claimant, and its several predecessors, in the prosecution of said system of works from August 25th, 1902, to the present time.

This general finding shall apply to the whole system and each unit thereof and is made to avoid repetition insofar as possible. It shall apply to the several units of the system hereinatfer enumerated, without special findings or reference hereto in the findings for each unit, and shall be taken as incorporated in and as a part of the findings for each unit.

Each of the several units, while interdependent in large [fol. 2592] measure upon the other units of the system, nevertheless involves diversions from different tributaries of the Laramie River and is segregated into specific names and findings for the purpose of this decree. Each unit is given the same date of priority, and although different priority numbers are given, nevertheless each unit of said system shall have equal priority with each of the other units thereof.

[fol. 2593] Ditch No. 76—The Laramie River Tunnel of the Laramie River System

That said tunnel, as set forth in the findings herein, is entitled to Ditch Priority No. 75. It is claimed by The Greeley-Poudre Irrigation District, a corporation. It derives its supply of water from the Laramie River and the West Fork of the Laramie River. Its intake or point of beginning is on the east bank of the Laramie River, near the mouth of West Fork, and in the Northeast Quarter (NE¼) Southwest Quarter (SW¼) of Section Seven (7), Township Eight (8) North, Range Seventy-five (75) West of the 6th P. M., from which point it passes through and under the Green Mountains to the Cache la Poudre River. It is intended to be used for the diversion and carriage of

water from said streams to the Cache la Poudre River for the irrigation of the lands of claimant, and, also, as the principal unit or portion of the entire Laramie River System of the claimant, in conjunction with all the remaining units thereof, for the conveyance of all waters collected, regulated, diverted, conveyed and discharged at its west portion and into its Tunnel Reservoir, which said reservoir will be used for the regulation of the flow of water through said tunnel. It is 9½ feet wide by 7½ feet high in the clear and has a grade of 1.7 feet per thousand feet. Said tunnel is practically complete and ready for the carriage of water but no diversion or application of water from any of said sources has been made thereby, largely owing to litigation now pending between Wyoming and Colorado and involving the right to make such diversion.

It is hereby adjudged and decreed that said tunnel be given Ditch Priority No. 75, of date August 25, 1902, provided it be shown in a proper proceeding that it has been [fol. 2594] completed and water has been diverted and applied to the irrigation of lands within a reasonable time, but in no event shall said tunnel be awarded the right to divert from said several sources of supply more water than will flow through said tunnel as of the dimensions, grade and capacity aforesaid, when not used with its regulating basin, and in addition thereto, it shall be given the right to maintain the flow of water to its capacity when said tunnel is used in conjunction with the remaining units of said system for the carriage of water discharged into its west portal.

[fol. 2595] IN THE DISTRICT COURT

STATE OF COLORADO,
County of Laramie, ss:

I, Ray Baxter, Clerk of the District Court of the Eighth Judicial District of the State of Colorado, in and for the County of Larimer, do hereby certify the foregoing to be a full, true and complete copy of that part of the Report of Referee relating to the Laramie River System of the Greeley-Poudre Irrigation District and Ditch No. 76. The Laramie River Tunnel of the Laramie River System filed on the 14th day of February 1914 in Case No. 2725 entitled in the Matter of the Adjudication of Priorities of Water Rights in Irrigation District No. 48, of the State of Colo-

rado, for Irrigation and Other Beneficial Uses, as the same appears of record and on file in this office.

In Witness Whereof I have hereunto set my hand and affixed the seal of this Court at my office in Fort Collins, Colorado, this 27th day of February, A. D. 1928.

Ray Baxter, Clerk, by Eph F. Resek, Deputy. (Seal District Court, Larimer County, Colorado.

(663) No. 2725

In the Matter of the Adjudication of Priorities of Water Rights in Irrigation District No. 48, of the State of Colorado, for Irrigation and Other Beneficial Uses.

In the Matter of the Claim of The Greeley-Poudre Irrigation District for the Link Lake Reservoir No. 1.

ABRAHAM I. AKIN, being produced and sworn, testifies as follows:

Q. What is your name?
A. Abraham I. Akin.
Q. What is your post office address?
A. Fort Collins, Colorado.
Q. You are the same Abraham I. Akin who has testified in general with relation to the Laramie river system of The Greeley-Poudre Irrigation District in this proceeding?
A. I am.
Q. I will ask you whether or not you are familiar with Link Lake Reservoir No. 1?
A. I am.
Q. State whether or not that lake and reservoir constitutes a part of the Laramie river system concerning which you have testified.
A. It does.
Q. When did you first become familiar with that lake?
A. In August, 1902.
Q. Is it a natural lake or artificial in its present state?
A. In its present state it is a natural reservoir.
Q. With whom were you at the time you first became familiar with this lake?

A. Wallace A. Link.

Q. Is the lake capable of use as a reservoir for the storage of water for irrigation or domestic purposes?

A. It is.

Q. In its natural state could it be used by the installation of (664) outlet works?

[fol. 2597] A. Yes, sir; it could.

Q. State whether or not it is capable of use in conjunction with any of the ditches of the Laramie river system of the claimant for the more economic diversion and regulation of the flow of water in such ditches.

A. It is.

Q. What ditches is it capable of use with?

A. The Upper Rawah ditch of the Laramie-Poudre system and the Lower Rawah ditch, emptying into the Tunnel Reservoir.

Q. I will ask you where this lake is located.

A. It is located in the south east quarter of section 7, township 8 north, range 78 west.

Q. How many acres does it cover?

A. Thirty acres.

Q. Is that its present area?

A. Yes, sir.

Q. Is it feasible to construct this lake either by the installation of outlet works or the construction of a dam, or both, so as to hold water for storage?

A. It is.

Q. What is its depth?

A. Thirty-five feet.

Q. And at that depth of water what would the storage capacity of the lake be?

A. 45,738,000 cubic feet.

Q. When was work commenced by survey on this reservoir or the system of which it constitutes an essential part?

A. August 25, 1902.

Q. Were you present at that time?

A. Yes, sir.

Q. Who did the surveying?

[fol. 2598] A. (665 & 666) Frank Beach and myself.

Q. Out of what stream do the waters flow that fill this lake?

A. One branch of the Rawah Creek.

Q. Is it situated above or below the line of the Rawah ditch?

A. Above.

Q. By what means are the waters which can be stored in this lake, conveyed to the Laramie river tunnel? Describe, starting at the lake.

A. They are drawn from the lake through an outlet and from there through Rawah Creek, through No. 2 Reservoir and No. 3 reservoir of the system and taken out in the Upper Rawah ditch or the Lower Rawah ditch as needed.

Q. Are those waters taken out either by the Upper or Lower Rawah ditch at the points of interseption of the ditches with Rawah Creek?

A. Yes, sir.

Q. And if they are conveyed by the Rawah ditches where are they discharged?

A. In the Tunnel Reservoir.

Q. And from the Tunnel Reservoir?

A. Through the tunnel to the Cache la Poudre river.

Abraham I. Akin.

Subscribed and sworn to before me this 22d day of March, A. D. 1912.

L. R. Temple, Referee.

[fol. 2599] No. 76—The Laramie River Tunnel of the Laramie River System

(1100) The claimant of this tunnel is The Greeley-Poudre Irrigation District, a quasi-public or municipal corporation, organized and doing business under the laws of the State of Colorado, whose postoffice address is Greeley, Weld County, Colorado.

The Laramie River Tunnel, when used in its capacity as a single diversion unit of the Laramie River System of the claimant and without regard to the use thereof for the carriage of water delivered to it by other units of the system, derives its supply of water from the Laramie River and the West Fork of the Laramie River and all tributaries of each of said streams entering the same above the mouth of said West Fork. Said waters are diverted and conveyed, by said tunnel, through the Green Mountains to the Cache la Poudre River for use by the claimant, its water users and consumers, by rediversion and carriage, storage and application through the remainder of its system of works in Larimer and Weld Counties.

This tunnel is sometimes known as "The Laramie-Poudre Tunnel," or "The Greeley-Poudre Tunnel," of the claimant. It not only diverts and carries waters from the aforesaid streams in the manner as above stated, but, in addition thereto, is used with each and every of the several other units of the Laramie River System of claimant for the carriage of waters diverted, stored, carried and discharged by each and all of said units into said tunnel or into its regulating basin, the Tunnel Reservoir, situate at the west portal of said tunnel.

The intake or point of beginning of the said tunnel is on the east bank of the Laramie River at the mouth of the West Fork and in the NE¼ SW¼ of Section Seven (7), Town- [fol. 2600] ship Eight (8) North, Range 75 West (1101) of the 6th P. M., in Larimer County, Colorado, in Water District No. 48. From thence water is conveyed through an open cut for about 1100 feet to and into the west portal of said tunnel, from which point said tunnel extends in a general easterly-southeasterly direction under and through a range of mountains known as the Green Mountains and constituting the water shed between the Laramie and Cache la Poudre Rivers, a distance of about 12400 feet (including the 1100 feet of open cut aforesaid) and through portions of Sections 7, 8, 9 and 16, Township 8 North, Range 75 West of the 6th P. M. The waters conveyed through said tunnel are discharged near a point in the NW¼ NE¼ of Section Sixteen (16), Township 8 North, Range 75 West of the 6th P. M., whence the northwest corner of said Section 16 bears South 81° 35′ West about 3280 feet distant, and flow thence to the Cache la Poudre River.

Said tunnel is 9½ feet wide by 7½ feet high in the clear. It has a grade of 1.7 feet per one hundred feet and an estimated carrying capacity, without pressure of water in the Tunnel Reservoir, of about 1,000 cubic feet of water per second of time.

Said tunnel has a two-fold purpose, to-wit:

1st. For the diversion of waters from the Laramie River and the West Fork thereof at its point of intake and the conveyance of said waters to and into the Cache la Poudre River for purposes of irrigation as aforesaid.

2nd. As an integral part, unit or portion of the entire Laramie River System of ditches, reservoirs and tunnel of claimant, including the McIntyre, Rawah, Rawah & Lower

Supply and Deadman and Nunn Creek Ditches, the Link Lakes Reservoirs and the Tunnel Reservoir, each in this proceeding by separate findings described, and to be used in conjunction with the said remaining units or portions of said system for the conveyance of the waters collected, regulated, carried and discharged at the west portal by said [fol. 2601] ditches and (1102) reservoirs, in such manner as to give the maximum diversion, collection, storage and carrying capacity to said system and its various units or parts for the irrigation of 125,000 acres of land.

The increased head or pressure at the west portal of said tunnel, occasioned by increased depth of water in the Tunnel Reservoir, will give said tunnel an additional estimated carrying capacity of about 235 cubic feet of water per second of time, when said reservoir is filled to its high water line, and a total estimated carrying capacity of 1235 cubic feet of water per second of time by the use of said reservoir as a regulating, accumulation or controlling basin.

Work was commenced on said tunnel, along with the several other units of said Laramie River System of claimant, on or about August 25, 1902, and has since hitherto been prosecuted with exceptional diligence by claimant and its predecessors in title and interest, having been constructed at a speed exceeding all records theretofore established in the history of tunnel construction in tunnels of like dimension. The rock work was completed July 25, 1911, since which date various improvements have been made upon the same by claimant. It has not been used for the diversion or carriage of water owing to conditions growing, in large measure, out of litigation between Wyoming and Colorado, pending in the United States Supreme Court and involving the right of claimant to use said tunnel for the diversion of waters of the Laramie River. Owing to the fact that no diversion or beneficial use of water has been made by means of said tunnel, no findings and decree in that behalf can be made, save as to the date and number of its priority, which is hereby fixed as of August 25, 1902, and its priority is numbered Ditch Priority No. 75. The amount of its appropriation when finally fixed and determined, shall be limited to its present dimensions, grade and capacity from all sources of supply and diverted by said tunnel and each of its said co-ordinate units, for the irrigation of not to exceed 125,000 acres of land.

[fol. 2602] Reservoir No. 5—Link Lake Reservoir No. 1 of the Laramie River System

(1215) That said reservoir, as set forth in the findings herein, is entitled to Reservoir Priority No. 4. It is claimed by the Greeley-Poudre Irrigation District, a corporation. It is located in Larimer County, Colorado, upon the SE¼ of Section Seven (7), Township Eight (8) North, Range 76 West of the 6th P. M. It will be constructed across a branch of Rawah Creek and has no inlet ditch, said creek serving to convey water to said reservoir. Rawah Creek is used to convey waters from its outlet to the Laramie River Tunnel, by way of The Rawah Ditch or The Rawah & Lower Supply Ditch of claimant. It derives its supply of water from said branch of Rawah Creek, being that portion of said stream lying between the crest of the Medicine Bow range of mountains and said reservoir. This reservoir is intended to be used for the storage of water for irrigation, and, also, as an essential part of the Laramie River System of the claimant for regulating the flow of water through said system and to the Cache la Poudre River. The said reservoir is not as yet constructed, but it is intended to be constructed as follows: Area at high water line 30 acres, depth of water to be stored 35 feet and estimated storage and regulating capacity 45,738,000 cubic feet.

It is hereby adjudged and decreed that said reservoir be given Reservoir Priority No. 4, of date August 25 1902, provided it be shown in a proper proceeding that said reservoir has been completed and water has been diverted and applied thereby to the irrigation of lands within a reasonable time, but in no case shall the amount decreed said reservoir excel a storage depth of 35 feet above the bottom of the outlet tube and a capacity of 45,738,000 cubic feet.

[fol. 2603] In the District Court

State of Colorado,
County of Larimer, ss:

I, Ray Baxter, Clerk of the District Court of the Eighth Judicial District of the State of Colorado, in and for the County of Larimer, do hereby certify the foregoing to be a full and true copy of testimony of Abraham I. Akin in the Matter of the Claim of The Greeley-Poudre Irrigation District for the Link Lake Reservoir No. 1; and part of the

Decree relating to Reservoir No. 5, Link Lake Reservoir No. 1 of the Laramie River System and that part of the Decree relating to No. 76. The Laramie River Tunnel of the Laramie River System; said Decree having been signed on February 20, 1914 by Judge Neil F. Graham, and L. R. Temple being Referee all in Case No. 2725 entitled In the Matter of the Adjudication of Priorities of Water Rights in Irrigation District No. 48, of the State of Colorado, for Irrigation and Other Beneficial Uses, all of which appear of record and on file in this office.

In witness whereof I have hereunto set my hand and affixed the seal of this Court at my office in Fort Collins, Colorado, this 17th day of April, A. D. 1931.

Ray Baxter, Clerk, by Eph. F. Resek, Deputy. (Seal) District Court, Larimer County, Colorado.)

[fol. 2604] COMP. EXHIBIT No. 83

STATE OF COLORADO,
State Engineer's Office, ss:

I, M. C. Hinderlider, State Engineer of the State of Colorado, do hereby certify that the attached tabulations (consisting of three sheets) is a true and correct statement of the decrees awarded the ditches and reservoirs mentioned in said tabulation as evidenced by certified copies of decrees furnished this office by the District Courts in which said ditches and reservoirs are located.

Further, that portion of the tabulation headed "Discharge and Storage Records" is a true and correct statement of the maximum discharge of the ditches and storage in the reservoirs mentioned in said tabulations, as evidenced by the records of the Water Commissioners in the Water Districts in which said ditches and reservoirs are located.

Given under my hand and official seal this 13th day of October, A. D. 1926.

M. C. Hinderlider, State Engineer, by C. C. Hezmalhalch, Deputy. (Seal State Engineer of Colorado.)

[fol. 2608] Comp. Exhibit No. 84

No. 73—The Rawah & Lower Supply Ditch of the Laramie River System

The claimant of this ditch is The Greeley-Poudre Irrigation District, a quasi-public or municipal corporation, organized and doing business under the laws of the State of Colorado, whose postoffice address is Greeley, Weld County, Colorado.

Said ditch takes its supply of water from Rawah, West Springer, Rapid, Fall, Winifred, Mill and divers other creeks situate between the Rawah Creek and the Laramie River Tunnel, each of which said creeks is a tributary of the Laramie River, entering said stream on the west side thereof and is intersected by the said canal and the waters of each thereof are diverted and conveyed by means of said ditch to the Tunnel Reservoir of the claimant, and thence through the Laramie River Tunnel to the Cache la Poudre River.

This ditch is sometimes known as "The Lower Supply Ditch," "The Lower Rawah Ditch," "The West Side Collection Ditch," "The West Side Ditch" or "The West Feeder Ditch," and includes under one name separate units of said ditch line heretofore known as "The Rawah Pipe Ditch," "The Rawah Pipe Line," "The Fall Creek Ditch," and "The Fall Creek Pipe Line," (said pipe lines being now substituted by tunnels along the line of this ditch) of the Laramie River System of claimant. The said ditch not only diverts and carries water from the several streams and tributaries of the Laramie River aforesaid, but also, and in conjunction with the Rawah Ditch, McIntyre Ditch, Link Lakes Reservoirs and Tunnel Reservoir, will be used for the carriage of waters stored in Link Lakes Reservoirs or diverted from McIntyre Creek by means of the McIntyre Ditch, in manner more specifically set forth in the findings and decree pertinent to said reservoirs and McIntyre Ditch.

[fol. 2609] The headgate or place of beginning of said ditch is in the east or south bank of Rawah Creek in Larimer County, Colorado, near a point in the Southwest Quarter (SW¼) Southeast Quarter (SE¼) of Section Fourteen (14), Township Nine (9) North, Range Seventy-six (76) West of the 6th P. M., whence the southeast corner of said section bears South 71 degrees 0′ West about 2540 feet distant. Said ditch extends thence in a general southeasterly direction a distance of about 4.7 miles and traverses portions of Sections 14, 23, 25, 26 and 36 in Township Nine (9) North, Range 76 West; Sections 1 and 12, Township Eight (8) North, Range 76 West, and Section 7, Township Eight (8) North, Range 75 West of the 6th P. M., to the east terminus thereof, being the point where the said ditch discharges its waters into the bed and channel of the Lara-

mie River, at or near the west portal of the Laramie River Tunnel and into the accumulation basin of the Tunnel Reservoir. The said ditch intersects the several streams aforesaid along its course, and has at each of said points of intersection appliances for diversion, thereby constituting, as to each of such, a point of diversion at the said point of intersection of the line of said ditch with the thread of each of such streams.

The said ditch is divided into four divisions, for purpose of description, each of which are, or will be when complete, of the following dimensions, length and capacities:

Division	Material	Bottom width	Side slopes of banks	Depth water	Grade, per 1000 ft.
Rawah Creek	loose	9 ft.	1 to 1	4 ft.	2 ft.
	solid	8 ft.	1-2-to 1	4 ft.	3 ft.
Rapid Creek	loose	10 ft.	1 to 1	4.5 ft.	1.5 ft.
	solid	9 ft.	1-2 to 1	4.5 ft.	3 ft.
Fall Creek	loose	11 ft.	1 to 1	4.5 ft.	1.5 ft.
	solid	10 ft.	1-2 to 1	4.5 ft.	2.7 ft.
Mill Creek	loose	11 ft.	1 to 1	4.6 ft.	1.5 ft.
	solid	10 ft.	1-2 to 1	4.6 ft.	2.7 ft.

Length: feet	Cap. cu. ft.	3100	275
16000	200		
2400	250		
3300	270		

[fol. 2610] The Link Lakes Reservoirs Nos. 1 to 14, inclusive, as well as the Tunnel Reservoir, are claimed as regulating or expansion basins and works for this ditch, and the Rawah Ditch, hereinafter mentioned, as will appear in the specific findings and decree for each of said reservoirs, and the waters diverted and carried by this ditch are for final discharge into the Cache la Poudre River through the Laramie River Tunnel of claimant.

The said ditch constitutes an essential unit or portion of the diversion and storage system of the claimant in Water District No. 48, and is to be so used in conjunction with the remaining units of said system as to give to the claimant the maximum diversion, storage and carrying capacity of said system and its several units, including this unit, when used singly or in conjunction with one another for the irrigation of not to exceed 125,000 acres of land.

Work was commenced upon this ditch, along with the several other ditches and reservoirs and the tunnel going to make up the several units of the Laramie River diversion and storage system of claimant, on or about August 25,

1902, and has since hitherto been prosecuted with due diligence by the claimant and its predecessors in title and interest, but owing to the fact that said ditch is not wholly completed and no diversion of water has been made thereby no findings in behalf of said ditch can be made, save as to the date and number of its priority, which are hereby fixed as August 25, 1902, and its priority is numbered Ditch Priority No. 72. The amount of its appropriation, when finally fixed and determined, insofar as its diversion along its line from aforesaid creeks is concerned, shall be limited to 275 cubic feet of water per second of time from all of said streams, with privilege of maintaining the flow in said ditch constant at said capacity by use of the Link Lakes Reservoirs and the Rawah and McIntyre Ditches and other works of the district as expansion, regulating and co-ordinate works, and sufficient by diversions of this and all the other units of said system for the irrigation of not to exceed 125,000 acres of land.

[fol. 2611] Ditch No. 73—The Rawah & Lower Supply Ditch of the Laramie River System

That said ditch, as set forth in the findings herein, is entitled to Ditch Priority No. 72. It is claimed by The Greeley-Poudre Irrigation District, a corporation. It derives its supply of water from Rawah, West Springer, Rapid, Fall, Winifred, Mill and divers other streams, tributary to the Laramie River, entering said stream on the west side thereof between Rawah Creek and the West Fork of the Laramie River. This ditch has its first or principal headgate on the east or south bank of Rawah Creek in Larimer County, Colorado, near a point in the Southwest Quarter (SW¼) Southeast Quarter (SE¼) of Section Fourteen (14), Township Nine (9) North, Range Seventy-six (76) West of the 6th P. M., whence the southeast corner of said section bears South 71 degrees 0′ West about 2540 feet distant, from which point it runs in a general southeasterly direction to the bed and channel of the Laramie River at a point near the west portal of the Laramie River Tunnel and in the Tunnel Reservoir, and from which said point of delivery said waters are conveyed through the Laramie River Tunnel to the Cache la Poudre River. It intersects the lines of said streams situate between Rawah

Creek and the West Fork of the Laramie River and has points of diversion as to each thereof, said points being in each instance identical with the point of intersection of said ditch with the south or east banks of said streams. It is intended to be used for the diversion and carriage of waters from the several streams above mentioned to the Laramie River Tunnel and its Tunnel Reservoir and thence to the Cache la Poudre River for the irrigation of the lands of claimant, and, also, as an essential part of the Laramie River System of the claimant for the carriage of waters stored and regulated in the Link Lakes Reservoirs, or waters conveyed by the McIntyre Ditch and delivered at the headgate of this ditch by use of Rawah Creek.

[fol. 2612] It is not fully completed and no water has been by it diverted or applied to a beneficial use. The dimensions, grade, size and carrying capacity of said ditch vary from the point of beginning to the point of discharge and are divided into four divisions, as follows:

Division	Material	Bottom width	Side slopes of banks	Depth water	Grade per 1000 ft.	Length feet	Cap. cu. ft.
awah Creek	Loose	9 ft.	1 to 1	4 ft.	2 ft.	16000	200
	Solid	8 ft.	1–2 to 1	4 ft.	3 ft.		
apid Creek	Loose	10 ft.	1 to 1	4.5 ft.	1.5 ft.	2400	250
	Solid	9 ft.	1–2 to 1	4.5 ft.	3 ft.		
all Creek	Loose	11 ft.	1 to 1	4.5 ft.	1.5 ft.	3300	270
	Solid	10 ft.	1–2 to 1	4.5 ft.	2.7 ft.		
ill Creek	Loose	11 ft.	1 to 1	4.6 ft.	1.5 ft.	3100	275
	Solid	10 ft.	1–2 to 1	4.6 ft.	2.7 ft.		

It is hereby adjudged and decreed that said ditch be given Ditch Priority No. 72, of date August 25, 1902, provided it be shown in a proper proceeding that it has been completed and water has been diverted and applied to the irrigation of lands within a reasonable time, but in no event shall said ditch be awarded the right to divert from said several sources of supply more than 275 cubic feet of water per second of time, with the right to maintain the flow in said ditch to said capacity by the conjunctive use of said ditch with the Link Lakes Reservoirs and the McIntyre Ditch.

[fol. 2613] IN THE DISTRICT COURT

STATE OF COLORADO,
County of Larimer, ss:

I, W. P. Hurley, Clerk of the District Court of the Eighth Judicial District of the State of Colorado, in and for the County of Larimer, do hereby certify the foregoing to be a full, true and complete copy of Findings and Decree entered in this Court in Case No. 2725 entitled: In the Matter of the Adjudication of Priorities of Water Rights in Irrigation District No. 48, of the State of Colorado, for Irrigation and Other Beneficial Uses, said Decree being signed by the Honorable Neil F. Graham, Judge, (L. R. Temple, Referee) on the 20th day of February, A. D. 1914, and all as appears of record and on file in this office.

In witness whereof I have hereunto set my hand and affixed the seal of this Court at my office in Fort Collins, Colorado, this 24th day of April, A. D. 1933.

W. P. Hurley, Clerk, by Gertrude Fritz, Deputy.
(Seal District Court, Larimer County, Colorado.)

[fol. 2614] COMPLAINANT'S EXHIBIT No. 85

THE STATE OF WYOMING,
County of Laramie, ss:

I, Edwin W. Burritt, Ex Officio Secretary, State Board of Control, do hereby certify that the annexed copy is a full, true, correct, and complete copy of the Certificates of Appropriation which have been issued, complying with the

Order of the Board of Control, as recorded on page 236 of Order Record 7 and entitled: "In the Matter of the Adjudication of Priorities of the Right of the Use of the Waters of the Big Laramie River and Its Tributaries, being Civil Docket No. 8, Nos. 96 to 107 inclusive, in the District Court, First Judicial District, Laramie County, Wyoming" as the same pertain to Sand Creek and tributaries—tributary of the Laramie River.

Witness my hand and the seal of said Board this 25th day of April, 1933.

Edwin W. Burritt, Ex Officio Secretary. (Seal Board of Control, State of Wyoming.)

THE STATE OF WYOMING

Priority No. 1

Certificate of Appropriation of Water

Certificate Record No. 48, Page 141

WHEREAS, on December 27, 1912 there was entered in the District Court of the First Judicial District within and for Laramie County, State of Wyoming, a decree, and on December 5, 1928 a copy thereof was duly certified to the State Board of Control, which said decree adjudicated certain priorities of the right to the beneficial use of the waters of Big Laramie River and its tributaries, and

WHEREAS, Wyoming Central Land & Improvement Co. presented evidence establishing proof of appropriation of water from Sand Creek, tributary of Laramie River, through Gullihur No. 2 Ditch for irrigation of the lands hereinafter described in Albany County, Wyoming.

NOW KNOW YE, That the State Board of Control, under the provisions of Chapters 65 and 68, Wyoming Compiled Statutes, 1920, and amendments thereto, has, by an order duly made and entered on the 19th day of November, A. D. 1929, in Order Record 7, Page 260, confirmed and established the priority and amount of such appropriation in accordance with said Court Decree, as follows:

Name of Appropriator Wyoming Central Land & Improvement Co.; Postoffice Address Laramie, Wyoming;

Amount of Appropriation 2.8 cu. ft. per sec; Date of Appropriation 1871

Total Acreage One Hundred Ninety-six (196) acres

Description of land irrigated:

TWP	RANGE	SEC.	NE¼				NW¼				SW¼				SE¼				TOTAL
			NE¼	NW¼	SW¼	SE¼	NE¼	NW¼	SW¼	SE¼	NE¼	NW¼	SW¼	SE¼	NE¼	NW¼	SW¼	SE¼	
14 N	74 W	5				8	Lot3		5	27	40	36	40	40					196

The right to the beneficial use of said water hereby confirmed and established is limited to irrigation and said use is restricted to the place where, and to the purpose for which acquired. Appropriations are limited to the amount of water which is actually applied to beneficial use which in the case of irrigation can not exceed one cubic foot per second of time for each seventy acres of said land.

IN TESTIMONY WHEREOF I, John A. Whiting, President of the State Board of Control, have hereunto set my hand this 30th day of March, A. D. 1932, and caused the seal of said Board to be hereunto affixed.

Certificate of Appropriation of Water

Certificate Record No. 48, Page 148

WHEREAS, on December 27, 1912 there was entered in the District Court of the First Judicial District within and for Laramie County, State of Wyoming, a decree, and on December 5, 1928 a copy thereof was duly certified to the State Board of Control, which said decree adjudicated certain priorities of the right to the beneficial use of the waters of Big Laramie River and its tributaries, and

WHEREAS, The Denver-Laramie Realty Co. presented evidence establishing proof of appropriation of water from Sand Creek, tributary of Laramie River through Gullihur No. 2 Ditch for irrigation of the lands hereinafter described in Albany County, Wyoming.

NOW KNOW YE, That the State Board of Control, under the provisions of Chapters 65 and 68, Wyoming Compiled Statutes, 1920, and amendments thereto, has, by an order duly made and entered on the 19th day of November, A. D. 19 29, in Order Record 7, Page 260, confirmed and established the priority and amount of such appropriation in accordance with said Court Decree, as follows:

Name of Appropriator The Denver-Laramie Realty Co.; Postoffice Address Denver, Colorado, Wyoming;

Amount of Appropriation 3.? cu. ft. per sec; Date of Appropriation 1880

Total Acreage Two Hundred Twenty-four (224) acres

Description of land irrigated:

TWP	RANGE	SEC.	NE¼				NW¼				SW¼				SE¼				TOTAL
			NE¼	NW¼	SW¼	SE¼	NE¼	NW¼	SW¼	SE¼	NE¼	NW¼	SW¼	SE¼	NE¼	NW¼	SW¼	SE¼	
14 N	74W	8					40	40	40	26	10	40	10	18					224

The right to the beneficial use of said water hereby confirmed and established is limited to irrigation and said use is restricted to the place where, and to the purpose for which acquired. Appropriations are limited to the amount of water which is actually applied to beneficial use which in the case of irrigation can not exceed one cubic foot per second of time for each seventy acres of said land.

IN TESTIMONY WHEREOF I, John A. Whiting, President of the State Board of Control, have hereunto set my hand this 30th day of March, A. D. 19 32, and caused the seal of said Board to be hereunto affixed.

THE STATE OF WYOMING

Certificate of Appropriation of Water

Certificate Record No. 48, Page 161

WHEREAS, on December 27, 1912 there was entered in the District Court of the First Judicial District within and for Laramie County, State of Wyoming, a decree, and on December 5, 1928 a copy thereof was duly certified to the State Board of Control, which said decree adjudicated certain priorities of the right to the beneficial use of the waters of Big Laramie River and its tributaries, and

WHEREAS, J. M. Hoge presented evidence establishing proof of appropriation of water from Sand Creek, tributary of Laramie River, through Lone Tree or Antelope Ditch for irrigation of the lands hereinafter described in Albany County, Wyoming.

NOW KNOW YE, That the State Board of Control, under the provisions of Chapters 65 and 68, Wyoming Compiled Statutes, 1920, and amendments thereto, has, by an order duly made and entered on the 19th day of November, A. D. 19 29 in Order Record 7, Page 261, confirmed and established the priority and amount of such appropriation in accordance with said Court Decree, as follows:

Name of Appropriator J. M. Hoge; Postoffice Address Laramie, Wyoming; Amount of Appropriation 5.85 cu. ft. per sec; Date of Appropriation March 17, 1894

Total Acreage Four Hundred Ten (410) acres.

Description of land irrigated:

TWP	RANGE	SEC.	NE¼				NW¼				SW¼				SE¼				TOTAL
			NE¼	NW¼	SW¼	SE¼	NE¼	NW¼	SW¼	SE¼	NE¼	NW¼	SW¼	SE¼	NE¼	NW¼	SW¼	SE¼

Certificate of Appropriation of Water

Certificate Record No. 48, Page 189

WHEREAS, on December 27, 1912 there was entered in the District Court of the First Judicial District within and for Laramie County, State of Wyoming, a decree, and on December 5, 1928 a copy thereof was duly certified to the State Board of Control, which said decree adjudicated certain priorities of the right to the beneficial use of the waters of Big Laramie River and its tributaries, and

WHEREAS, F. B. Collins presented evidence establishing proof of appropriation of water from Running Water, tributary of Sand Creek through the Collins Ditch No. 2 for irrigation of the lands hereinafter described in Albany County, Wyoming.

NOW KNOW YE, That the State Board of Control, under the provisions of Chapters 65 and 68, Wyoming Compiled Statutes, 1920, and amendments thereto, has, by an order duly made and entered on the 19th day of November, A. D. 19 29, in Order Record 7, Page 263, confirmed and established the priority and amount of such appropriation in accordance with said Court Decree, as follows:

Name of Appropriator F. B. Collins; Postoffice Address Laramie, Wyoming;

Amount of Appropriation .28 cu. ft. per sec; Date of Appropriation 1884

Total Acreage Twenty (20) acres

Description of land irrigated:

TWP	RANGE	SEC.	NE¼				NW¼				SW¼				SE¼				TOTAL
			NE¼	NW¼	SW¼	SE¼	NE¼	NW¼	SW¼	SE¼	NE¼	NW¼	SW¼	SE¼	NE¼	NW¼	SW¼	SE¼

		6											2	8					10
																			20

The right to the beneficial use of said water hereby confirmed and established is limited to irrigation and said use is restricted to the place where, and to the purpose for which acquired. Appropriations are limited to the amount of water which is actually applied to beneficial use which in the case of irrigation can not exceed one cubic foot per second of time for each seventy acres of said land.

IN TESTIMONY WHEREOF I, John A. Whiting, President of the State Board of Control, have hereunto set my hand this 30th day of March, A. D. 19 32, and caused the seal of said Board to be hereunto affixed.

Denver

M. C. Hinderlider, State Engineer; C. C. Hezmalhalch, Deputy; J. Harold Baily, Chief Hydrographer

October 5th, 1928.

Miss Agnes Zimmerman, Home, Colorado.

Subject: Greeley-Poudre Tunnel

DEAR MISS ZIMMERMAN:

Your letter of September 30th, addressed to Mr. Baily, requesting information on the Venturi Flume at the outlet of Greeley-Poudre Tunnel, has been referred to the writer for reply.

The flume in question was not installed by the writer, but was constructed under the supervision of Mr. Parshall of the Department of Irrigation Investigations. It is a 6 ft. timber structure placed within the section of the lower end of the concrete flume below the outlet of the tunnel.

Soon after installation, this flume was carefully checked and rated by Mr. Parshall and his assistant Mr. Rohwer, at which time a new gage was installed for checking the automatic register. Mr. Parshall immediately advised me of the results of his measurements, which seemed to check quite closely with the standard Venturi tables, copy of which you doubtless have. Based upon this information, the Water Commissioner was directed to use such tables in determining the amount of water discharged by the Tunnel.

There appears to be considerable variance between Mr. Baily's measurement of September 26th, when he found 11.86 sec. ft., and the standard rating tables. This discharge is for a gage height of 0.57. As a result of this measurement by Mr. Baily, I immediately called up Mr. Rohwer, assistant to Mr. Parshall, and asked him to make further investigations, which he did on the 5th inst., and reports the following:

[fol. 2658] For a gage height of 0.575, a discharge of 9.85 sec. ft. For this same gage height, the Venturi flume tables give a discharge of 9.93 sec. ft., which is practically a check.

We questioned Mr. Baily on the accuracy of his work, and he is unable to understand the reason for the discrepancy between his measurement and the result of Mr. Rohwer's. Due to the fact that Mr. Rohwer was instructed by me to use particular care, and had an engineer's level for checking the soundings and gage readings, I would be inclined to accept his results.

Very truly yours, M. C. Hinderlider, State Engineer.

MCH/bc.

[fol. 2666] COMP. EXH. No. 97

MEMORANDUM CONCERNING CURRENT METER GAGINGS MADE ON THE 6-FOOT PARSHALL MEASURING FLUME AT EAST PORTAL OF LARAMIE-POUDRE WATERSHED

This structure was built early in the spring of 1927 for the purpose of measuring the water diverted from the Laramie River through this tunnel in the Poudre watershed. The ordinary rectangular rating flume formerly used was found to be impractical because of the debris from the tunnel lodging on the floor of the flume. This trouble still persists.

Appended is a tabulation showing the results of eight current meter ratings made on this 6-foot Parshall measuring flume at the tunnel during the period 1927-1932. It will be noted that the percentage of deviation is considerable for some of the measurements because of deposits of rocks and boulders in the approach section of the flume, as indicated by the accompanying photograph which was made July 5, 1932, showing the current all to one side and a rock barrier which interferes with the flow. The gaging made July 5, 1932, with a measured discharge of 37.06 second feet was for the identical condition as shown in the picture, the gaging section being just upstream from the H_a gage. This measurement shows a wide variation in the velocity across the section. Whereas, with the gaging made July 10, 1932, for the same condition, the section chosen was about 3 feet upstream from the crest, this giving a somewhat better distribution of velocities.

In my opinion it is asking too much of this type of measuring device to measure within practical limits under conditions imposed here because of the debris and unbalanced velocity conditions.

R. L. Parshall.

Home, Colo.,
Sunday, April 9, 1933.

Visited eastern end of Larimie Poudre Tunnel at 10:30 A. M. today. Found .45 ft. of water running thru Venturi flume (6 ft. Parshall Venturi). Gauge well was dry and gauge not running. Chart on automatic gauge undated and had been used some. Gauge of Bristol make. Ice covered ¾ of flume but above water, that is suspended by being frozen to right side of flume.

[fol. 2674] DEFENDANT'S EXHIBIT B

Same to Roy Portner, Ft. Collins.
Bruce Eaton, Eaton, Colo.
H. D. Parker, Greeley.

March 7, 1928.

Mr. A. C. Kluver, Water Supply & Storage Co., Fort Collins, Colo.

DEAR MR. KLUVER:

Request has been made to the writer by the State Engineer of Wyoming, for permission to establish automatic registers on all ditches diverting water from the Laramie River into the Poudre River, and to make measurements of such diversions from time to time, all in cooperation with this office, with the understanding that all records and data secured shall be furnished this office upon request.

His reason for making this request is that it has been reported to the Reclamation Bureau that the large quantities of water now being diverted by Colorado interests from the Laramie River, will so deplete the available water supplies in the Laramie River as to make unjustifiable the building of certain extensions to what is known as the Wheatland Project in Wyoming which the state authorities up there are seeking to have done.

This office of course has no authority to restrain the State Engineer of Wyoming coming into Colorado and making such investigations, even tho we were convinced that the result of such investigations might be inimical to the interests of our citizens.

Mr. Whiting, State Engineer, advises me that he would not want to make such investigations, however, if seriously objected to by this office.

At the present time it does not appear that such investigation would be detrimental to our interests, and if they are to be made I would prefer that they be made in a cooperative way, so that we would have access to all of the inform-
[fol. 2674a] ation obtained.

Prior to giving final reply to the State Engineer of Wyoming, I would first like to have an expression from you as

to whether you would oppose such investigation as inimical to the interests of your company.

An early reply will oblige.

Very truly yours, State Engineer.

MCH/be.

[Stamp:] Received Mar. 14, 1928. State Engineer of Colo.

Law Offices of Lawrence R. Temple, Fort Collins, Colo.

March 13, 1928.

Mr. M. C. Hinderlider, State Engineer, Denver, Colorado.

DEAR MR. HINDERLIDER:

Referring to your letter of March 7th to The Water Sup- Supply & Storage Company in the matter of a request of the State Engineer of Wyoming, to establish automatic registers in the Skyline Ditch:

You will understand that our company now has a register in the ditch and the diversions from the Larimie River are all measured, and have been measured for a great many years through that register. The register has been checked by your office on various occasions and is presumed to be correct.

We are perfectly willing to co-operate with Mr. Whiting in the ditch and the diversions from the Larimie River are being willing to turn our ditch over to the State of Wyoming for the purpose of giving it information which might lead to costly litigation at some time in the future.

Before agreeing to any investigation I feel it would be advisable to have a full understanding with the State of Wyoming and I therefore suggest that so far as our Company is concerned we would like a conference with the State officials of Wyoming and your office in order that we may arrive at a full understanding at just what they may have in view.

The officers of The Water Supply & Storage Company will be at your service in this matter at any time you may

desire and a conference may be had either in Cheyenne or Denver as you and Mr. Whiting may determine.

Yours truly, L. R. Temple.

LRT:AW.

[fol. 2676] DEFENDANT'S EXHIBIT D

[Stamp:] Received Mar. 22, 1928. State Engineer of Colo.

The Laramie-Poudre Irrigation Co.

H. D. Parker, Pres. G. F. Smith, Sec'y

Greeley, Colorado, March 16, 1928.

Hon. M. C. Hinderlider, State Engineer, State Capitol Building, Denver Colo.

In re: Automatic Registers, Greeley-Poudre Tunnel

MY DEAR MR. HINDERLIDER:

We have delayed answering yours of the 7th inst., in which you call attention to the request of the State Engineer of Wyoming for permission to establish automatic registers on all ditches diverting water from the Laramie River into the Poudre River, until we were able to discuss the matter with Delph E. Carpenter, who has been our counsel in such matters since 1911.

After consultation with Mr. Carpenter, we are firmly of the belief that there should be but one recording station on each intermountain division: that this station should be equipped with proper weirs and facilities for rating and measurement of water flow; that such station should be equipped with an automatic register for official record of depth of flow; that this register and the records made by it should be open to inspection of all interested parties and all officials of both the states of Colorado and Wyoming; and that all ratings should be made at such station and reports of such ratings made at once to the state water officials.

In this matter we respectfully call your attention to the fact that we have maintained an automatic register of most approved pattern at the rating station at the east portal of the Greeley-Poudre Tunnel, from the day water was first diverted through the tunnel. This station is maintained not only for our own information but, in compliance with

the statute, for the protection of the public and of other users of water from the Cache la Poudre River. It is operated under the supervision of state water officials and the charts from the register are forewarded to the Water Commissioner. We have always invited frequent ratings of flow at the wier by officials duly authorized and with adequate experience to perform such work and such rating as a part of the official records of your office. We maintain this rating station and equipment at our own expense. It is at all times open to inspection by all interested parties and we have no objection to the State Engineer of Wyoming or his duly authorized representative, visiting the station as frequently as he may wish and making as many meter measurements as he may desire. Our records, our automatic register and all our appliances are open to your inspection and to his at any and all times.

[fol. 2676a] We do, however, respectfully protest against the establishment of any other rating station or more than one rating station on our tunnel. It is acknowledged by all authorities that the measurement of water is not an exact science and that the records obtained at no two stations would be exactly the same. When to this is added the human equation with all its prejudice, it may be readily seen that a multiplicity of rating stations can but lead to confusion and disagreement.

Our rights to divert water from the Laramie to the Poudre are fixed and determined by the decision of the Supreme Court in the case of Wyoming vs. Colorado. We expect to divert water each year to the limit fixed by that decision, as soon as our works on the Laramie River side have been put in better condition. We have no intent to violate either the spirit or the letter of the decision in that case and wish our measurements of the water flow to be so carefully checked and recorded that no question may ever arise respecting the truth of our diversions. In this matter we earnestly solicit the cooperation of your office and have no objection to your publishing to the world the facts ascertained.

We note that the request of the State Engineer of Wyoming is predicated upon proposals to enlarge diversion of water from the Laramie River for the Wheatland project in Wyoming. The expansion of the irrigated area in Wyoming upon the basis of the water supply allotted to that state in the Wyoming-Colorado decision, is a matter of

the internal affairs of that state. However, if it is now proposed to enlarge the demands upon the water supply of the Laramie River over and above the demands existing in 1922, we desire to call your attention to the fact that the Greeley-Poudre project is senior in right to any new project in Wyoming and that the limitations placed upon our project by the decision in the Wyoming-Colorado case, does not express the limit of our physical ability to divert or the original intent of our appropriations from the Laramie River, all of which is clearly expressed in the decree of the District Court of Larimer County, Colorado, adjudicating water rights in Water District 48 and if expansion is to be made in Wyoming, we suggest that it should be without prejudice to our rights.

We thank you for your courtesy in soliciting an expression of our views befor taking official action and assure you of our cooperation.

Very truly yours, The Laramie-Poudre Irrigation Co., by H. D. Parker, President.

Mr. M. C. Hinderlider, Engineering Dept., The State Capitol, Denver, Colo.

DEAR MR. HINDERLIDER:

Your letter of March 7th addressed to my father Bruce G. Eaton received. I was in your office on March 22nd but

you were out of the city. I would prefer to talk this matter over with you personally, although I do not see as there would be any serious objection from our Company in regard to checking the water measurement from Colorado into Wyoming, however I shall be in Denver next week and at that time I shall try and see you.

Very truly yours, Rex C. Eaton.

[fol. 2678] DEFENDANT'S EXHIBIT F

In the Matter of the Adjudication of the Priority of Right to the Use of Water for Irrigation in Water District No. 48, State of Colorado

Findings

The following are the findings of fact and law by the Referee upon which the decree to be reported to the Court will be based in the matter of the adjudication of the priority of right to the use of water for irrigation in Water District No. 48, State of Colorado.

Ditches

The ditches in said District are named and numbered as follows:

No. 1—The Mansfield No. 2 Ditch.
No. 2—The Hills Ditch.
No. 3—The Warren Ditch.
No. 4—The Hance Ditch.
No. 5—The Stuck Creek Ditch.
No. 6—The Jim Creek Ditch.
No. 7—The Bliler & Boswell Ditch.
No. 8—The Mansfield Ditch.
No. 9—The Yelton Ditch.
No. 10—The Martin Ditch No. 1.
No. 11—The La Garde Ditch.
No. 12—The Ward Ditch No. 1.
No. 13—The Ward Ditch No. 2.
No. 14—The Jimmy Creek Ditch.
[fol. 2679] No. 15—The Smith's Brown Ditch.
No. 16—The Trollope Creek Ditch.
No. 17—The Homestead Ditch.

No. 18—The Martin Ditch No. 2.
No. 19—The Grace Creek Ditch.
No. 20—The Brown Ditch.
No. 21—The Lamb Ditch.
No. 22—The Laramie River Ditch.
No. 23—The Comet Ditch.
No. 24—The Forrester Ditch.
No. 25—The Pache Ditch.
No. 26—The Link Ditch No. 1.
No. 27—The Lone Tree Ditch.
No. 28—The French Woman Ditch.
No. 29—The Slough Creek Ditch.
No. 30—The Link Ditch No. 2.

The findings of the referee in respect to the ownership, location, size, date and amount of the several appropriations and the amount of land irrigated, are in respect to each of the said several ditches respectively, as follows:

No. 1—The Mansfield No. 2 Ditch

The ditch is owned by N. K. Boswell, and was constructed and used to irrigate 100 acres of land. It draws its supply of water from the Big Laramie River, with headgate upon the left bank of said stream and situated in the southwest quarter of the southeast quarter of Section 1, Town 11 North, Range 77 West, North 7 degrees and 25 minutes, East 662 feet from the quarter corner to Sections 1 and 12 in said Town and Range. It is 1.5 miles long, 4 feet wide on the bottom, 5 feet wide on the top, 1.5 feet deep, with a grade of 27.72 feet per mile. Its capacity is 19.84 [fol. 2680] cubic feet of water per second of time. It is entitled to Priority No. 1, by construtcion for 19.84 cubic — of water per second, to bear date June 1, 1880.

No. 2—The Hills Ditch

The ditch is owned by Joe H. Smith and James E. Smith, and is used to irrigate 200 acres of land.

It draws its supply of water from the Big Laramie River, with headgate upon the left bank of said stream and situated in the south east quarter of the south east quarter of Section 33, Town 11 North, Range 76 West, North 53 de-

grees and 40 minutes West 1035 feet from the south east corner of said Section 33.

It is 1.75 miles long, 5 feet wide on the bottom and top, 1.5 feet deep and has a grade of 6.17 feet per mile. Its capacity is 11 cubic feet per second.

It is entitled to Priority No. 2 by construction for 11 cubic feet of water per second of time, to bear date July 1, 1880.

No. 3—The Warren Ditch

The ditch is owned by Warren Bliler, and is used to irrigate 110 acres of land.

It draws its supply of water from the Big Laramie river, with headgate upon the left bank of said stream and situated in the north east quarter of the south west quarter of Section 26, Town 12, North Range 77 West, North 37 degrees and 50 minutes West 1665 feet from the quarter corner to Sections 26 and 35 in said Town and Range.

It is three quarters of a mile long, 3 feet wide on the bottom and 4.5 feet on the top, one foot deep, with a grade of 17.6 feet per mile. Its capacity is 6.67 cubic feet per second.

[fol. 2681] It is entitled to Priority No. 3 by construction for 6.67 cubic feet of water per second, to bear date March 25, 1881.

No. 4—The Hance Ditch

The ditch is owned by Charles A. Martin, and was constructed and is used to irrigate 200 acres of land.

It draws its supply of water from Grace Creek, a tributary of the Big Laramie River, with headgate upon the left bank of said stream and situated in the north west quarter of the north east quarter of Section 2, Town 11 North, Range 77 West, South 30 degrees 15 minutes East 1006 feet from the quarter corner to Sections 2 and 35 in Towns 11 and 12 North, Range 77 West.

It is 1.75 miles long, 6 feet wide on the bottom and top, 1.5 feet deep and has a grade of 12.14 feet per mile. Its capacity is 19.44 cubic feet per second.

It is entitled to Priority No. 4 by construction, for 19.44 cubic feet of water per second, to bear date March 31, 1881.

No. 5—The Stuck Creek Ditch

The ditch is owned by Warren Bliler and was constructed and is used to irrigate 165 acres of land.

It draws its supply of water from the Stuck Creek, a tributary of the Big Laramie river, with headgate upon the *left bank of said stream and situated in the south east quarter* of the south east quarter of Section 22, Town 12, North, Range 77 West, North 25 degrees and 50 minutes West 102 feet from the south east corner of said Section 22.

It is one half mile long, 2.5 feet wide on the bottom and 4 feet on top, 2 feet deep and has a grade of 17.52 feet per mile. Its capacity is 16.12 cubic feet per second.

[fol. 2682] It is entitled to Priority No. 5, by construction, for 16.12 cubic feet of water per second, to bear date April 1, 1881.

No. 6—The Jim Creek Ditch

The ditch is owned by James B. Arthur, and was constructed and is used to irrigate 160 acres of land.

It draws its supply of water from Jimmy Creek, a tributary of the Big Laramie river, with headgate upon the right bank of said stream and situated in the south west quarter of Section 36, Town 11 North, Range 76 West, North 31 degrees East 1875 feet from the corner to Sections 1, 2, 35 and 36, Towns 10 and 11 North, Range 76 West.

It is three fourths of a mile long, 4 feet wide on the bottom, 1.25 feet deep and has a grade of 5 feet per mile. Its capacity is 9 cubic feet per second.

It is entitled to Priority No. 6 by construction, for 9 cubic feet per second of time to bear date July 10, 1881.

No. 7—The Bliler & Boswell Ditch

The ditch is owned by Warren Bliler and N. K. Boswell, and was constructed and is used to irrigate 225 acres of land in Colorado and 300 acres in Wyoming.

It draws its supply of water from the Big Laramie river, with headgate upon the right bank of said stream in the north west quarter of the north east quarter of Section 35, Town 12, North, Range 77 West, South 23 degrees 40 minutes East 1002 feet from the quarter corner to Sections 26 and 35 in said Town and Range.

It is 4 miles long, 4.5 feet wide on the bottom. 6.5 feet on top, 1.8 feet deep and has a grade of 7.18 feet per mile. Its capacity is 16.43 cubic feet per second.

It is entitled to Priority No. 7, by construction, for 16.43 cubic feet of water per second, to bear date April 1, 1882.

[fol. 2683] No. 8—The Mansfield Ditch

The ditch is owned by N. K. Boswell and C. A. Martin, and was constructed and is used to irrigate 320 acres of land.

It draws its supply of water from the Big Laramie river, with headgate upon the right bank of said stream and situated in the south east quarter of the north east quarter of Section 12, Town 11 North, Range 77 West, South 3 degrees 45 minutes West 1698 feet from the north east corner of said section 12.

It is 3 miles long, 6 feet wide on the bottom, 8 feet on top, 1.5 feet deep, and has a grade of 4.8 feet per mile. Its capacity is 11.61 cubic feet per second.

It is entitled to Priority No. 8, by construction, for 11.61 cubic feet per second, to bear date April 20, 1882.

No. 9—The Yelton Ditch

The ditch is owned by Daniel Johnson, Coe & Carter and Joe H. Smith, and is used to irrigate 250 acres of land.

It draws its supply of water from the Big Laramie river with headgate upon the left bank of said stream and situated in the south west quarter of the north east quarter of Section 29, Town 11 North, Range 76 West, South 21 degrees 45 minutes East 2275 feet from the quarter corner to Sections 20 and 29 Town 11 North, Range 76 West.

It is 2.25 miles long, 5 feet wide on the bottom and top, 2.2 feet deep and has a grade of 21.43 feet per mile. Its capacity is 30.14 cubic feet per second.

It is entitled to Priority No. 9 by construction, for 30.14 cubic feet of water per second, to bear date July 1, 1882.

No. 10—The Martin Ditch No. 1

The ditch is owned by F. W. Sherwood, and was constructed and is used to irrigate 640 acres of land.

It draws its supply of water from the Big Laramie river, [fol. 2684] with headgate upon the right bank of said

stream, and situated in the north west quarter of the south east quarter of Section 15, Town 10 North, Range 76 West, South 26 degrees 45 minutes West 3282 feet from the north east corner of said Section 15.

It is 2.75 miles long, 6 feet wide on the bottom and 8 feet on top, 1.5 feet deep and has a grade of 6 feet per mile. Its capacity is 15.5 cubic feet per second.

It is entitled to Priority No. 10 by construction, for 15.5 cubic feet of water per second, to bear date April 20, 1883.

No. 11—The La Garde Ditch

The ditch is owned by Daniel Johnson, Tamerlane Forrester and J. H. Detro, and was constructed and is used to irrigate 150 acres of land.

It draws its supply of water from the left bank of La Garde Creek, a tributary of the Big Laramie river, with headgate siutated in the north west quarter of the north west quarter of Section 20, Town 11 North, Range 76 West, South 86 degrees 30 minutes East 616 feet from the north west corner of said Section 20.

It is 1.75 miles long, 3.5 feet wide on the bottom and 5.5 feet wide on top, 1.5 feet deep and has a grade of 14.10 feet per mile. Its capacity is 10.33 cubic feet per second.

It is entitled to Priority No. 11, by construction, for 10.33 cubic feet of water per second, to bear date June 10, 1883.

No. 12—The Ward Ditch No. 1

The ditch is owned by John L. Dagle and James B. Arthur, and was constructed and is used to irrigate 80 acres of land.

It draws its supply of water from Jimmy Creek, a tributary of the Big Laramie river, with headgate upon the right bank of said stream and situated in the south east [fol. 2685] quarter of the southeast quarter of Section 27, Town 11 North, Range 76 West, North no degrees and 20 minutes West 785 feet from the south west corner of Section 26, Town and Range aforesaid.

It is three fourths of a mile long, 4 feet wide on the bottom and 5 feet on top, 1 foot deep and has a grade of 8.97 feet per mile. Its capacity is 4.25 feet per second.

It is entitled to Priority No. 12, by construction, for 4.25 cubic feet of water per second, to bear date June 15, 1883.

No. 13—The Ward Ditch No. 2

The ditch is owned by John L. Dagle, and was constructed and used to irrigate 50 acres of land.

It draws its supply of water from Jimmy Creek, a tributary of the Big Laramie river, with headgate upon the left bank of said stream and situated in the south west quarter of the south west quarter of Section 26, Town 11 North, Range 76 West, North 6 degrees 45 minutes East 326 feet from the south east corner of Section 27 in said Town and Range.

It is 1 mile long, 4 feet wide, 1 foot deep, and has a grade of 53.48 feet per mile. Its capacity is 9.48 cubic feet per second.

It is entitled to Priority No. 13, by construction, for 9.48 cubic feet of water per second, to bear date July 1, 1883.

No. 14—The Jimmy Creek Ditch

The ditch is owned by Daniel Johnson and Coe & Carter, and was constructed and is used to irrigate 200 acres of land.

It draws its supply of water from Jimmy Creek and from the Big Laramie river, with its upper headgate upon the right bank of said Big Laramie river in the south east quarter of Section 20, Town 11 North, Range 76 West and with its Jimmy Creek crossing or headgate in the south [fol. 2686] east quarter of Section 17 of said Town and Range.

It is 1.75 miles long, 4.3 feet wide on the bottom, 5.3 feet wide on top, 1 foot deep and has a grade of 13.20 feet per mile. Its capacity is 5.52 cubic feet per second.

It is entitled to Priority No. 14, by construction, for 5.52 cubic feet of water per second from Jimmy Creek, to bear date June 1, 1884, and also to Priority No. 22, by extension of the Big Laramie river, for 5.52 cubic feet of water from said river when the amount cannot be obtained from Jimmy Creek, to bear date May 1, 1891.

No. 15—The Smiths' Brown Ditch

The ditch is owned by Joe H. Smith and James E. Smith, and was constructed and is used to irrigate 160 acres of land.

It draws its supply of water from the Big Laramie river with two headgates, one South 25 degrees 50 minutes East 3146 feet, and the other South 2 degrees 50 minutes East 1358 feet from the north east corner of Section 32, Town 11 North, Range 76 West.

It is 2.5 miles long, 6 feet wide on the bottom, 7 feet on top, 1.2 feet deep, and has a grade of 14.25 feet per mile. Its capacity is 16.53 cubic feet per second.

It is entitled to Priority No. 15, by construction, for 16.53 cubic feet of water per second, to bear date, June 10, 1884.

No. 16—The Trollope Creek Ditch

The ditch is owned by John L. Dagle, and was constructed and is used to irrigate 80 acres of land.

It draws its supply of water from Trollope Creek, a tributary of Jimmy Creek, a tributary of the Big Laramie river, with headgate upon the right bank of said Trollope Creek in the south west quarter of the south west quarter of Section 23, Town 11 North, Range 76 West.

[fol. 2687] It is one half mile long, 4 feet wide on the bottom, 5 feet on top, 1.5 feet deep and has a grade of 42.24 feet per mile. Its capacity is 17.75 cubic feet per second.

It is entitled to Priority No. 16, by construction, for 6.89 cubic feet of water per second, to bear date June 15, 1884. Also to Priority No. 30, by enlargement of the ditch, for 10.86 cubic feet of water per second, to bear date May 29, 1896.

No. 17—The Homestead Ditch

The ditch is owned by Victor G. H. Stuart and Alexander Stuart, and was constructed and is used to irrigate 100 acres of land.

It draws its supply of water from a branch of the McIntyre Creek, which is a tributary of the Big Laramie river, with headgate upon the left bank of said branch and situated in the north east quarter of the south east quarter

of Section 6, Town 10 North, Range 76 West, North 24 degrees, 50 minutes West 1800 feet from the south east corner of said Section 6.

It is three fourths of a mile long, 2 feet wide on the bottom, 3 feet on top, 1.5 feet deep and has a grade of 54.90 feet per mile. Its capacity is 9 cubic feet per second of time.

It is entitled to Priority No. 17, by construction, for 9 cubic feet of water per second, to bear date July 10, 1884.

No. 18—The Martin Ditch No. 2

The ditch is owned by F. W. Sherwood, and was constructed and is used to irrigate 640 acres of land.

It draws its supply of water from the Big Laramie river, with headgate upon the south west quarter of the north east quarter of Section 10, Town 10 North, Range 76 West, South 4 degrees 35 minutes East 1920 feet from the quarter corner to Sections 3 and 10 in said Town and Range.

[fol. 2688] Its length is three fourths of a mile. It is 6 feet wide on the bottom, 8 feet on top, 1.5 feet deep, and has a grade of 5.28 feet per mile. Its capacity is 14.5 cubic feet per second.

It is entitled to Priority No. 18, by construction, for 14.5 cubic feet of water per second, to bear date April 30, 1887.

No. 19—The Grace Creek Ditch

The ditch is owned by Laona E. Hance, and was constructed and is used to irrigate 80 acres of land.

It draws its supply of water from Grace Creek, a tributary of the Big Laramie river, with headgate upon the left bank of said stream and situated in the north west quarter of the north west quarter of Section 14, Town 11 North, Range 77 West, South 37 degrees 45 minutes East 574 feet from the north west corner of said Section 14.

It is 2.25 miles long, 3 feet wide on the bottom, 4 feet on top, 1 foot deep and has a grade of 8.97 feet per mile. Its capacity is 3.07 cubic feet per second.

It is entitled to Priority No. 19, by construction, for 3.07 cubic feet of water per second of time, to bear date April 1, 1888.

No. 20—The Brown Ditch

The ditch is owned by C. C. Forrester, and was constructed and is used to irrigate 100 acres of land.

It draws its supply of water from Nunn Creek, a tributary of the Big Laramie river, with headgate upon the right bank of said stream and situated in the north west quarter of the north west quarter of Section 36, Town 10 North, Range 76 West, about 900 feet south easterly from the north west corner of said Section 36.

[fol. 2689] It is three-fourths of a mile long, 5 feet wide, 2 feet deep and has a grade of six and two-thirds feet per mile. Its capacity is 10 cubic feet per second.

It is entitled to Priority No. 20, by construction, for 10 cubic feet of water per second, to bear date May 31, 1890.

No. 21—The Lamb Ditch

The ditch is owned by Clara N. Smith, and was constructed and is used to irrigate 160 acres of land.

It draws its supply of water from McIntyre Creek, a tributary of the Big Laramie river, with headgate upon the right bank of said stream and situated North 15 degrees 45 minutes East 2196 feet from the south west corner of Section 5, Town 10, North Range 76 West.

It is 1.25 miles long, 4 feet wide on the bottom, 5 feet on top, 1 foot deep, and has a grade of 5 feet per mile. Its capacity is 3.88 cubic feet per second.

It is entitled to Priority No. 21, by construction, for 3.88 cubic feet of water per second to bear date June 1, 1890.

No. 22—The Laramie River Ditch

The ditch is owned by The Water Supply & Storage Company, and was constructed and is used to irrigate 30,000 acres of land and for the filling of reservoirs.

Its headgate is located upon the right bank of the West branch of the Big Laramie River, at a point from which the quarter corner of Sections 11 and 14, Town 8 North, Range 76 West, bears North 10 degrees 16 minutes East 2817 feet. The ditch is smallest at is headgate and upper end, where it draws its chief supply of water from the West branch of the Big Laramie river, and it increases in size and capacity from the headgate down to its lower end at Chambers Lake

and intercepts and appropriates the waters of Two and a [fol. 2690] Half Mile Creek, Three Quarter Mile Creek, Half Mile Creek and other small branches crossing the line of the ditch between its headgate and its mouth. The capacity of the ditch at the headgate is 242 cubic feet per second, and it increases from this point towards the lower end of the ditch to a capacity of 400 cubic feet per second. It appropriates 242 cubic feet of water at its headgate from said West branch and appropriates all the waters of the streams intercepting the line of the ditch and crossing the same, up to a total of 400 cubic feet of water per second of time.

The ditch is 5 miles long, 12 feet wide on the bottom, 18 feet wide at the top, 5.5 feet deep, and its grade is 15.84 feet per mile at the lower end, 5.28 feet per mile through the middle, and 10 feet per mile at the headgate.

The ditch is entitled to Priority No. 23 by construction, of 242 cubic feet of water per second at the headgate, and 158 cubic feet per second from tributaries crossing the line of the ditch, being a total appropriation of 400 cubic feet of water per second of time, all of which bears date from the 7th day of August A. D. 1891.

No. 23—The Comet Ditch

The ditch is owned by Victor G. H. Stuart, and was constructed and is used to irrigate 280 acres of land.

It draws its supply of water from McIntyre Creek, a tributary of the Big Laramie river, with headgate upon the left bank of said stream in the north west quarter of the north east quarter of Section 17, Town 10, Range 76 West, South 14 degrees 45 minutes East 1288 feet from the quarter corner to Sections 8 and 17 in said Town and Range.

It is 9,190 feet long, 5 feet wide on the bottom, 7 feet at [fol. 2691] the top, 1 foot deep, and has a grade of 7.12 feet per mile. Its capacity is 7.4 cubic feet per second.

It is entitled to Priority No. 24, by construction, for 7.4 cubic feet of water per second, to bear date December 7, 1892.

No. 24—The Forrester Ditch

The ditch is owned by C. C. Forrester, and was constructed and is used to irrigate 80 acres of land.

It draws its supply of water from Brown Creek, a tributary of the Big Laramie river, with headgate upon the right bank of said stream in the north west quarter of Section 25, Town 10 North, Range 76 West.

It is three fourths of a mile long, 4 feet wide, 1.5 feet deep, and has a grade of six and two thirds feet per mile. Its capacity is 7 cubic feet per second.

It is entitled to Priority No. 25, by construction, for 7 cubic feet of water per second of time, to bear date May 15, 1893.

No. 25—The Pache Ditch

The ditch is owned by August Pache, and was constructed and is used to irrigate 220 acres of land.

It draws its supply of water from La Garde Creek, a tributary of the Big Laramie river, with headgate upon the right bank of said stream, and situated in the north east quarter of the north west quarter of Section 31, Town 11 North, Range 76 West, South 61 degrees West 1118 feet from the quarter corner to Sections 30 and 31 in said Town and Range.

It is 1.25 miles long, 4 feet wide, 1.2 feet deep and has a grade of 57.55 feet per mile. Its capacity is 18.14 cubic feet per second.

It is entitled to Priority No. 26, by construction, for 18.14 [fol. 2692] cubic feet of water per second, to bear date May 25, 1893.

No. 26—The Link Ditch No. 1

The ditch is owned by Mary E. Link, and was constructed and is used to irrigate 200 acres of land.

It draws its supply of water from the Big Laramie river, with headgate upon the right bank of said stream and situated in the south east quarter of the north east quarter of Section 11, Town 9 North, Range 76 West, about 660 feet North of the center line of said Section 11.

It is 1.75 miles long, 6 feet wide on the bottom, 7 feet on top, 18 inches deep and has a grade of 5 feet per mile. Its capacity is 14.22 cubic feet per second.

It is entitled to Priority No. 27, by construction, for 14.22 cubic feet of water per second, to bear date June 1, 1894.

No. 27—The Lone Tree Ditch

The ditch is owned by F. W. Sherwood, and was constructed and is used to irrigate 200 acres of land.

It draws its supply of water from Lone Tree Creek, a tributary of the Big Laramie river, with headgate upon the right bank of said stream and situated in the south west quarter of Section 11, Town 10 North, Range 76 West, South 51 degrees 10 minutes East 2108 feet from the quarter corner to Section 10 and 11 in said Town and Range.

It is one half mile long, 6 feet wide on the bottom, 8 feet on the top, 1.5 feet deep and has a grade of 15.84 feet per mile. Its capacity is 25 feet per second of time.

It is entitled to Priority No. 28, by construction, for 25 cubic feet of water per second, to bear date October 24, 1894.

No. 28—The French Woman Ditch

The ditch is only in process of building, and is not en- [fol. 2693] titled to an absolute decree at this time. It is owned by John L. Dagle and is intended to be used to irrigate 120 acres of land.

Its headgate is upon the left bank of the French Woman Creek a tributary of Jimmy Creek, which is tributary to the Big Laramie river, and is situated in the north east quarter of the north west quarter of Section 22, Town 11 North, Range 76, West, North 33 degrees 55 minutes West 6310 feet from the south east corner of said Section 22.

Its proposed length is 1.25 miles, width, 4 feet on the bottom and 5 feet on top, depth, 1 foot, and grade 26.40 feet per mile. Its proposed capacity is 7.56 cubic feet per second.

If the ditch shall be completed and the water actually appropriated and applied to irrigation within a reasonable time from the commencement of the work thereon, according to the nature of the work of constructing said ditch and in accordance with the plan thereof heretofore given in evidence, the said ditch will be entitled to Priority No. 29, by construction, for 7.56 cubic feet of water per second to bear date May 28, 1896.

No. 29—The Slough Creek Ditch

The ditch is owned by Charles A. Martin and is used and was constructed to irrigate 35 acres of land.

Its draws its supply of water from Slough Creek, a tributary of Grace Creek, which is a tributary of the Big Laramie river, with headgate upon the left bank of said stream and situated in the north west quarter of the south west quarter of Section 2, Town 11 North, Range 77 West, South 14 degrees 5 minutes East 465 feet from the quarter corner to Sections 2 and 3 in said Town and Range.

It is three fourths of a mile long, 3 feet wide on the bottom, 4 feet on top, 1.5 feet deep, and has a grade of 5.28 [fol. 2694] feet per mile. Its capacity is 4.11 cubic feet per second of time.

It is entitled to Priority No. 31, by construction, for 4.11 cubic feet of water per second, to bear date May 30, 1896.

No. 30—The Link Ditch No. 2

The ditch is owned by Wallis A. Link, and was constructed and is used to irrigate 50 acres of land.

It draws its supply of water from a branch of the Big Laramie river, with headgate in the north east quarter of the north west quarter of Section 2, Town 9 North, Range 76 West.

It is three fourths of a mile long, 3 feet wide on the bottom, 3.5 feet on top, 8 inches deep, and has a grade of 5 feet per mile. Its capacity is 2 cubic feet per second.

It is entitled to Priority No. 32, by appropriation, for 2 cubic feet per second of time, to bear date from the 15th day of June A. D. 1896.

Reservoirs

Priority No. 1

Reservoir Nos. 1, 2, 3, 4, and 5 and Chambers Lake, belonging to the Water Supply & Storage Company.

The Water Supply & Storage Company is the owner of Reservoirs Nos. 1, 2, 3, 4, and 5 and Chambers Lake. They are storage reservoirs of water to be used for irrigation, and have jointly a storage capacity of 500,000,000 cubic feet. Water has been stored therein taken from the Laramie river and its tributaries by means of the Laramie River Ditch, during the seasons of 1894, 1895 and 1896, when not needed for immediate use for irrigation. The storage right runs concurrent with the date of the construction of said

the Laramie River Ditch. The said The Water Supply & Storage Company is entitled to Reservoir Priority No. 1 of [fol. 2695] this Water District, for all its said reservoirs jointly, viz. Nos. 1, 2, 3, 4, and 5 and Chambers Lake, by appropriation of water and construction of the Laramie River Ditch, to the amount of 500,000,000 cubic feet annually, which priority bears date the 7th day of August, A. D. 1891.

The above and foregoing findings upon the thirty ditches and the six reservoirs of The Water Supply & Storage Company concerning which testimony has been offered in this matter, and upon which the decree is based, constitute all the special findings of the referee in this proceeding.

(Signed) Jno. C. Hanna, Referee.

[fol. 2696] IN THE DISTRICT COURT

STATE OF COLORADO,
County of Larimer, ss:

In the Matter of the Adjudication of the Priority of Right to the Use of Water for Irrigation in Water District No. 48, State of Colorado.

DECREE

Now on this 30th day of October, A. D. 1896, this matter coming on for final hearing and adjudication upon the report of John C. Hanna, referee appointed herein, to whom this matter was, by order of this Court, herein entered on the 14th day of September, A. D. 1895, referred for the purposes in said order mentioned, as well upon the several findings upon the evidence produced in this matter, as upon the said evidence taken by and before the said referee, and the Court being satisfied, from the several returns of notices, certificates of publication, affidavits and certificates of the said referee, respectively, that the said testimony returned, and upon which the findings herein returned have severally been made, was taken upon due and lawful notice, in all respects according to the provisions of the statute in such case made and provided and the rules and several orders of the Court in that behalf in this matter made and entered; and further, that the notice of the time set for filing exceptions in this matter to said report

and findings, and of the time set for the final hearing thereof and of this cause, have been duly served on all the parties entitled to notice under the order of this Court in that behalf entered, in manner and form as by the said order re-
[fol. 2697] quired; and further, that all interested in this matter and entitled to notice in any stage of the proceedings therein, have at all times been duly notified according to law and the order of this Court; and the report of the said referee, together with the returns of service of notices, affidavits, abstract and findings, being found in due form, and the Court having now here in open Court heard all parties and their attorneys so far as they desired to be heard, respectively, touching the several matters herein, it is by the Court, in consideration of all the premises, hereby ordered and adjudged that the several findings of the said referee, as reported to and filed in this Court, be in all things approved and confirmed, and that they be taken, deemed and held in all respects as the findings of this Court in this matter; and further, it is upon like consideration by the Court here ordered, adjudged and decreed in respect to all and singular the said findings of the said referee, in respect to each ditch, canal and reservoir in said findings numbered 1 to 30 inclusive as found in that certain book numbered III, and marked "Referee's Findings", and as the same are hereinafter mentioned and designated in separate paragraphs hereof, as hereinafter in said several paragraphs severally set forth; subject, however, to the following next mentioned provisions, to-wit:

1. No part of this decree shall in any case be taken, deemed or held to confirm, impair or in any manner affect any claim of right or property held or claimed by any person, association or corporation in or to any ditch, canal or reservoir, or any part thereof, or the land or any part thereof on which any such ditch, canal or reservoir may be situated, or the land held or claimed as right of way of any of them, or any right, interest or claim of property whatever, in or relating to any of them.

[fol. 2698] 2. No part of this decree shall be taken, deemed or held as affecting in any manner any question or claim of right between the owners or claimants of any such ditch, canal or reservoir, as between each other, whether as part owners or shareholders therein, or as stockholders in any

corporation or joint stock company claiming or to claim the same or any part thereof, nor shall it affect the rights, interests or claims of any consumers of water for irrigation or domestic purposes, whether as part owner, lessee, shareholder or stockholder in any corporation holding or controlling the same, or as purchaser of water therefrom, as against the rights, interest, or claims of any other party or parties interested, or claiming interest or rights in or to such ditch, canal or reservoir as owner, lessee or part owner thereof, or as shareholder or stockholder in any corporation claiming the same or as purchaser of water therefrom. Neither shall it affect any claim of priority made or resisted as between parties using water for said purposes from the same ditch, canal or reservoir, as to such water.

3. No part of this decree shall in any manner affect any question between two or more parties claiming or owning priorities as herein adjudged, on the same stream, in any case where the water in such stream sinks and rises to the surface again between the locations of the headgates of their respective ditches or canals, or in any dispute as to the identity of the water appropriated by either party out of such sinking and rising stream.

4. This decree shall not affect any question of priority between claimants or owners of ditches or canals used in whole or in part for milling or manufacturing or water power for other purposes as to any water carried in such ditches or canals for said purposes.

5. This decree shall not affect any claim, interest or [fol. 2699] right of any corporation as the right of property in any ditch, canal or reservoir, or the ground on which the same may be situated, or any question which may arise between the stockholders thereof or between them and the State, people or any party, upon the dissolution of such corporation by expiration of its charter or otherwise, as to any appropriation of water or rights secured by condemnation proceeding by such corporation during its legal existence.

6. No part of this decree shall affect in any way any right, claim or interest now or hereafter held or claimed to any appropriation of water made after the closing of testimony touching the construction or enlargements of

the ditch, canal or reservoir by means of which such appropriation may have been made.

7. No part of this decree shall be taken, deemed or held as adjudging to any claimant or present or future representative of any claim to any ditch or canal or reservoir, or party holding, using or controlling the same, any right to take and carry by means of any ditch, canal or reservoir herein mentioned, or by virtue of any appropriation herein adjudged, any water from any natural stream except to be applied to the use for which such appropriation has been made; nor to allow any excessive use or waste of water whatever; nor to allow any diversion of water except for lawful and beneficial uses.

8. This decree shall be taken, deemed and held as intended to determine and establish the several priorities of right by appropriation of water from the streams of said Water District No. 48, for irrigation, of the several ditches, canals and reservoirs in said district, concerning which testimony has been offered in this matter, each according to the construction, enlargement or extension thereof, with the amount of water held to have been appropriated thereby.

[fol. 2700] Subject to the several last mentioned eight provisions it is further, as to said ditches, canals and reservoirs, and the several appropriations of water by means of them respectively claimed in this matter, ordered, adjudged and decreed, as in and by the findings of said referee is found, as follows:

That said ditches be and the same are hereby numbered according to the date of their several and respective constructions, and said dates are hereby determined and declared to be as follows:

No. 1—The Mansfield No. 2 Ditch ..... June 1, 1880
No. 2—The Hills Ditch ..... July 1, 1880
No. 3—The Warren Ditch ..... March 25, 1881
No. 4—The Hance Ditch ..... March 31, 1881
No. 5—The Stuck Creek Ditch ..... April 1, 1881
No. 6—The Jim Creek Ditch ..... July 10, 1881
No. 7—The Bliler and Boswell Ditch ..... April 1, 1882

No. 8—The Mansfield Ditch ..... April 20, 1882
No. 9—The Yelton Ditch ..... July 1, 1882
No. 10—The Martin Ditch No. 1 ..... April 20, 1883
No. 11—The La Garde Ditch ..... June 10, 1883
No. 12—The Ward Ditch No. 1 ..... June 15, 1883
No. 13—The Ward Ditch No. 2 ..... July 1, 1883
No. 14—The Jimmy Creek Ditch ..... June 1, 1884
No. 15—The Smiths' Brown Ditch ..... June 10, 1884
No. 16—The Trollope Creek Ditch ..... June 15, 1884
No. 17—The Homestead Ditch ..... July 10, 1884
No. 18—The Martin Ditch No. 2 ..... April 30, 1887
No. 19—The Grace Creek Ditch ..... April 1, 1888
No. 20—The Brown Ditch ..... May 31, 1890
No. 21—The Lamb Ditch ..... June 1, 1890
No. 22—The Laramie River Ditch ..... August 7, 1891

[fol. 2701]

No. 23—The Comet Ditch ..... December 7, 1892
No. 24—The Forrester Ditch ..... May 15, 1893
No. 25—The Pache Ditch ..... May 25, 1893
No. 26—The Link Ditch No. 1 ..... June 1, 1894
No. 27—The Lone Tree Ditch ..... October 24, 1894
No. 28—The French Woman Ditch (conditioned) ..... May 28, 1896
No. 29—The Slough Creek Ditch ..... May 30, 1896
No. 30—The Link Ditch No. 2 ..... June 15, 1896

And the several appropriations of water for said ditches and their respective enlargements and extensions are hereby numbered and declared, with the dates of said appropriations, to be as follows:

No. 1—The Mansfield No. 2 Ditch, original construction, June 1, 1880
No. 2—The Hills Ditch, original construction, July 1, 1880
No. 3—The Warren Ditch, original construction, March 25, 1881
No. 4—The Hance Ditch, original construction, March 31, 1881
No. 5—The Stuck Creek Ditch, original construction, April 1, 1881
No. 6—The Jim Creek Ditch, original construction, July 10, 1881

No. 7—The Bliler & Boswell Ditch, original construction, April 1, 1882

No. 8.—The Mansfield Ditch, original construction, April 20, 1882

No. 9—The Yelton Ditch, original construction, July 1, 1882

No. 10—The Martin Ditch No. 1, original construction, April 20, 1883

No. 11—The LaGarde Ditch, original construction, June 10, 1883

No. 12—The Ward Ditch No. 1, original construction, June 15, 1883

No. 13—The Ward Ditch No. 2, original construction, July 1, 1883

No. 14—The Jimmy Creek Ditch, original construction, June 1, 1884

No. 15—The Smiths' Brown Ditch, original construction, June 10, 1884

No. 16—The Trollope Creek Ditch, original construction, June 15, 1884

[fol. 2702]

No. 17—The Homestead Ditch, original construction, July 10, 1884

No. 18—The Martin Ditch No. 2, original construction, April 30, 1887

No. 19—The Grace Creek Ditch, original construction, April 1, 1888

No. 20—The Brown Ditch, original construction, May 31, 1890

No. 21—The Lamb Ditch, original construction, June 1, 1890

No. 22—The Jimmy Creek Ditch, extension to river, May 1, 1891

No. 23—The Laramie River Ditch, original construction, Aug. 7, 1891

No. 24—The Comet Ditch, original construction, Dec. 7, 1892

No. 25—The Forrester Ditch, original construction, May 15, 1893

No. 26—The Pache Ditch, original construction, May 25, 1893

No. 27—The Link Ditch No. 1, original construction, June 1, 1894

No. 28—The Lone Tree Ditch, original construction, Oct. 24, 1894
No. 29—The French Woman Ditch, original construction, conditioned, May 28, 1896
No. 30—The Trollope Creek Ditch, enlargement, May 29, 1896
No. 31—The Slough Creek Ditch, original construction, May 30, 1896.
No. 32—The Link Ditch No. 2, original construction, June 15, 1896

And said ditches are entitled to said appropriations and priorities on the aforesaid numbers as follows:

No. 1—The Mansfield No. 2 Ditch,
Priority No. 1 ..... June 1, 1880
No. 2—The Hills Ditch,
Priority No. 2 ..... July 1, 1880
No. 3—The Warren Ditch,
Priority No. 3 ..... March 25, 1881
No. 4—The Hance Ditch,
Priority No. 4 ..... March 31, 1881
No. 5—The Stuck Creek Ditch,
Priority No. 5 ..... April 1, 1881
No. 6—The Jim Creek Ditch,
Priority No. 6 ..... July 10, 1881
No. 7—The Bliler and Boswell Ditch,
Priority No. 7 ..... April 1, 1882
No. 8—The Mansfield Ditch,
Priority No. 8 ..... April 20, 1882
No. 9—The Yelton Ditch,
Priority No. 9 ..... July 1, 1882
[fol. 2703] No. 10—The Martin Ditch No. 1,
Priority No. 10 ..... April 20, 1833
No. 11—The La Garde Ditch,
Priority No. 11 ..... June 10, 1883
No. 12—The Ward Ditch No. 1,
Priority No. 12 ..... June 15, 1883
No. 13—The Ward Ditch No. 2,
Priority No. 13 ..... July 1, 1883
No. 14—The Jimmy Creek Ditch,
Priority No. 14 ..... June 1, 1884
Priority No. 22 ..... May 1, 1891
No. 15—The Smiths' Brown Ditch,
Priority No. 15 ..... June 10, 1884

No. 16—The Trollope Creek Ditch,
Priority No. 16 ..... June 15, 1884
Priority No. 30 ..... May 29, 1896
No. 17—The Homestead Ditch,
Priority No. 17 ..... July 10, 1884
No. 18—The Martin Ditch No. 2,
Priority No. 18 ..... April 30, 1887
No. 19—The Grace Creek Ditch,
Priority No. 19 ..... April 1, 1888
No. 20—The Brown Ditch,
Priority No. 20 ..... May 31, 1890
No. 21—The Lamb Ditch,
Priority No. 21 ..... June 1, 1890
No. 22—The Laramie River Ditch,
Priority No. 23 ..... Aug. 7, 1891
No. 23—The Comet Ditch,
Priority No. 24 ..... Dec. 7, 1892
No. 24—The Forrester Ditch,
Priority No. 25 ..... May 15, 1893
No. 25—The Pache Ditch,
Priority No. 26 ..... May 25, 1893
No. 26—The Link Ditch No. 1,
Priority No. 27 ..... June 1, 1894
No. 27—The Lone Tree Ditch,
Priority No. 28 ..... Oct. 24, 1894
No. 28—The French Woman Ditch,
Priority No. 29 (conditioned) ..... May 28, 1896
[fol. 2704] No. 29—The Slough Creek Ditch,
Priority No. 31 ..... May 30, 1896
No. 30—The Link Ditch No. 2,
Priority No. 32 ..... June 15, 1896

And more particularly in regard to the said several ditches, canals and reservoirs, respectively, as follows:

No. 1—The Mansfield No. 2 Ditch

That ditch numbered One, named the Mansfield No. 2 Ditch, N. K. Boswell, claimant, is a ditch constructed and used for the irrigation of one hundred acres of land; it draws its water supply from the Big Laramie river, with headgate upon the left bank of said stream and situated in the southwest quarter of the southeast quarter of sec-

tion 1, Town 11 North, Range 77 West, North 7 degrees and 25 minutes East 662 feet from the quarter corner to Sections 1 and 12 in said Town and Range, and entitled by appropriation to use of water from said stream to Priority Number One by construction thereof, and thereby to the quantity of water with the number and date of the priority of the appropriation thereof, hereinafter mentioned, for the use aforesaid and for the benefit of the party or parties lawfully entitled thereto; it is hereby adjudged and decreed that there be allowed to flow into said ditch from said stream for the use and benefit aforesaid under and by virtue of said appropriation by construction, Priority Number One, nineteen and eighty-four hundredths cubic feet of water per second of time, or so much thereof as may be necessary to irrigate one hundred acres of land, the [fol. 2705] appropriation of which water took effect on, and said priority dates from the first day of June, A. D. 1880.

No. 2—The Hills Ditch

That ditch numbered Two, named the Hills Ditch, Joe H. Smith and James E. Smith, claimants, is a ditch constructed and used for the irrigation of two hundred acres of land; it draws its supply of water from the Big Laramie river, with headgate upon the left bank of said stream and situated in the southeast quarter of the southeast quarter of Section 33, Town 11 North, Range 76 West, North 53 degrees and 40 minutes West 1035 feet from the southeast corner of said section 33, and entitled by appropriation to use of water from said stream to Priority Number Two, by construction thereof, and thereby to the quantity of water with the number and date of the priority of the appropriation thereof, hereinafter mentioned, for the use aforesaid and for the benefit of the party or parties lawfully entitled thereto; it is hereby adjudged and decreed that there be allowed to flow into said ditch from said stream, for the use and benefit aforesaid, under and by virtue of said appropriation by construction, Priority Number Two, eleven cubic feet of water per second of time, or so much thereof as may be necessary to irrigate two hundred acres of land, the appropriation of which water took effect on, and said priority dates from the first day of July, A. D. 1880.

No. 3—The Warren Ditch

That ditch numbered Three, named the Warren Ditch, Warren Bliler, claimant, is a ditch constructed and used for the irrigation of one hundred and ten acres of land; it draws its supply of water from the Big Laramie river, with headgate upon the left bank of said stream and situated in the northeast quarter of the southwest quarter of Section 26, Town 12 North, Range 77 West, North 37 de- [fol. 2706] grees and 50 minutes West 1665 feet from the quarter corner to Sections 26 and 35 in said Town and Range, and entitled by appropriations to use of water from said stream to Priority Number Three, by construction thereof, and thereby to the quantity of water with the number and date of the priority of the appropriation thereof, hereinafter mentioned, for the use aforesaid and for the benefit of the party or parties lawfully entitled thereto; it is hereby adjudged and decreed that there be allowed to flow into said ditch from said stream, for the use and benefit aforesaid, under and by virtue of said appropriation by construction, Priority Number Three, six and sixty-seven hundredths cubic feet of water per second of time, or so much thereof as may be necessary to irrigate one hundred and ten acres of land, the appropriation of which water took effect on, and said priority dates from the 25th day of March, A. D. 1881.

No. 4—The Hance Ditch

That ditch numbered Four, named the Hance Ditch, Charles A. Martin, claimant, is a ditch constructed and used for the irrigation of two hundred acres of land; it draws its supply of water from Grace Creek, a tributary of the Big Laramie river, with headgate upon the left bank of said stream and situated in the northwest quarter of the northeast quarter of Section 2, Town 11 North, Range 77 West, South 30 degrees 15 minutes East 1006 feet from the quarter corner to Sections 2 and 35 in Towns 11 and 12 North, Range 77 West, and entitled by appropriation to use of water from said stream to Priority Number Four, [fol. 2707] by construction thereof, and thereby to the quantity of water with the number and date of the priority of the appropriation thereof, hereinafter mentioned, for the use aforesaid and for the benefit of the party or parties

lawfully entitled thereto; it is hereby adjudged and decreed that there be allowed to flow into said ditch from said stream, for the use and benefit aforesaid, under and by virtue of said appropriation by construction, Priority Number Four, nineteen and forty-four hundredths cubic feet of water per second of time, or so much thereof as may be necessary to irrigate two hundred acres of land, the appropriation of which water took effect on, and said priority dates from the 31st day of March, A. D. 1881.

No. 5—The Stuck Creek Ditch

That ditch numbered Five, named the Stuck Creek Ditch, Warren Bliler, claimant, is a ditch constructed and used for the irrigation of one hundred and sixty-five acres of land; it draws its supply of water from Stuck Creek, a tributary of the Big Laramie river, with headgate upon the left bank of said stream and situated in the southeast quarter of the southeast quarter of Section 22, Town 12 North, Range 77 West, North 25 degrees and 50 minutes West 102 feet from the southeast corner of said Section 22, and entitled by appropriation to use of water from said stream to Priority Number Five, by construction thereof, and thereby to the quantity of water with the number and date of the priority of the appropriation thereof, hereinafter mentioned, for the use aforesaid and for the benefit of the party or parties lawfully entitled thereto; [fol. 2708] it is hereby adjudged and decreed that there be allowed to flow into said ditch from said stream, for the use and benefit aforesaid, under and by virtue of said appropriation by construction, Priority Number Five, sixteen and twelve hundredths cubic feet of water per second of time, or so much thereof as may be necessary to irrigate one hundred and sixty-five acres of land, the appropriation of which water took effect on, and said priority dates from the first day of April, A. D. 1881.

No. 6—The Jim Creek Ditch

That ditch numbered Six, named the Jim Creek Ditch, James B. Arthur, claimant, is a ditch constructed and used for the irrigation of one hundred and sixty acres of land; it draws its supply of water from Jimmy Creek, a tributary of the Big Laramie river, with headgate upon the right

bank of said stream and situated in the southwest quarter of Section 36, Town 11 North, Range 76 West, North 31 degrees East 1875 feet from the corner to Sections 1, 2, 35 and 36, Towns 10 and 11 North, Range 76 West, and entitled by appropriation to use of water from said stream to Priority Number Six, by construction thereof, and thereby to the quantity of water with the number and date of the priority of the appropriation thereof, hereinafter mentioned, for the use aforesaid and for the benefit of the party or parties lawfully entitled thereto; it is hereby adjudged and decreed that there be allowed to flow into said ditch from said stream, for the use and benefit aforesaid, under and by virtue of said appropriation by construction, Priority Number Six, nine cubic feet of water per second of time or so much thereof as may be necessary to irrigate one hundred and sixty acres of land, the appropriation of which water took effect on, and said priority dates from the 10th day of July, A. D. 1881.

[fol. 2709] No. 7—The Biller and Boswell Ditch

That ditch numbered Seven, named the Bliler and Boswell Ditch, Warren Bliler and N. K. Boswell, claimants, is a ditch constructed and used for the irrigation of two hundred and twenty-five acres of land in Colorado and three hundred acres in Wyoming; it draws it supply of water from the Big Laramie river, with headgate upon the right bank of said stream in the northwest quarter of the northeast quarter of Section 35, Town 12 North, Range 77 West, South 23 degrees 40 minutes East 1002 feet from the quarter corner to sections 26 and 35 in said Town and Range, and entitled by appropriation to use of water from said stream to Priority Number Seven, by construction thereof, and thereby to the quantity of water with the number and date of the priority of the appropriation thereof, hereinafter mentioned, for the used aforesaid and for the benefit of the party or parties lawfully entitled thereto; it is hereby adjudged and decreed that there be allowed to flow into said ditch from said stream, for the use and benefit aforesaid, under and by virtue of said appropriation by construction, Priority Number Seven, sixteen and forty-three hundredths cubic feet of water per second of time, or so much thereof as may be necessary to irrigate Five

Hundred and Twenty-five acres of land, the appropriation of which water took effect on, and said priority dates from the first day of April, A. D. 1882.

[fol. 2710] No. 8—The Mansfield Ditch

That ditch numbered Eight, named the Mansfield Ditch, N. K. Boswell and C. A. Martin, claimants, is a ditch constructed and used for the irrigation of three hundred and twenty acres of land; it draws its supply of water from the Big Laramie river, with headgate upon the right bank of said stream and situated in the southeast quarter of the northeast quarter of Section 12, Town 11 North, Range 77 West, South 3 degrees 45 minutes West 1698 feet from the northeast corner of said Section 12, and entitled by appropriation to use of water from said stream to Priority Number Eight, by construction thereof, and thereby to the quantity of water with the number and date of the priority of the appropriation thereof, hereinafter mentioned, for the use aforesaid and for the benefit of the party or parties lawfully entitled thereto; it is hereby adjudged and decreed that there be allowed to flow into said ditch from said stream, for the use and benefit aforesaid, under and by virtue of said appropriation by construction, Priority Number Eight, eleven and sixty-one hundredths cubic feet of water per second of time, or so much thereof as may be necessary to irrigate three hundred and twenty acres of land, the appropriation of which water took effect on and said priority dates from the 20th day of April, A. D. 1882.

[fol. 2711] No. 9—The Yelton Ditch

That ditch numbered Nine, named the Yelton Ditch, Coe & Carter, Daniel Johnson and Joe H. Smith claimants, is a ditch constructed and used for the irrigation of two hundred and fifty acres of land; it draws its supply of water from the Big Laramie river, with headgate upon the left bank of said stream and situated in the south west quarter of the north east quarter of Section 29, Town 11 North, Range 76 West, South 21 degrees 45 minutes East 2275 feet from the quarter corner to sections 20 and 29, Town 11 North, Range 76 West, and entitled by appropriation to use of water from said stream to Priority Number Nine, by

construction thereof, and thereby to the quantity of water with the number and date of the priority of the appropriation thereof, hereinafter mentioned, for the use aforesaid and for the benefit of the party or parties lawfully entitled thereto; it is hereby adjudged and decreed that there be allowed to flow into said ditch from said stream, for the use and benefit aforesaid, under and by virtue of said appropriation by construction, Priority Number Nine, thirty and fourteen hundredths cubic feet of water per second of time, or so much thereof as may be necessary to irrigate two hundred and fifty acres of land, the appropriation of which water took effect on, and said priority dates from the first day of July, A. D. 1882.

[fol. 2712] No. 10—The Martin Ditch No. 1

That ditch numbered Ten, named the Martin Ditch No. 1, F. W. Sherwood claimant, is a ditch constructed and used for the irrigation of six hundred and forty acres of land; it draws its supply of water from the Big Laramie river, with headgate upon the right bank of said stream and situated in the north west quarter of the south east quarter of Section 15, Town 10 North, Range 76 West, South 26 degrees 45 minutes West 3282 feet from the north east corner of said Section 15, and entitled by appropriation to use of water from said stream to Priority Number Ten, by construction thereof, and thereby to the quantity of water with the number and date of the priority of the appropriation thereof, hereinafter mentioned, for the use aforesaid and for the benefit of the party or parties lawfully entitled thereto; it is hereby adjudged and decreed that there be allowed to flow into said ditch from said stream, for the use and benefit aforesaid, under and by virtue of said appropriation by construction, Priority Number Ten, fifteen and one half cubic feet of water per second of time, or so much thereof as may be necessary to irrigate six hundred and forty acres of land, the appropriation of which water took effect on, and said priority dates from the 20th day of April, A. D. 1883.

[fol. 2713] No. 11—The La Garde Ditch

That ditch numbered Eleven, named the La Garde Ditch, Daniel Johnson, Tamerlane Forrester and J. H. Detro

claimants, is a ditch constructed and used for the irrigation of one hundred and fifty acres of land; it draws its supply of water from the left bank of La Garde Creek, a tributary of the Big Laramie river, and is situated in the north west quarter of the north west quarter of Section 20, Town 11 North, Range 76 West, South 86 degrees 30 minutes East 616 feet from the north west corner of said Section 20, and entitled by appropriation to use of water from said stream to Priority Number Eleven, by construction thereof, and thereby to the quantity of water with the number and date of the priority of the appropriation thereof, hereinafter mentioned, for the use aforesaid and for the benefit of the party or parties lawfully entitled thereto; it is hereby adjudged and decreed that there be allowed to flow into said ditch from said stream for the use and benefit aforesaid, under and by virtue of said appropriation by construction, Priority Number Eleven, ten and thirty-three hundredths cubic feet of water per second of time, or so much thereof as may be necessary to irrigate one hundred and fifty acres of land, the appropriation of which water took effect on, and said priority dates from the 10th day of June, A. D. 1883.

[fol. 2714] No. 12—The Ward Ditch No. 1

That ditch numbered Twelve, named the Ward Ditch No. 1, John L. Dagle and James B. Arthur claimants, is a ditch constructed and used for the irrigation of eighty acres of land; it draws its supply of water from Jimmy Creek, a tributary of the Big Laramie river, with headgate upon the right bank of said stream and situated in the south east quarter of the south east quarter of Section 27, Town 11 North, Range 76 West, North no degrees and 20 minutes West 785 feet from the south west corner of Section 26, Town and Range aforesaid, and entitled by appropriation to use of water from said stream to Priority Number Twelve, by construction thereof, and thereby to the quantity of water with the number and date of the priority of the appropriation thereof, hereinafter mentioned, for the use aforesaid and for the benefit of the party or parties lawfully entitled thereto; it is hereby adjudged and decreed that there be allowed to flow into said ditch from said stream, for the use and benefit aforesaid, under and by virtue of said appropriation by construction, Priority

Number Twelve, four and twenty-five hundredths cubic feet of water per second of time, or so much thereof as may be necessary to irrigate eighty acres of land, the appropriation of which water took effect on, and said priority dates from the 15th day of June, A. D. 1883.

[fol. 2715] No. 13—The Ward Ditch No. 2

That ditch numbered Thirteen, named the Ward Ditch No. 2, John L. Dagle claimant, is a ditch constructed and used for the irrigation of fifty acres of land; it draws its supply of water from Jimmy Creek, a tributary of the Big Laramie river, with headgate upon the left bank of said stream and situated in the south west quarter of the south west quarter of Section 26, Town 11 North, Range 76 West, North 6 degrees 45 minutes East 326 feet from the south east corner of Section 27 in said Town and Range, and entitled by appropriation to use of water from said stream to Priority Number Thirteen, by construction thereof, and thereby to the quantity of water with the number and date of the priority of the appropriation thereof, hereinafter mentioned, for the use aforesaid and for the benefit of the party or parties lawfully entitled thereto; it is hereby adjudged and decreed that there be allowed to flow into said ditch from said stream, for the use and benefit aforesaid, under and by virtue of said appropriation by construction, Priority Number Thirteen, nine and forty-eight hundredths cubic feet of water per second of time, or so much thereof as may be necessary to irrigate fifty acres of land, the appropriation of which water took effect on, and said priority dates from the first day of July, A. D. 1883.

[fol. 2716] No. 14—The Jimmy Creek Ditch

That ditch numbered Fourteen, named the Jimmy Creek Ditch, Daniel Johnson and Coe & Carter claimants, is a ditch constructed and used for the irrigation of two hundred acres of land; it draws its supply of water from Jimmy Creek and from the Big Laramie river, with its upper headgate upon the right bank of said Big Laramie river in the south east quarter of section 20, Town 11 North, Range 76 West, and with its crossing or headgate upon Jimmy Creek in the south east quarter of Section 17 of said Town and Range, and entitled by appropriation to

use of water from said streams to Priority Number Fourteen by construction thereof, and Priority Number Twenty-two, by extension thereof, and thereby to the quantity of water with the numbers and dates of the several priorities of the appropriation thereof, hereinafter mentioned, for the use aforesaid and for the benefit of the party or parties lawfully entitled thereto;

It is hereby adjudged and decreed that there be allowed to flow into said ditch from said Jimmy Creek, for the use and benefit aforesaid, under and by virtue of said appropriation by construction Priority Number Fourteen, five and fifty-two hundredths cubic feet of water per second of time, or so much thereof as may be necessary to irrigate two hundred acres of land, the appropriation of which water took effect on, and said priority dates from the first day of June, A. D. 1884.

And it is further adjudged and decreed that when said amount of water is not to be had in said Jimmy Creek, or it is desirable to fill said ditch from the Big Laramie river instead of from Jimmy Creek, that there be allowed to flow into said ditch from said Big Laramie river, for the use and benefit aforesaid, under and by virtue of said appropriation by extension, Priority Number Twenty-two, the said amount of water, to-wit, five and fifty-two hundredths cubic feet per second of time, or so much as may be necessary to irrigate two hundred acres of land, being a total [fol. 2717] appropriation of water from said Jimmy Creek and Big Laramie river of five and fifty-two hundredths cubic feet per second of time, the last mentioned appropriation taking effect upon and said priority dating from the first day of May, A. D. 1891.

No. 15—The Smiths' Brown Ditch

That ditch numbered Fifteen, named the Smiths' Brown Ditch, Joe H. Smith and James E. Smith claimants, is a ditch constructed and used for the irrigation of one hundred and sixty acres of land; it draws its supply of water from the Big Laramie river with two headgates, one South 25 degrees 50 minutes East 3146 feet, and the other South 2 degrees 50 minutes East 1358 feet from the north east corner of Section 32, Town 11 North, Range 76 West, and entitled by appropriation to use of water from said stream to Priority Number Fifteen, by construction thereof, and

thereby to the quantity of water with the number and date of the priority of the appropriation thereof, hereinafter mentioned, for the use aforesaid and for the benefit of the party or parties lawfully entitled thereto; it is hereby adjudged and decreed that there be allowed to flow into said ditch from said stream, for the use and benefit aforesaid, under and by virtue of said appropriation by construction, Priority Number Fifteen, sixteen and fifty-three hundredths cubic feet of water per second of time, or so much thereof as may be necessary to irrigate one hundred and sixty acres of land, the appropriation of which water took effect on, and said priority dates from the 10th day of June, A. D. 1884.

[fol. 2718] No. 16—The Trollope Creek Ditch

That ditch numbered Sixteen, named the Trollope Creek Ditch, John L. Dagle claimant, is a ditch constructed and used for the irrigation of eighty acres of land; it draws its supply of water from Trollope Creek, a tributary of Jimmy Creek which is a tributary of the Big Laramie river, with headgate upon the right bank of said Trollope Creek in the south west quarter of the south west quarter of Section 23, Town 11 North, Range 76 West, and entitled by appropriation to use of water from said stream to Priority Number Sixteen, by construction thereof, and Priority Number Thirty, by enlargement thereof, and thereby to the quantity of water with the numbers and dates of the priorities of the appropriation thereof, hereinafter mentioned, for the use aforesaid and for the benefit of the party or parties lawfully entitled thereto;

It is hereby adjudged and decreed that there be allowed to flow into said ditch from said stream, for the use and benefit aforesaid, under and by virtue of said appropriation by construction, Priority Number Sixteen, six and eighty-nine hundredths cubic feet of water per second of time, or so much thereof as may be necessary to irrigate eighty acres of land, the appropriation of which water took effect on, and said priority dates from the 15th day of June, A. D. 1884.

And further that there be allowed to flow into said ditch from said stream for the use and benefit aforesaid, under and by virtue of said appropriation by enlargement, Priority Number Thirty, additional water to the amount of ten

and eighty-six hundredthc cubic feet per second of time, or so much thereof as may be necessary to irrigate eighty acres of land; the appropriation of which last mentioned water took effect on, and said priority dates from the 29th day of May, A. D. 1896.

[fol. 2719] No. 17—The Homestead Ditch

That ditch numbered Seventeen, named the Homestead Ditch, Victor G. H. Stuart and Alexander Stuart claimants, is a ditch constructed and used for the irrigation of one hundred acres of land; it draws its supply of water from a branch of the McIntyre Creek which is a tributary of the Big Laramie river, with headgate upon the left bank of said branch and situated in the north east quarter of the south east quarter of Section 6, Town 10 North, Range 76 West, North 24 degrees 50 minutes West 1800 feet from the south east corner of said Section 6, and entitled by appropriation to use of water from said stream to Priority Number Seventeen, by construction thereof, and thereby to the quantity of water with the number and date of the priority of the appropriation thereof, hereinafter mentioned, for the use aforesaid and for the benefit of the party or parties lawfully entitled thereto; it is hereby adjudged and decreed that there be allowed to flow into said ditch from said stream, for the use and benefit aforesaid, under and by virtue of said appropriation by construction, Priority Number Seventeen, nine cubic feet of water per second of time, or so much thereof as may be necessary to irrigate one hundred acres of land, the appropriation of which water took effect on, and said priority dates from the 10th day of July, A. D. 1884.

[fol. 2720] No. 18—The Martin Ditch No. 2

That ditch numbered Eighteen, named the Martin Ditch No. 2, F. W. Sherwood claimant, is a ditch constructed and used for the irrigation of six hundred and forty acres of land; it draws its supply of water from the Big Laramie river, with headgate upon the south west quarter of the north east quarter of Section 10, Town 10 North, Range 76 West, South 4 degrees 35 minutes East 1920 feet from the quarter corner to Sections 3 and 10 in said Town and Range, and entitled by appropriation to use of water from

said stream to Priority Number Eighteen, by construction thereof, and thereby to the quantity of water with the number and date of the priority of the appropriation thereof, hereinafter mentioned, for the use aforesaid, and for the benefit of the party or parties lawfully entitled thereto; it is hereby adjudged and decreed that there be allowed to flow into said ditch from said stream, for the use and benefit aforesaid, under and by virtue of said appropriation by construction, Priority Number Eighteen fourteen and one half cubic feet of water per second of time, or so much thereof as may be necessary to irrigate six hundred and forty acres of land, the appropriation of which water took effect on, and said priority dates from the 30th day of April, A. D. 1887.

[fol. 2721] No. 19—The Grace Creek Ditch

That ditch numbered Nineteen, named the Grace Creek Ditch, Laona E. Hance claimant, is a ditch constructed and used for the irrigation of eighty acres of land; it draws its supply of water from Grace Creek, a tributary of the Big Laramie river, with headgate upon the left bank of said stream and situated in the north west quarter of the north west quarter of Section 14, Town 11 North, Range 77 West, South 37 degrees 45 minutes East 574 feet from the north west corner of said Section 14, and entitled by appropriation to use of water from said stream to Priority Number Nineteen, by construction thereof, and thereby to the quantity of water with the number and date of the priority of the appropriation thereof, hereinafter mentioned, for the use aforesaid and for the benefit of the party or parties lawfully entitled thereto; it is hereby adjudged and decreed that there be allowed to flow into said ditch from said stream, for the use and benefit aforesaid, under and by virtue of said appropriation by construction, Priority Number Nineteen, three and seven hundredths cubic feet of water per second of time, or so much thereof as may be necessary to irrigate eighty acres of land, the appropriation of which water took effect on, and said priority dates from the first day of April, A. D. 1888.

[fol. 2722] No. 20—The Brown Ditch

That ditch numbered Twenty, named the Brown Ditch, C. C. Forrester claimant, is a ditch constructed and used

for the irrigation of one hundred acres of land; it draws its supply of water from Nun Creek, a tributary of the Big Laramie river, with headgate upon the right bank of said stream and situated in the north west quarter of the north west quarter of Section 36, Town 10 North, Range 76 West, about nine hundred feet south easterly from the north west corner of said section 36, and entitled by appropriation to use of water from said stream to Priority Number Twenty, by construction thereof, and thereby to the quantity of water with the number and date of the priority of the appropriation thereof, hereinafter mentioned, for the use aforesaid and for the benefit of the party or parties lawfully entitled thereto; it is hereby adjudged and decreed that there be allowed to flow into said ditch from said stream, for the use and benefit aforesaid, under and by virtue of said appropriation by construction, Priority Number Twenty, ten cubic feet of water per second of time, or so much thereof as may be necessary to irrigate one hundred acres of land, the appropriation of which water took effect on, and said priority dates from the 31st day of May, A. D. 1890.

[fol. 2723] No. 21—The Lamb Ditch

That ditch numbered Twenty-one, named the Lamb Ditch, Clara N. Smith, claimant, is a ditch constructed and used for the irrigation of one hundred and sixty acres of land; it draws its supply of water from the McIntyre Creek, a tributary of the Big Laramie river, with headgate upon the right bank of said stream and situated North 15 degrees 45 minutes East 2196 feet from the south west corner of Section 5, Town 10 North, Range 76 West, and entitled by appropriation of water from said stream to Priority Number Twenty-one, by construction thereof, and thereby to the quantity of water with the number and date of the priority of the appropriation thereof, hereinafter mentioned, for the use aforesaid and for the benefit of the party or parties lawfully entitled thereto; it is hereby adjudged and decreed that there be allowed to flow into said ditch from said stream, for the use and benefit aforesaid, under and by virtue of said appropriation by construction, Priority Number Twenty-one, three and eighty-eight hundredths cubic feet of water per second of time, or so much thereof as may be necessary to irrigate one hundred and

sixty acres of land, the appropriation of which water took effect on, and said priority dates from the first day of June, A. D. 1890.

[fol. 2724] No. 22—The Laramie River Ditch

That ditch numbered Twenty-two, named the Laramie River Ditch, The Water Supply and Storage Company claimant, is a ditch constructed and used for the irrigation of about 30,000 acres of land and for the filling of claimant's reservoirs Nos. 1, 2, 3, 4, and 5 and Chambers' Lake. Its headgate is located upon the right bank of the West branch of the Big Laramie river, at a point from which the quarter corner to Sections 11 and 14, Town 8 North, Range 76 West, bears North 10 degrees 16 minutes East 2817 feet. The ditch is smallest at its headgate and upper end, where it draws its chief supply of water from said West branch of the Big Laramie river, and it increases in size and capacity from the headgate down to its lower end at Chambers Lake and intercepts and appropriates the waters of Two and a Half Mile Creek, Three Quarter Mile Creek, Half Mile Creek and other small branches crossing the line of the ditch between its headgate and its mouth. The capacity of the ditch at the headgate is two hundred and forty-two cubic feet of water per second of time, and said amount is augmented by the increasing carrying capacity of the ditch toward its lower end and the appropriation of the waters of the intersecting streams along the line of the ditch, as aforesaid, to a total capacity of 400 cubic feet of water per second of time. Said ditch is entitled by construction and appropriation of water to use to Priority Number Twenty-three, for the uses aforesaid and for the benefit of the party or parties lawfully entitled thereto;

It is hereby adjudged and decreed that there be allowed to flow into said ditch, for the uses and benefit aforesaid, under and by virtue of said appropriation by construction, [fol. 2725] Priority Number Twenty-three, two hundred and forty-two cubic feet of water per second of time at its headgate, and also one hundred and fifty-eight cubic feet of water per second of time from the tributaries crossing the line of the ditch, being a total appropriation of 400 cubic feet of water per second of time; the appropriation

of all which water took effect on, and said priority dates from the 7th day of August, A. D. 1891.

And it is further adjudged and decreed that the said The Water Supply & Storage Company, claimant herein, be entitled by reason of the construction and operation of said ditch, and its use in carrying and delivering water for storage purposes for irrigation, to Priority numbered One of this Water District. When not needed by prior appropriators for immediate irrigation, the said Company shall have the right to take and carry and store in its reservoirs Nos. 1, 2, 3, 4, and 5 and in Chambers Lake, water from said West branch of said Big Laramie river and its tributaries to the amount of 500,000,000 cubic feet annually. And said reservoir priority Number One shall take effect on and bear even date with the priority hereinbefore decreed to said the Laramie River Ditch, to-wit, the 7th day of August, A. D. 1891.

No. 23—The Comet Ditch

That ditch numbered Twenty-three, named the Comet Ditch, Victor G. H. Stuart claimant, is a ditch constructed and used for the irrigation of two hundred and eighty acres of land; it draws its supply of water from the McIntyre Creek, a tributary of the Big Laramie river, with headgate upon the left bank of said stream in the north west quarter of the north east quarter of Section 17, Town 10 North, Range 76 West, South 14 degrees 45 minutes East 1288 feet [fol. 2726] from the quarter corner to Sections 8 and 17 in said Town and Range, and entitled by appropriation to use of water from said stream to Priority Number Twenty-four, by construction thereof, and thereby to the quantity of water with the number and date of the priority of the appropriation thereof, hereinafter mentioned, for the use aforesaid and for the benefit of the party or parties lawfully entitled thereto; it is hereby adjudged and decreed that there be allowed to flow into said ditch from said stream, for the use and benefit aforesaid, under and by virtue of said appropriation by construction, Priority Number Twenty-four, seven and four-tenths cubic feet of water per second of time, or so much thereof as may be necessary to irrigate two hundred and eighty acres of land, the appropriation of which water took effect on, and said priority dates from the 7th day of December, A. D. 1892.

No. 24.—The Forrester Ditch

That ditch numbered Twenty-four, named the Forrester Ditch, C. C. Forrester claimant, is a ditch constructed and used for the irrigation of eighty acres of land; it draws its supply of water from Brown Creek, a tributary of the Big Laramie river, with headgate upon the right bank of said stream in the north west quarter of Section 25, Town 10, North, Range 76 West, and entitled by appropriation to use of water from said stream to Priority Number Twenty-five, by construction thereof, and thereby to the quantity of water with the number and date of the priority of the appropriation thereof, hereinafter mentioned, for the use aforesaid and for the benefit of the party or parties lawfully entitled thereto; it is hereby adjudged and decreed that there be allowed to flow into said ditch from said stream, for the use and benefit aforesaid, under and by virtue of said appropriation by construction, Priority Num- [fol. 2727] ber Twenty-five, seven cubic feet of water per second of time, or so much thereof as may be necessary to irrigate eighty acres of land, the appropriation of which water took effect on, and said priority dates from the 15th day of May, A. D. 1893.

No. 25—The Pache Ditch

That ditch numbered Twenty-five, named the Pache Ditch, August Pache claimant, is a ditch constructed and used for the irrigation of two hundred and twenty acres of land; it draws its supply of water from La Garde Creek, a tributary of the Big Laramie river, with headgate upon the right bank of said stream and situated in the north east quarter of the north west quarter of Section 31, Town 11 North, Range 76 West, South 61 degrees West 1118 feet from the quarter corner to Sections 30 and 31 in said Town and Range, and entitled by appropriation to use of water from said stream to Priority Number Twenty-six, by construction thereof, and thereby to the quantity of water with the number and date of the priority of the appropriation thereof, hereinafter mentioned, for the use aforesaid and for the benefit of the party or parties lawfully entitled thereto; it is hereby adjudged and decreed that there be allowed to flow into said ditch from said stream, for the use and benefit aforesaid, under and by virtue of said appropriation by construction, Priority Number Twenty-six

eighteen and fourteen hundredths cubic feet of water per second of time, or so much thereof as may be necessary to irrigate two hundred and twenty acres of land, the appropriation of which water took effect on, and said priority dates from the 25th day of May, A. D. 1893.

[fol. 2728] No. 26—The Link Ditch No. 1

That ditch numbered Twenty-six, named the Link Ditch No. 1, Mary E. Link claimant, is a ditch constructed and used for the irrigation of two hundred acres of land; it draws its supply of water from the Big Laramie river, with headgate upon the right bank of said stream and situated in the south east quarter of the north east quarter of Section 11, Town 9 North, Range 76 West, about 660 feet North of the center line of said Section eleven, and entitled by appropriation to use of water from said stream to Priority Number Twenty-seven, by construction thereof, and thereby to the quantity of water with the number and date of the priority of the appropriation thereof, hereinafter mentioned, for the use aforesaid and for the benefit of the party or parties lawfully entitled thereto; it is hereby adjudged and decreed that there be allowed to flow into said ditch from said stream, for the use and benefit aforesaid, under and by virtue of said appropriation by construction, Priority Number Twenty-seven, fourteen and twenty-two hundredths cubic feet of water per second of time, or so much thereof as may be necessary to irrigate two hundred acres of land the appropriation of which water took effect on, and said priority dates from the first day of June, A. D. 1894.

[fol. 2729] No. 27—The Lone Tree Ditch

That ditch numbered Twenty-seven, named the Lone Tree Ditch, F. W. Sherwood claimant, is a ditch constructed and used for the irrigation of two hundred acres of land; it draws its supply of water from Lone Tree Creek, a tributary of the Big Laramie river, with headgate upon the right bank of said stream and situated in the south west quarter of Section 11, Town 10 North, Range 76 West, South 51 degrees 10 minutes East 2108 feet from the quarter corner to Sections 10 and 11 in said Town and Range, and entitled by appropriation to use of water from said stream to Priority Number Twenty-eight, by construction thereof,

and thereby to the quantity of water with the number and date of the priority of the appropriation thereof, hereinafter mentioned, for the use aforesaid and for the benefit of the party or parties lawfully entitled thereto; it is hereby adjudged and decreed that there be allowed to flow into said ditch from said stream for the use and benefit aforesaid, under and by virtue of said appropriation by construction, Priority Number Twenty-eight, twenty-five cubic feet of water per second of time, or so much thereof as may be necessary to irrigate two hundred acres of land, the appropriation of which water took effect on, and said priority dates from the 24th day of October, A. D. 1894.

No. 28—The French Woman Ditch (Conditional)

That ditch numbered Twenty-eight, named the French Woman Ditch, is a ditch in process of construction to be used when completed for the irrigation of one hundred and twenty acres of land; no application of water to a beneficial use has yet been made. Its headgate is upon the left bank of the French Woman Creek, a tributary of Jimmy [fol. 2730] Creek which flows into the Big Laramie river, and is situated in the north east quarter of the north west quarter of Section 22, Town 11 North, Range 76 West, North 33 degrees 55 minutes West 6310 feet from the South east corner of said Section 22. If said ditch shall be completed and the water actually appropriated and applied to irrigation within a reasonable time from the commencement of the work thereon, according to the nature of the work of constructing said ditch and in accordance with the plan thereof heretofore given in evidence in this matter, the said ditch will be entitled to a priority numbered Twenty-nine, by construction of the ditch, for seven and fifty-six hundredths cubic feet of water per second of time, or so much thereof as may be necessary to irrigate one hundred and twenty acres of land, the appropriation of which water, in such event, shall take effect on and said priority shall date from the 28th day of May, A. D. 1896.

No. 29—The Slough Creek Ditch

That ditch numbered Twenty-nine, named the Slough Creek Ditch, Charles A. Martin claimant, is a ditch constructed and *for* used for the irrigation of thirty-five acres

of land; it draws its supply of water from Slough Creek, a tributary of Grace Creek which is a tributary of the Big Laramie river, with headgate upon the left bank of said stream and situated in the north west quarter of the south west quarter of Section 2, Town 11 North, Range 77 West, South 14 degrees 5 minutes East 465 feet from the quarter corner to Sections 2 and 3 in said Town and Range, and entitled by appropriation to use of water from said stream to Priority Number Thirty-one, by construction thereof, and thereby to the quantity of water with the number and date [fol. 2731] of the *the* priority of the appropriation thereof, hereinafter mentioned, for the use aforesaid and for the benefit of the party or parties lawfully entitled thereto; it is hereby adjudged and decreed that there be allowed to flow into said ditch from said stream, for the use and benefit aforesaid, under and by virtue of said appropriation by construction, Priority Number Thirty-one, four and eleven hundredths cubic feet of water per second of time, or so much thereof as may be necessary to irrigate thirty-five acres of land, the appropriation of which water took effect on, and said priority dates from the 30th day of May, A. D. 1896.

No. 30—The Link Ditch No. 2

That ditch numbered Thirty, named the Link Ditch No. 2, Wallis A. Link claimant, is a ditch constructed and used for the irrigation of fifty acres of land; it draws its supply of water from a branch of the Big Laramie river, with headgate in the north east quarter of the north west quarter of Section 2, Town 9 North, Range 76 West, and entitled by appropriation to use of water from said stream to Priority Number Thirty-two, by construction thereof, and thereby to the quantity of water with the number and date of the priority of the appropriation thereof, hereinafter mentioned, for the use aforesaid, and for the benefit of the party or parties lawfully entitled thereto; it is hereby adjudged and decreed that there be allowed to flow into said ditch from said stream, for the use and benefit aforesaid, under and by virtue of said appropriation by construction, Priority Number Thirty-two, two cubic feet of water per second of time, or so much thereof as may be necessary to irrigate fifty acres of land, the appropriation

of which water took effect on, and said priority dates from the 15th day of June, A. D. 1896.

[fol. 2732] And it is further ordered, adjudged and decreed that all of those said appropriations of water hereby found and adjudged to have been so as aforesaid made from the water of the said Big Laramie river and of its said several tributaries, and numbered in order of priority of time of their severally taking effect, from one to thirty-two inclusive, as above set forth in the several paragraphs of this decree, are to be taken, held and enjoyed for the uses in said paragraphs, severally and respectively, to each said appropriation set forth, and with priority of right in manner and order as aforesaid.

And it is further ordered, adjudged and decreed that the foregoing award and allowance of water to flow into each of said ditches in this decree mentioned and numbered as aforesaid, is subject to and shall be allowed to flow into each such ditches or feeders in accordance with the above mentioned priorities, and that all Water Commissioners and their assistants or other officers whose duty it is or may be to make or cause to be made a distribution of water for irrigation among the several ditches and feeders or reservoirs hereinabove mentioned, shall at all times in making such distribution, observe and maintain the aforesaid order of priority among all said ditches and feeders, and distribute water accordingly.

By the Court.

Jay H. Boughton, Judge.

[fol. 2733] STATE OF COLORADO,
County of Larimer, ss:

I, W. P. Hurley, Clerk of the District Court, of the Eighth Judicial District of the State of Colorado within and for Larimer County, do hereby certify the foregoing to be a true, perfect and complete copy of Findings and Decree "In the Matter of the Adjudication of the Priority of Right to the Use of Water for Irrigation in Water District No. 48, State of Colorado," in Case No. 1247 entered on the 30th day of October, 1896.

In testimony whereof I have hereunto set my hand and affixed the seal of said Court, at my office in Fort Collins, Colorado, this 22nd day of May, A. D. 1933.

W. P. Hurley, Clerk. (Seal.)

STATE OF COLORADO,
County of Larimer, ss:

I, Claude C. Coffin, Judge of the District Court of the Eighth Judicial District of the State of Colorado within and for the County of Larimer, do hereby certify that W. P. Hurley, whose name is subscribed to the foregoing Certificate of Attestation, now is, and was, at the time of signing and sealing the same, Clerk of the District Court of Larimer County aforesaid, and keeper of the Records and seal thereof, duly appointed and qualified to office; that full faith and credit are and of right ought to be given to all his official acts as such in all Courts of Record and elsewhere; and that his said attestation is in due form of law, and by the proper officer.

Given under my hand and seal this 22nd day of May, A. D. 1933.

Claude C. Coffin (Seal).

STATE OF COLORADO,
County of Larimer, ss:

I, W. P. Hurley, Clerk of the District Court of the Eighth Judicial District of the State of Colorado, within and for Larimer County, do hereby certify that ——, —— whose genuine signature is appended to the foregoing certificate, was, at the time of signing the same, Judge of the District Court of Larimer County, of the State of Colorado, duly commissioned and qualified; that full faith and credit are and of right ought to be given to all his official acts as such, in all Courts of Record, and elsewhere.

In testimony whereof, I have hereunto set my hand and affixed the seal of said Court, at my office in ——, Colo., this 22nd day of May, A. D. 1933.

W. P. Hurley, Clerk. (Seal)

[fol. 2734] DEFENDANT'S EXHIBIT G

In the Matter of the Adjudication of Priority of Right to Use of Water for Irrigation in Water District N-. 48, State of Colorado

Findings

The following are the findings of fact and law by the referee upon which the decree to be reported to the Court

will be based in the matter of the Adjudication of priority of right to use of water for irrigation purposes in Water District No. 48, State of Colorado:

Ditches

No. 31—La Garde Ditch No. 1	Priority No. 33
No. 32—Detro Ditch No. 1	Priority No. 34
No. 33—Sand Creek Ditch	Priority No. 35
No. 34—Parker Ditch	Priority No. 36

No. 54—Long Park Ditch	Priority No. 59

Reservoir

No. 2—Porter Lake	Priority No. 2

The ditches in said district are named and numbered as above, (except the Lamb Ditch No. 21 and the Grace Creek Ditch No. 19, which were named and numbered by a former decree) and placed in the order of their priorities as estab- [fol. 2735] lished by the decree rendered herein, likewise the reservoir. The findings of the referee in respect to the ownership, location, size, date and amount of the several

appropriations and the amount of land irrigated, are in respect to each of said several ditches and said reservoir, respectively as follows:

No. 31—LaGarde Ditch No. 1

The ditch is owned by Harry Tatham and William Tatham. The headgate is located at a point on the right bank of LaGarde creek from whence it draws its supply of water, whence the west quarter section corner of section No. 29, township 11, N. Range 76 West, bears S. 10 degrees 45′ E. 1005 feet.

It is one foot deep, 5 feet wide at the top, 3 feet wide at the bottom; its grade is 5 feet per thousand feet and its length is 4,600 feet; its carrying capacity is 15.4 cubic feet per second of time and is used to irrigate 106 acres of land.

The ditch was built during the month of June, 1880 and was begun on June 1st, 1880. On October 30, 1896, a final decree was rendered in Water District No. 48 by the District Court of Larimer County and that more than four years has lapsed since the rendering of said decree. That a right of appropriation for the LaGarde Ditch No. 1, dated June 1st, 1880, would be adverse to the right of all parties whose rights of priority were established by said decree, as bearing date subsequent to June 1st, 1880, and prior to June 15th, 1896; that the Priority by construction for LaGarde Ditch No. 1 should be numbered 33 and bear date, June 16th, 1896, for 15.4 cubic feet of water per second of time.

[fol. 2736] No. 32—Detro Ditch No. 1

The ditch is owned by J. H. Detro.

The headgate is located at a point on the left bank of Forrester creek from whence it draws its water supply, whence the southeast corner of section 12, township 11, N. R. 77 W., bears S. 35 degrees 50′ W. 1320 feet. Its general course is North-westerly.

It is 15 inches deep, 2.5 feet wide of top and 1.5 feet wide at the bottom; its grade is 46.7 feet to the mile, and its capacity is 9 cubic feet per second of time and it irrigates 28 acres of land. Claimant asks for a decree for 5 cubic feet per second of time.

The ditch was built in the month of June, 1882, and water was run in the ditch for irrigation purposes on June 12th, 1882. I further find that a final decree was rendered in Water District No. 48, by the District Court of Larimer County, Colorado, on October the 30th, 1896, and that more than four years has lapsed since the rendering of said decree; that a decree for appropriation for the Detro Ditch No. 1, dated June 12, 1882, would be adverse to the interests of all parties whose rights of priority were established by said decree, as bearing date subsequent to June 12th, 1882, and prior to June 15th, 1896, said last named date being the date of latest appropriation established by said decree; that the Priority, by construction for Detro Ditch No. 1, should be numbered 34, for 5 cubic feet of water per second of time and bear date, June 17th, 1896.

[fol. 2737] No. 33—Sand Creek Ditch

The ditch is owned by August Wurl.

The headgate is located on the left bank of Sand Creek, from which it draws its supply of water at a point whence the south quarter section corner of section 10, T. 11, N. R. 75 W., bears south 60 degrees 10′ west 1880 feet.

Work on the ditch was begun on September 1st, 1886, and it was completed about the first of July, 1888.

The ditch is 9 feet wide on the top and 7 feet wide on the bottom; 18 inches deep and its grade is 12 feet to the mile and it is 14,000 feet long. It irrigates 281 acres of land.

I further find that a final decree was rendered in Water District No. 48 by the District Court of Larimer County, Colo., on October 30th, 1896, and that more than four years has lapsed since the rendering of said decree; that a decree for appropriation of water for the Sand Creek Ditch, dated September 1st, 1886, would be adverse to the interests of all parties whose rights of priority were established by said decree, as bearing date subsequent to September 1st, 1886, and prior to June 15th, 1896, said last named date being the date of the latest appropriation established by said decree; that the priority, by construction, for Sand Creek Ditch should be numbered 35 and bear date June 18th, 1896, for 29 cubic feet of water per second of time.

[fol. 2738] No. 34—Parker Ditch

Parker Ditch is owned by Thos. H. Davy and A. deV. Baldwin.

Its headgate is located at a point whence the S.E. quarter of N.E. quarter corner section 26, T. 10, N. R. 76 W., bears northeasterly 300 feet.

It is five — wide at the bottom and six feet wide at high water line; 18 inches deep and its grade is 7⅓ feet to the mile and its carrying capacity is 14.1 cubic feet per second of time. It is used to irrigate 160 acres of land.

It is entitled to Priority No. 36, by construction, for 14.1 cubic feet of water per second, bearing date October 10th, 1896.

[fol. 2739] No. 35—Ben Warren Ditch

The ditch is owned by Thos. H. Davy. The headgate is located on the north bank of a branch of the Big Laramie river at a point in the northwest quarter of the southwest quarter of section 25, T. 9, N. R. 76 W.

As originally constructed the ditch was four feet wide at high water line, three feet wide at the bottom and one foot deep and had a carrying capacity of 4.22 cubic feet of water per second of time and was built to irrigate one hundred acres of land. The original construction of the ditch was begun on July 15, 1897.

On July 15, 1900, the ditch was enlarged, increasing its capacity 3.28 cubic feet per second by making it one foot wider at the bottom and two feet wider at high water line.

It is entitled to Priority No. 37, by construction, for 4.22 cubic feet of water per second of time, bearing date, July 15th, 1897.

It is entitled to a further Priority No. 43 by enlargement for 3.28 cubic feet of water per second of time bearing date, July 15, 1900.

[fol. 2740] No. 36—Sand Creek Ditch System

It is owned by the Divide Canal and Reservoir Company.

It includes Columbine Ditch, Dead Man Ditch, and Sand Creek Proper. Columbine Ditch has a capacity of 40 cubic feet of water per second which it at present discharges into

the North Fork of the Poudre river. Dead Man ditch has a capacity of 117 cubic feet per second of time which it discharges into the head of Sand Creek. These waters, after being thus discharged into Sand Creek run naturally down that stream, cutting through several natural reservoirs, to a point 83 degrees 45′ east 560 feet from the south quarter corner of section 22, township 11 N., R. 67 (?) where it is taken, with other waters of Sand Creek by means of a ditch of 288 cubic feet capacity and discharged into Sheep Creek, a branch of the North Fork of the Cache laPoudre river, at a point 10 degrees 25′ east 500 feet from the north quarter corner of section 23. Columbine ditch commences at one of the branches of Columbine stream, cuts two other small branches and carries the water into the Poudre river. The Dead Man ditch cuts the main branch of Dead Man Creek and two other branches of the same creek. The system includes an uncompleted ditch connecting Columbine ditch and Dead Man ditch for the purpose of discharging all of the waters of the system of ditches combined in the one ditch, into the Poudre river at the same point and through Sand Creek and Sheep creek.

The amount of land to be irrigated is 50,000 acres.

The Sand Creek Ditch System is entitled to Priority Number 38, by construction, for 288 cubic feet of water per second of time, bearing date, June 15, 1899.

[fol. 2741] No. 37—Spring Creek Ditch No. 1

The ditch is owned by August Wurl.

Its headgate is located on the left bank of Spring creek from whence it draws its water supply, at a point whence the south-west quarter corner section 26, T. 12, N. R. 75 W., bears S. 64 degrees W. 1941 feet.

It is 2½ feet wide on the top, 2 feet on the bottom and one foot deep; 6,300 feet long and has a grade of 5.28 feet per mile and carrying capacity of 2.7 cubic feet per second of time. It irrigates 69 acres of land.

It is entitled to Priority No. 39, for 2.7 cubic feet of water per second of time, bearing date April 15th, 1900.

No. 19—Grace Creek Ditch

The ditch is owned by Ernest W. Johnson.

Headgate is on the left bank of Grace creek, at a point whence the north-west quarter corner of section 14, T. 11,

N. R. 77 W., bears S. 37 degrees 45′ E. 574 feet.

The ditch is 5 feet wide on the top and 4 feet wide on the bottom and its carrying capacity, as enlarged, is 10 cubic feet per second of time.

In the fall of 1899 and spring of 1900 the ditch was enlarged by making it 2 feet wider at the top and 1 foot wider at the bottom, which added to the capacity of the ditch 6.3 cubic feet per second of time; its original capacity was 3.7 cubic feet. The first appropriation of water by the enlargement was on April 28, 1900. It irrigates about 230 acres of land by reason of the enlargement.

It is entitled to Priority No. 40 by enlargement, for 6.3 cubic feet or water per second of time, to bear date April 28th, 1900.

[fol. 2742] No. 38—Seepage Ditch No. 2

The ditch is owned by August Wurl.

Its headgate is located on the left bank of Spring Gulch, from which it draws its supply of water, whence the S. quarter section corner, section 35, T. 12, N. R. 75 W., bears S. 11 degrees W. 1386 feet.

It is 5 feet wide at the top and 4 feet wide at the bottom and one foot deep; its length is 18,000 feet, its grade 5.28 feet per mile and its carrying capacity 5.85 cubic feet per second of time. It irrigates 621 acres of land.

It is entitled to Priority No. 41, by construction, for 5.85 cubic feet of water per second of time, bearing date, May 1st, 1900.

No. 39—Spring Creek Ditch No. 2

The ditch is owned by August Wurl.

Its headgate is located on the left bank of Spring creek, from which it draws its supply of water at a point whence the S. quarter section corner of Sec. 23, T. 12, N. R. 75 W., bears S. 22 degrees W. 853 feet.

It is three feet wide at the top and two feet wide at the bottom and 18 inches deep; it is 5,800 feet long, has a grade of 6 feet per mile and its carrying capacity is 6.6 cubic feet per second of time. It irrigates 76 acres of land.

It is entitled to Priority No. 42, by construction for 6.6 cubic feet of water per second of time, bearing date, May 2nd, 1900.

[fol. 2743] No. 40—Brown Ditch

The ditch is owned by James R. Fortune. It is used to irrigate 160 acres of land. It takes its water from Porter creek, a tributary of the Big Laramie River. The headgate is located at a point whence the northwest corner of section 24, T. 9, N. R. 76 W., bears N. 64 degrees and 26′ W. 1695.1 feet.

It is 2233 feet long, 3 feet wide at the bottom and four feet wide at the top and 18 inches deep; has a grade of 35.9 feet to the mile and a carrying capacity of 15.9 cubic feet per second of time. Work was commenced on the ditch in June 1896, statement filed as platted September 10th, 1900, from which date priority of appropriation is prayed for.

It is entitled to Priority No. 44 by construction for 15.9 cubic feet of water per second of time bearing date Sept. 10th, 1900.

[fol. 2744] No. 41—Springer Ditch

It is owned by Thomas H. Davy and E. E. Springer.

The headgate is located on the south-east quarter of section 36, township 9, North Range 76 W.

It — four feet wide at the bottom, six feet wide at the top and 18 inches deep; thre--fourths of a mile in length, its grade *l*s 12 feet to the mile and its carrying capacity 8 cubic feet per second of time. It irrigates 130 to 140 acres of land.

It is entitled to Priority No. 45, by construction, for 8 cubic feet of water per second of time, bearing date September 11th, 1900.

No. 42—Davy Ditch

The ditch is owned by Thomas H. Davy.

Its headgate is located on the north bank of Dead Man creek from whence it draws its supply of water, at a point whence the south-east corner of section 36, T. 10, N. R. 76 W., bears S. 46 degrees 24′ E. 958.8 feet.

The ditch is five feet wide on the bottom and six feet wide at high water line; its depth is 18 inches; its length 2½ miles, its grade 15.8 feet per mile and its carrying capacity 20 cubic feet per second of time. It irrigates from 300 to 325 acres of land.

It is entitled to Priority No. 46, by construction, for 20 cubic feet of water per second of time, bearing date September 15th, 1900.

[fol. 2745] No. 43—The Cabin Ditch

The ditch is owned by Thomas H. Davy.

Its headgate is located 65 rods west and 16½ rods south from the north-west corner of section 36, T. 10, N. R. 76 W.

It is four feet wide on the bottom, five feet wide on top, one foot deep, has a grade of 15 feet to the mile and carries 7.94 cubic feet of water per second of time. Its capacity is 7.94 cubic feet of water per second of time and it irrigates about 100 acres of land.

It is entitled to Priority No. 47, by construction for 7.94 cubic feet of water per second of time, bearing date, September 16th, 1900.

No. 44—Charles E. Lanning Ditch

The ditch is owned by Charles E. Lanning.

Its headgate is located at a point whence the north-west corner of section 7, T. 8, N. R. 75 W., bears north 40 degrees W. 1355 feet.

It — five feet wide on the bottom, six feet wide on the top and two feet deep; it is 7065 feet long, has grade of 10.50 per mile and its capacity is 15 cubic feet per second of time. It irrigates about 300 acres of land.

It is entitled to Priority No. 48, by construction, for 15 cubic feet of water per second of time, bearing date, June 1st, 1901.

[fol. 2746] No. 45—Forrester Creek Ditch

The ditch is owned by Ernest W. Johnson.

Its headgate is located on the west bank of Forrester creek in the south-east quarter of section 13, T. 11, N. R. 77 W.

It is four feet wide, one foot deep with a grade of 5 feet to the mile and has a carrying capacity of 3.8 cubic feet per second of time. It irrigates 160 acres of land.

It is entitled to Priority, No. 49, by construction, for 3.8 cubic feet of water per second of time, bearing date June 30th, 1901.

No. 46—Homestead Ditch No. 1

It is owned by the estate of August Pache, deceased.

The headgate of the ditch is located on the south bank of Big Jenkins creek from which it draws its supply of water at a point whence the north-east corner of section 25, T. 11, N. R. 77 W., bears N. 60 degrees E. 3343 feet.

It is five — wide on the top, three feet wide on the bottom and two feet deep; its grade is 8 feet to the mile, its length one-half mile and its carrying capacity 5 cubic feet per second of time. It irrigates 80 acres of land.

It is entitled to Priority No. 50, by construction, for 5 cubic feet of water per second of time, bearing date October 22nd, 1901.

[fol. 2747] No. 47—Homestead Ditch No. 2

It is owned by the estate of August Pache, deceased.

The headgate is located on the north bank of Little Jenkins creek, from which it draws its supply of water, at a point whence the south east corner of section 25, T. 11, N. R. 77 W., bears east 2508 feet.

The ditch is three feet wide on top and 1½ feet wide on the bottom; its depth is 15 inches and its grade 8 feet to the mile. Its carrying capacity is 8 cubic feet per second of time. Its length is one half mile. It irrigates 50 acres of land.

It is entitled to Priority No. 51, by construction, for 8 cubic feet of water per second of time, bearing date October 23rd, 1901.

No. 48—Ferguson Ditch

The ditch is owned by Tamerlane Forrester

Its headgate is located at a point whence the south-quarter section corner of section 7, T. 11, N. R. 76 W., bears south 82 degrees 30′ W. 837 feet, on the right bank of the Larimie river.

It is 2½ feet wide at the bottom and 3½ feet wide at the top and 15 inches deep; its length is 3660 with a grade of .6 foot per thousand feet and its capacity is 5 cubic feet per second of time. It irrigates 21 acres of land.

It is entitled to Priority No. 52, by construction, for 5 cubic feet of water per second of time, bearing date December 31st, 1901.

[fol. 2748] No. 21—Lamb Ditch

The ditch is owned by E. M. Pollock and H. W. Pollock.

The ditch, as enlarged is 8 feet wide on the bottom and ten feet wide on the top, 18 inches deep and has a carrying capacity of 18.88 cubic feet per second of time. In May, 1902, the ditch was made four feet wider at the bottom and five feet wider at the top and six inches deeper and its length extended one half mile. By the enlargement 15 cubic feet per second was added to its capacity. As enlarged and extended the ditch will irrigate about 400 acres of land.

No change was made in the location of the headgate by the enlargement and extention.

It is entitled to Priority No. 53, by enlargement and extension, for 15 cubic feet of water per second of time, bearing date May 28th, 1902.

No. 49—The Forrester Ditch No. 2

The ditch is owned by Tamerlane Forrester.

The headgate is located on the right bank of Forrester creek at a point in the N. E. quarter of the N. E. quarter, section 13, T. 11, N. R. 77 W., whence the S. W. corner section 7, T. 11, N. R. 77 W., bears S. 17 degrees 30′ W. 990 feet.

It is 3½ feet wide on top and 3 feet wide on the bottom; 18 inches deep, ½ mile long and its grade is 6 feet to the mile and its carrying capacity four cubic feet per second of time. It irrigates 35 acres of land.

It is entitled to Priority No. 54, by construction, for four cubic feet of water per second of time, bearing date May 30th, 1902.

[fol. 2749] No. 50—Talmage Ditch No. 1

The ditch is owned by C. E. Talmage.

Its headgate is located at a point about 1311 feet southwest from the north-east corner of the northeast quarter of the south-east quarter of section 29, T. 10, N. R. 76 W. It takes its supply of water from McIntyre creek.

It is three feet wide on the top and two feet wide on the bottom; one foot deep and about four hundred yards long; its grade is 26 feet to the mile and its carrying capacity 8 cubic feet per second of time. It irrigates 100 acres of land.

It is entitled to Priority No. 55, by construction, for 8 cubic feet of water per second of time, bearing date, May 31st 1902.

No. 51—Long Park Ditch No. 2

The ditch is owned by John Harris and Charley Shipp.

The headgate is located on the Tight bank of the Laramie river from which it draws its supply of water, at a point about 100 yards west of the quarter corner of section 14, T. 9, N. R. 76 W. Propose to irrigate 200 acres from the ditch which amount is well covered by the ditch.

The ditch is 1½ miles long; three feet wide at the top and 18 inches wide at the bottom; it is two feet deep and has a grade of thirteen feet to the mile and will carry ten cubic feet of water per second of time.

It is entitled to Priority No. 56, by construction, for ten cubic feet of water per second of time, bearing date, June 1st, 1902.

[fol. 2750] No. 52—Nun Creek Ditch

The ditch is owned by Wallie M. Fortune. The headgate is located at a point whence the west quarter corner of section 18, township 9, N. R. 75 W., bears S. 65 degrees 15' W' 3220 feet.

It is 750 feet long and has a grade of 20 feet to the mile; 2 feet wide at bottom four feet at top and 18 inches deep, carrying capacity five cubic feet per second of time. Work was commenced on the ditch on the 8th day of July 1902 and it was completed on the 20th day of July 1902. It takes its water from Nun Creek which is a tributary of Laramie river.

It is entitled to Priority Number 57 by construction for five cubic feet of water per second of time, bearing date July 8th, 1902.

[fol. 2751] No. 53—Lanning and Springer Ditch

The ditch is owned by Stephen Lanning and Eli E. Springer.

The headgate is located in the north bank of Winnifred creek at a point whence the north-east corner section 1, T. 8, N. R. 76 W., bears S. 60 degrees east 1570 feet.

The ditch also cuts Rapid creek one fourth mile distant from its headgate on Winnifred creek from which stream it is also supplied with water. The water of both streams is necessary to supply the ditch. The ditch irrigates 240 acres of land.

The ditch is four feet wide at the top and three feet wide at the bottom and is 18 inches deep; it is 6,200 feet long and has a grade of 25 feet to the mile. Its capacity is 20 cubic feet per second of time—ten cubic feet is claimed.

It is entitled to a Priority No. 58, by construction, for 10 cubic feet of water per second of time, bearing date July 9th, 1902.

[fol. 2752] No. 54—Long Park Ditch

The ditch is owned by James R. Fortune. Wallie M. Fortune, Charles E. Lanning and John McNabb. The headgate is located on the North bank of the Laramie river, from whence it draws it- supply of water at a point whence the S. E. corner of the S. W. quarter of section 24, T. 9, N. R. 76 W., bears N. 29 degrees 15′ E. 475 feet.

The ditch is two miles long, three feet wide at the bottom and five feet wide at the top, two feet deep. Its grade is ten ½ feet to the mile and its carrying capacity ten cubic feet of water per second of time. The ditch was surveyed July 8th 1902 and completed in June, 1905.

It is entitled to priority number 59 for ten cubic feet of water per second of time bearing date July 10th, 1902.

[fol. 2753] Reservoir Findings

No. 2—Porter Lake Reservoir

This reservoir is owned by James R. Fortune and is located on the north-east quarter of the south-east quarter and south-east quarter of the north-east quarter of section 24 T. 9. N. R. 76 W. and has an area of 23.01 acres at its upper contour; and 8.25 at its low water line and water can be stored and drawn off to a depth of 15 feet and has a capacity for storage of 10,140,425 cubic feet; it receives its supply of water from Porter creek, a tributary of the Big Laramie river, through the Porter creek ditch which has a carrying capacity of 10 cubic feet per second of time; the reservoir has been used to irrigate 200 acres of land.

Said reservoir is entitled by original construction, to Priority Number 2, bearing date September 10th, 1902.

The above and foregoing findings upon the twenty-five ditches and one reservoir, concerning which testimony has been offered in this matter and upon which the decree is based, constitute all the special findings of the referee in this proceeding.

J. Mack Mills, Referee.

[fols. 2754 & 2755] IN THE DISTRICT COURT

STATE OF COLORADO,
County of Larimer, ss:

In the Matter of the Adjudication of the Priority of Right to the Use of Water for Irrigation in Water District No. 48, State of Colorado

Decree

Now on this 11th day of October, A. D. 1908, this matter coming on for final hearing and adjudication upon the report of J. Mack Mills, referee appointed herein, to whom this matter was, by order of this Court, herein entered on the 3rd day of February, A. D. 1906, referred for the purposes in said order mentioned, as well upon the several findings upon the evidence produced in this matter, as upon the said evidence taken by and before said referee, and the Court being satisfied, from the several returns of notices, certificates of publication, affidavits and certificates of said referee, respectively, that the said testimony returned, and upon which the findings herein returned have severally been made, was taken upon due and lawful notice, in all respects according to the provisions of the statute in such case made and provided and the rules and several orders of this Court in that behalf in this matter made and entered; and further that the notice of the time set for filing exceptions in this matter to the report and findings, and of the time set for final hearing thereof and this cause, have been duly served on all the parties entitled to notice under the order of this Court in that behalf entered, in manner and form as by said order required; and further, that all interested in this matter and entitled to notice in any stage [fol. 2756] of the proceedings herein, have at all times been duly notified according to law and order of this Court; and the report of the said referee, together with the returns of

service of notices, affidavits, abstract and findings, being found in due form, and the Court having now here in open Court heard all parties and their attorneys so far as they desired to be heard, respectively, touching the several matters herein, it is by the Court, in consideration of the premises, hereby ordered and adjudged that the several findings of the said referee, as reported to and filed in this Court, be in all things approved and confirmed, and that they be taken, deemed and held in all respects as the findings of this Court in this matter; (and further, it is upon like consideration by the Court here ordered, adjudged and decreed in respect to all and singular the said findings of said referee, in respect to each ditch, canal and reservoir in said findings numbered 19, 21, and 31 to 54 inclusive and Reservoir No. 2 as found in Book numbered 11, and as the same are hereinafter mentioned and designated in separate paragraphs hereof as hereinafter in said several paragraphs severally set forth;) subject, however, to the following next mentioned provisions, to-wit:

1. No part of this decree shall in any case be taken, deemed or held to confirm, impair or in any manner effect any claim of right or property held or claimed by any person, or any part thereof, or the land or any part thereof on which any such ditch, canal or reservoir may be situated, or the land held or claimed as a right of way of any of them, or any right, interest or claim of property whatever, in or relating to any of them.

2. No part of this decree shall be taken, deemed or held as affecting in any manner any question or claim of right [fol. 2757] between the owners or claimants of any such ditch, canal or reservoir, as between each other, whether as part owners or shareholders therein, or as stockholders in any corporation or joint stock company claiming or to claim the same or any part thereof, nor shall it affect the rights, interests or claims of any consumers of water for irrigation or domestic purposes, whether as part owner, lessee, shareholder or stockholder in any corporation holding or controlling the same, or as purchasers or water therefrom, as against the rights, interests or claims of any other party or parties interested or claiming interest or rights in or to such ditch, canal or reservoir as owner, lessee or part owner thereof, or as shareholder or stockholder in any cor-

poration claiming the same or as purchaser of water therefrom. Neither shall it affect any claim or priority made or resisted as between parties using water for said purposes from the same ditch, canal or reservoir, as to such water.

3. No part of this decree shall in any manner affect any question between two or more parties claiming or owning priorities as herein adjudged, on the same stream, in any case where the water in such stream sinks and rises to the surface again between the locations of the headgates of their respective ditches or canals, or in any dispute as to the identity of the water appropriated by either party *our* of such sinking and rising stream.

4. This decree shall not effect any question of priority between claimants or owners of ditches or canals used in whole or in part for milling or manufacturing or water power for other purposes as to any water carried in such ditches or canals for said purposes.

5. This decree shall not affect any claim, interest or right of any corporation as to the right of property in any ditch, canal or reservoir, or the ground on which the same may be situated, or any question which may arise between the stockholders thereof or between them and the State, people [fol. 2758] or any party, upon the dissolution of such corporation by expiration of its charter or otherwise, as to any appropriation of water or rights secured by condemnation proceeding by such corporation during its legal existence.

6. No part of this decree shall affect in any way any right, claim or interest now or hereafter held or claimed to any appropriation of water made after the closing of the testimony touching the construction or enlargements of the ditch, canal or reservoir by means of which such appropriation may have been made.

7. No part of this decree shall be taken, deemed or held as adjudging to any claimant or present or future representative of any claim to any ditch or canal or reservoir, or party holding, using or controlling the same, any right to take and carry by means of any ditch, canal or reservoir herein mentioned, or by virtue of any appropriation herein adjudged, any water from any natural stream except to be applied to the use for which such appropriation has been

made; nor to allow any excessive use or waste of water whatever; nor to allow any diversion of water except for lawful and beneficial uses.

8. This decree shall be taken, deemed and held as intended to determine and establish the several priorities of right by appropriation of water from the streams of said Water District No. 48, for irrigation, of the several ditches, canals and reservoirs in said district, concerning which testimony has been offered in this matter, each according to the construction, enlargement or extension thereof, with the amount of water held to have been appropriated thereby.

Subject to the several last mentioned eight provisions it [fol. 2759] is further, as to said ditches, canals and reservoirs, and the several appropriations of water by means of them respectively claimed in this matter, ordered, adjudged and decreed, as in and by the findings of said referee is found, as follows:—

That said ditches be and the same are hereby numbered according to the date of their several and respective constructions, and said dates are hereby determined and declared to be as follows:

Ditch number	Name of ditch	Date appropriation	Priority number
31	LaGarde Ditch No. 1	June 16, 1896	33.
32	Detro Ditch No. 1	June 17, 1896	34.
33	Sand Creek Ditch	June 18, 1896	35.
34	Parker Ditch	Oct. 10, 1896	36.
35	Ben Warren Ditch	July 15, 1897	37.
36	Sand Creek Ditch System	June 15, 1899	38.
37	Spring Creek Ditch No. 1	Apr. 15, 1900	39.
19	Grace Creek Ditch (enlarg.)	Apr. 28, 1900	40.
38	Seepage Ditch No. 2	May 1, 1900	41.
39	Spring Creek Ditch No. 2	May 2, 1900	42.
35	Ben Warren Ditch (enlarg.)	July 15, 1900	43.
40	Brown Ditch	Sept. 10, 1900	44.
41	Springer Ditch	Sept. 11, 1900	45.
42	Davy Ditch	Sept. 15, 1900	46.
43	Cabin Ditch	Sept. 16, 1900	47.
44	Chas. E. Lanning Ditch	June 1, 1901	48.
45	Forrester Creek Ditch	June 30, 1901	49.
46	Homestead Ditch No. 1	Oct. 22, 1901	50.
47	Homestead Ditch No. 2	Oct. 23, 1901	51.
48	Ferguson Ditch	Dec. 31, 1901	52.
21	Lamb Ditch (enlarg.)	May 28, 1902	53.
49	Forrester Creek Ditch No. 2	May 30, 1902	54.
[fol. 2760]			
50	Talmage Ditch No. 1	May 31, 1902	55.
51	Long Park Ditch No. 2	June 1, 1902	56.
52	Nun Creek Ditch	July 8, 1902	57.
53	Lanning & Springer Ditch	July 9, 1902	58.
54	Long Park Ditch	July 10, 1902	59.
	Reservoir		
2	Porter Lake	Sept. 10, 1902	2.

[fol. 2761] No. 31—LaGarde Ditch No. 1

That ditch numbered 31, named the LaGarde Ditch No. 1, Harry Tatham and William Tatham claimants, is a ditch constructed and used for the irrigation of 106 acres of land; it draws its supply of water from LaGarde creek with its headgate upon the right bank of said stream at a point whence the west quarter section corner of section 29, township 11, North, Range 76 West, bears S. 10 degrees 45′ E. 1005 feet, and entitled by appropriation to use of water from said stream to Priority Number 33 by construction thereof and thereby to the quantity of water with the number and date of the priority of appropriation thereof, hereinafter mentioned, for the use aforesaid and for the benefit of the party or parties lawfully entitled thereto; it is hereby adjudged and decreed that there be allowed to flow into said ditch from said stream for the use and benefit aforesaid under and by virtue of said appropriation by construction, Priority Number 33, fifteen and four tenths cubic feet of water per second of time, or so much thereof as may be necessary to irrigate one hundred and six acres of land, the appropriation of which water took effect on, and said priority dates from the 16th day of June, A. D. 1896.

[fol. 2762] No. 32—Detro Ditch No. 1

That ditch numbered thirty-two, named Detro Ditch No. 1, J. H. Detro, claimant, is a ditch constructed and used to irrigate twenty-eight acres of land. It draws its supply of water from Forrester creek with its headgate on the left bank of said stream at a point whence the south-east corner of section twelve, township eleven, North, Range 77 W., bears S. 35 degrees and 50′ W. 1320 feet, and entitled by appropriation to use of water from said stream to Priority Number thirty-four, by construction thereof, and thereby to the quantity of water with the number and date of priority of appropriation thereof, hereinafter mentioned, for the use aforesaid and for the benefit of the party or parties lawfully entitled thereto; it is hereby adjudged and decreed that there be allowed to flow into said ditch from said stream, for the use and benefit aforesaid under and by virtue of said appropriation by construction, Priority Number thirty-four, five cubic feet of water per

second of time, or so much thereof as may be necessary to irrigate twenty eight acres of land, the appropriation of which water took effect on, and said priority dates from the 17th day of June, A. D. 1896.

[fol. 2763] No. 33—Sand Creek Ditch (Modified Decree)

That ditch numbered thirty-three, named the Sand Creek Ditch, August Wurl, claimant, is a ditch constructed and used to irrigate three hundred and fifty-one acres of land, and to supply Seepage Ditch Number 2, Spring Creek Ditch Number 1 and Spring Creek Ditch Number 2 with water from Sand Creek for the irrigation of lands lying under said ditches; it draws its supply of water from Sand Creek with its headgate located on the left bank of said stream at a point whence the south quarter corner of Section 10, Township 11, N. R. 75 W., bears south 60 degrees, 10 minutes W. 1880 feet, and entitled by appropriation to use of water from said stream to priority Number Thirty-five, by construction thereof, and thereby to the quantity of water, with the number and date of the priority of the appropriation thereof, hereinafter mentioned, for the use aforesaid and for the benefit of the party or parties lawfully entitled thereto; it is hereby adjudged and decreed that there be allowed to flow into said ditch from said stream, for the use and benefit aforesaid under and by virtue of said appropriation by construction, Priority Numbered Thirty-five, eight and three tenths cubic feet of water per second of time, or so much thereof as may be necessary to irrigate three hundred and fifty-one acres of land, the appropriation of which water took effect on, and said priority dates from the 18th day of June, A. D. 1896.

[fol. 2764] No. 34—Parker Ditch

That ditch numbered 34, named the Parker Ditch, Thomas H. Davy and A. deV. Baldwin, claimants, is a ditch constructed and used to irrigate one hundred and sixty acres of land; it draws its supply of water from the Laramie river with headgate upon the right bank of said stream at a point whence southeast quarter of north-east quarter corner section 26, township 10 North, Range 76 W., bears north-easterly 300 feet, and entitled by appropriation to use water from said stream to Priority Number

thirty-six, by construction thereof, and thereby to the quantity of water with the number and date of the priority of the appropriation thereof, hereinafter mentioned, for the use aforesaid and for the benefit of the party or parties lawfully entitled thereto; it is hereby adjudged and decreed that there be allowed to flow into said ditch from said stream, for the use and benefit aforesaid, under and by virtue of said appropriation by construction, Priority Number thirty-six, fourteen and one-tenth cubic feet of water per second of time, or so much thereof as may be necessary to irrigate one hundred and sixty acres of land, the appropriation of which water took effect on, and said priority dates from the 10th day of October, A. D. 1896.

[fol. 2765] No. 35—Ben Warren Ditch

That ditch numbered 35, named Ben Warren Ditch, Thos. H. Davy, claimant, is a ditch constructed and used to irrigate one hundred acres of land; it draws its supply of water from a branch of the Big Larimer river, with its head gate located on the north bank of said branch at a point in the north-west quarter of the southwest quarter of section 25, T. 9, N. R. 76 W. It is entitled by appropriation to use of water from said stream to Priority No. 37 by construction thereof and thereby to the quantity of water with the number and date of the priority of appropriation thereof, hereinafter mentioned, for the use aforesaid and for the benefit of the party or parties lawfully entitled thereto: It is hereby adjudged and decreed that there be allowe- to flow into said ditch from said stream for the use and benefit aforesaid under and by virtue of said appropriation by construction, Priority Number 37, 4.22 cubic feet of water per second of time, or so much thereof as may be necessary to irrigate one hundred acres of land, the appropriation of which water took effect on, and said priority dates from the 15th day of July, A. D. 1897.

And further that said ditch is entitled by appropriation to use of water from said stream to Priority Number 43 by enlargement thereof and thereby to the quantity of water with the number and date of the priority of appropriation thereof, hereinafter mentioned, for the use aforesaid and for the benefit of the party or parties lawfully entitled thereto; it — hereby adjudged and decreed that there be allowed to flow into said ditch from said stream for the

use and benefit aforesaid, under and by virtue of said appropriation by enlargement, Priority Number 43, 3.28 cubic feet of water per second of time, or so much thereof as may be necessary to irrigate one hundred acres of land, the appropriation of which water took effect on, and said priority dates from the 15th day of July, A. D. 1900.

[fol. 2766] No. 36—The Sand Creek Ditch System

That ditch numbered thirty-six, named the Sand Creek Ditch System, The Divide Canal and Reservoir Company, claimant, is a ditch constructed and used for the irrigation of fifty thousand acres of land, through the use of the natural channels of Sand Creek, Sheep Creek and the Cache la Poudre River and storage reservoirs belonging to the system; it draws its supply of water from Columbine Creek and its tributaries, from Deadman Creek and its tributaries and from Sand Creek and its tributaries, all of said streams being tributaries of the Laramie River, by means of ditches formerly known as Columbine Ditch, which has its headgate at one of the branches of Columbine Creek and discharges its waters into Deadman ditch, and Deadman ditch which draws its supply of water from Columbine ditch and Deadman Creek and discharges into the head of Sand Creek at a point whence the north-west corner of section 16, is north 7 degrees 25′ west 2100 feet from the north end of Deadman ditch at the point that it empties into Sand Creek, and a ditch connecting Sand Creek with Sheep Creek, with its headgate at a point south 84° 45′ east 560 feet from the south quarter corner of section 22, township 11, North Range 75 W., discharging its waters into Sheep Creek at a point north 10°—25′ east 500 feet from the north quarter corner of section 23, T. 11, N. R. 75 W., which said Sheep Creek is a branch of the Cache la Poudre River into which it discharges all the waters of the system and through which it is carried to distributing ditches and reservoirs; it is entitled by appropriation to use of water from said streams to Priority Number thirty-eight, by construction thereof, and thereby to the quantity of water with the number and date of the priority of the appropriation thereof, [fol. 2767] hereinafter mentioned, for the use aforesaid and for the benefit of the party or parties lawfully entitled thereto; it is hereby adjudged and decreed that there be allowed to flow into said ditch from said streams, for the

use and benefit aforesaid, under and by virtue of said appropriation by construction, Priority Number thirty-eight, two hundred and eighty-eight cubic feet of water per second of time, or so much thereof as may be necessary to irrigate fifty thousand acres of land, the appropriation of which water took effect on and said priority dates from the 15th day of June, A. D. 1899.

[fol. 2768] No. 37—Spring Creek Ditch No. 1 (Modified Decree)

That ditch numbered Thirty-seven, named Spring Creek Ditch No. 1, August Wurl, claimant, is a ditch constructed and used to irrigate 69 acres of land; it draws its supply of water from Sand Creek with its headgate on the left bank of Spring Creek, at a point whence the south-west quarter corner section twenty-six, township 12, N. R. 75 W., bears south 64 degrees W. 1941 feet, which said Spring Creek receives said supply of water from Sand Creek through and by means of Sand Creek Ditch, Number 33, and entitled by appropriation to use of water from Sand Creek to Priority Numbered Thirty-nine, by construction thereof, and thereby to the quantity of water with the number and date of the priority of the appropriation thereof, hereinafter mentioned, for the use aforesaid and for the benefit of the party or parties lawfully entitled thereto; it is hereby adjudged and decreed that there be allowed to flow into said Sand Creek Ditch from Sand Creek and through said Sand Creek ditch into the channel of Spring Creek, for the use and benefit aforesaid, under and by virtue of said appropriation by construction, Priority Number Thirty-nine, two and seven-tenths cubic feet of water per second of time, or so much thereof as may be necessary to irrigate sixty-nine acres of land, the appropriation of which water took effect on and said priority dates from the 15th day of April, A. D. 1900.

[fol. 2769] No. 38—Seepage Ditch No. 2 (Modified Decree)

That ditch numbered Thirty-seven, named Seepage Ditch No. 2, August Wurl, Claimant, is a ditch constructed and used to irrigate six hundred and twenty-one acres of land; it draws its supply of water from Sand Creek with its headgate located on the left bank of Spring Gulch at a

point whence the south quarter section corner section 35, township 12, North Range 75 W., bears south 11 degrees W. 1386 feet, which said Spring Gulch receives said supply of water from Sand Creek through and by means of Sand Creek Ditch No. 33, and entitled by appropriation to use of water from said Sand Creek to Priority Numbered Forty-one, by construction thereof, and thereby to the quantity of water with the number and date of priority of appropriation thereof, hereinafter mentioned, for the use aforesaid and for the benefit of the party or parties lawfully entitled thereto; it is hereby Adjudged and Decreed there be allowed to flow into Sand Creek Ditch from Sand Creek, and through said Sand Creek ditch into Spring Gulch and into and through said Seepage Ditch No. 2 for the use and benefit aforesaid, under and by virtue of said appropriation by construction, Priority Number Forty-one, five and eighty-five one-hundredths cubic feet of water per second of time, or so much thereof as may be necessary to irrigate six hundred and twenty-one acres of land, the appropriation of which water took effect on and said priority dates from the first day of May, A. D. 1900.

[fol. 2770] No. 19—Grace Creek Ditch

That ditch numbered nineteen, Ernest W. Johnson claimant, named Grace Creek Ditch, is a ditch constructed and enlarged to irrigate two hundred and thirty acres of land; it draws its supply of water from Grace Creek with its headgate on the left bank of said stream at a point whence the north-west (quarter) corner of section 14, township 11, North Range 77 W., bears S. 37 degrees 45′ E. 574 feet, and entitled by appropriation to use of water from said stream to Priority Number Forty by enlargement thereof and thereby to the quantity of water with the number and date of the priority of the appropriation by enlargement thereof, hereinafter mentioned, for the use aforesaid and for the benefit of the party or parties lawfully entitled thereto; it is hereby adjudged and decreed that there be allowed to flow into said ditch from said stream for the use and benefit aforesaid, under and by virtue of said appropriation by enlargement, Priority Number Forty, six and three tenths cubic feet of water per second of time, or so much thereof as may be necessary to irrigate two hundred and thirty acres of land, the appropriation of which water took effect

on, and said priority dates from the 28th day of April, A. D. 1900.

[fol. 2771] No. 39—Spring Creek Ditch No. 2 (Modified Decree)

That ditch numbered thirty-nine, named Spring Creek Ditch No. 2, August Wurl claimant, is a ditch constructed and used to irrigate 76 acres of land; it draws its supply of water from Sand Creek with its headgate located on the left bank of Spring Creek at a point whence the south quarter section corner of section 23, township 12, N. R. 75 W., bears S. 22 degrees W. 853 feet, which said Spring Creek receives said supply of water from Sand Creek through and by means of Sand Creek Ditch No. 33, and entitled by appropriation to use of water from Sand Creek to priority number forty-two by construction thereof, and thereby to the quantity of water with the number and date of the appropriation thereof, hereinafter mentioned, for the use aforesaid and for the benefit of the party or parties lawfully entitled thereto; it is therefore Adjudged and Decreed that there be allowed to flow into Sand Creek ditch from Sand Creek and through said Sand Creek ditch into the channel of Spring Creek and into and through Spring Creek Ditch No. 2 for the use and benefit aforesaid, under and by virtue of said appropriation by construction, Priority Numbered Forty-two, six and six-tenths cubic feet of water per second of time, or so much thereof as may be necessary to irrigate seventy-five acres of land, the appropriation of which water took effect on, and said priority dates from, the 2nd day of May, A. D. 1900.

[fol. 2772] No. 40—The Brown Ditch

That ditch numbered forty, named the Brown Ditch, James R. Fortune owner, is a ditch which draws its supply of water from Porter Creek, a tributary of the Big Laramie River, and is constructed and used to irrigate one hundred and sixty acres of land, with its headgate located on Porter Creek at a point whence the north-west corner of section twenty-four, township nine North, Range seventy-six west, bears north sixty-four degrees and twenty-six minutes west

one thousand six hundred and ninety-five feet, and entitled by appropriation to use of water from said stream to Priority Number Forty-four by construction thereof, and thereby to the quantity of water with the number and date of the priority of the appropriation thereof, hereinafter mentioned, for the use aforesaid and for the benefit of the party or parties lawfully entitled thereto; it is therefore hereby adjudged and decreed that there be allowed to flow into said ditch from said stream, for the use and benefit aforesaid, under and by virtue of said appropriation by construction, Priority Number Forty-four, fifteen and nine-tenths cubic feet of water per second of time, or so much thereof as may be necessary to irrigate one hundred and sixty acres of land, the appropriation of which water took effect on, and said priority dates from the tenth day of September, A. D. 1900.

[fol. 2773] No. 41—Springer Ditch

That ditch numbered forty-one, named the Springer Ditch, Thomas H. Davy and E. E. Springer claimants, is a ditch which draws its supply of water from the Larimie River with its headgate located on the east bank of said river in the south-east quarter of section thirty-nine, township nine North, Range seventy-six west, and is used to irrigate one hundred and forty acres of land, and is entitled by appropriation by construction to use of water from said stream to Priority Number Forty-five, by construction thereof, and thereby to the quantity of water with the number and date of the priority of the appropriation thereof, hereinafter mentioned, for the use aforesaid and for the benefit of the party or parties lawfully entitled thereto; it is therefore hereby adjudged and decreed that there be allowed to flow into said ditch from said stream, for the use and benefit aforesaid, under and by virtue of said appropriation by construction, Priority Number Forty-five, eight cubic feet of water per second of time or so much thereof as may be necessary to irrigate one hundred and forty acres of land, the appropriation of which water took effect on and said priority dates from the 11th day of September, A. D. 1900.

[fol. 2774] No. 42—The Davy Ditch

That ditch numbered forty-two, named the Davy Ditch, Thomas H. Davy claimant, is a ditch constructed and used to irrigate three hundred and twenty-five acres of land, with its headgate located on the north bank of Dead Man Creek, from whence it draws its supply of water, at a point whence the south-east corner of section 36, township 10, N. R. 76 W., bears south 46 degrees and 24' E. 958.8 feet and is entitled by appropriation to use of water from said stream to Priority Number Forty-six, by construction thereof, and thereby to the quantity of water with the number and date of the priority of the appropriation thereof, hereinafter mentioned, for the use aforesaid and for the benefit of the party or parties lawfully entitled thereto, it is hereby adjudged and decreed that there be allowed to flow into said ditch from said stream, for the use and benefit aforesaid, under and by virtue of said appropriation by construction, Priority Number Forty-six, twenty cubic feet of water per second of time, or so much thereof as may be necessary to irrigate three hundred and twenty-five acres of land, the appropriation of which water took effect on and said priority dates from the 15th day of Sept., A. D. 1900.

[fol. 2775] No. 43—The Cabin Ditch

That ditch numbered forty-three named the Cabin Ditch, Thomas H. Davy, claimant, is a ditch constructed and used to irrigate one hundred acres of land; it draws its supply of water from Stub creek with headgate located upon the south bank of said stream at a point sixty-five rods west and sixteen and one-half rods south from the northwest corner of section 36, township 10, N. R. 76 W., and entitled by appropriation to use of water from said stream to Priority Number Forty-seven, by construction thereof, and thereby to the quantity of water with the number and date of the appropriation thereof, hereinafter mentioned, for the use aforesaid and for the benefit of the party or parties lawfully entitled thereto; it is hereby adjudged and decreed that there be allowed to flow into said ditch from said stream, for the use and benefit aforesaid, under and by virtue of said appropriation by construction, Priority Number Forty-seven, seven and ninety-four one-hundredths

cubic feet of water per second of time, or so much thereof as may be necessary to irrigate one hundred acres of land, the appropriation of which water took effect on and said priority dates from the 16th day of September, A. D. 1900.

[fol. 2776] No. 44—Charles E. Lanning Ditch

That ditch numbered forty-four, named the Charles E. Lanning ditch, Charles E. Lanning claimant, is a ditch constructed and used to irrigate three hundred acres of land; it draws its supply of water from the west bank of the Larimer river with headgate located at a point whence the northwest corner of section 7., T. 8, N. R. 75 W., bears north forty degrees west 1355 feet, and entitled by appropriation to use of water from said stream to Priority Number Forty-eight by construction thereof, and thereby to the quantity of water with the number and date of the priority of the appropriation thereof, hereinafter mentioned, for the use aforesaid and for the benefit of the party or parties lawfully entitled thereto; it — hereby adjudged and decreed that there be allowed to flow into said ditch from said stream, for the use and benefit aforesaid, under and by virtue of said appropriation by construction, Priority Number Forty-eight, fifteen cubic feet of water per second of time, or so much thereof as may be necessary to irrigate three hundred acres of land, the appropriation of which water took effect on and said priority dates from the 1st day of June, A. D. 1901.

[fol. 2777] No. 45—Forrester Creek Ditch

That ditch numbered forty-five, named the Forrester Creek Ditch, Ernest W. Johnson, claimant, is a ditch constructed and used to irrigate one hundred and sixty acres of land; it draws its supply of water from Forrester creek, with its headgate upon the west bank of said stream located in the southeast quarter of section 13, township 11 north, Range 77 W., and entitled by appropriation to use of water from said stream to Priority Number Forty-nine, by construction thereof, and thereby to the quantity of water with the number and date of the priority of appropriation thereof, hereinafter mentioned, for the use and benefit aforesaid and for the benefit of the party or parties lawfully entitled thereto; it is hereby adjudged and decreed

that there be allowed to flow into said ditch from said stream, for the use and benefit aforesaid, under and by virtue of said appropriation by construction, Priority Number Forty-nine, three and eight tenths cubic feet of water per second of time, or so much thereof as may be necessary to irrigate one hundred and sixty acres of land, the appropriation of which water took effect on and said priority dates from the 30th day of June, A. D. 1901.

[fol. 2778] No. 46—Homestead Ditch No. 1

That ditch numbered forty-six, named Homestead Ditch No. 1 Abbie Vuagniaux, as widow of August Pache, deceased, claimant, is a ditch constructed and used to irrigate eighty acres of land; it draws its supply of water from Big Jenkins creek with its headgate located on the south bank of said stream at a point whence the northeast corner of section 25, T. 11, N. R. 77 W., bears N. 60 degrees E. 3343 feet, and entitled by appropriation to use of water from said stream to Priority Number Fifty, by construction thereof, and thereby to the quantity of water with the number and date of the priority of the appropriation thereof, hereinafter mentioned, for the use aforesaid and for the benefit of the party or parties lawfully entitled thereto; it is hereby adjudged and decreed that there be allowed to flow into said ditch from said stream, for the use and benefit aforesaid, under and by virtue of said appropriation by construction, Priority Number Fifty, five cubic feet of water per second of time, or so much thereof as may be necessary to irrigate eighty acres of land, the appropriation of which water took effect on and said priority dates from the 22nd day of October, A. D. 1901.

[fol. 2779] No. 47—Homestead Ditch No. 2

That ditch numbered forty-seven, named Homestead Ditch No. 2, Abbie Vuagniaux, as widow of August Pache, deceased, claimant, is a ditch constructed and used to irrigate fifty acres of land; it draws its supply of water from Little Jenkins creek with its headgate on the north bank of said stream at a point whence the southeast corner of section 25, T. 11, N. R. 77 W., bears east 2508 feet, and entitled by appropriation to use of water from said stream to Priority Number Fifty-one, by construction thereof, and

thereby to the quantity of water with the number and date thereof, hereinafter mentioned, for the use aforesaid and for the benefit of the party or parties lawfully entitled thereto; it is hereby adjudged and decreed that there be allowed to flow into said ditch from said stream, for the use and benefit aforesaid, under and by virtue of said appropriation by construction, Priority Number Fifty-one, eight cubic feet of water per second of time, or so much thereof as may be necessary to irrigate fifty acres of land, the appropriation of which water took effect on and said priority dates from the 23rd day of October, A. D. 1901.

[fol. 2780] No. 48—Ferguson Ditch

That ditch numbered forty-eight, named the Ferguson Ditch, Tamerlane Forrester, claimant, is a ditch constructe- and used to irrigate twenty-one acres of land; it draws its supply of water from the Laramie river with its headgate located on the right bank of said stream at a point whence the south quarter section corner of section seven T. 11, N. R. 76 W., bears S. 82 degrees 30′ W. 837 feet, and entitled by appropriation to use of water from said stream to Priority Number Fifty-two, by construction thereof, and thereby to the quantity of water with the number and date of the priority of the appropriation thereof, hereinafter mentioned, for the use aforesaid and for the benefit of the party or parties lawfully entitled thereto; it is hereby adjudged and decreed that there be allowed to flow into said ditch from said stream, for the use and benefit aforesaid, under and by virtue of said appropriation by construction, Priority Number Fifty-two, five cubic feet of water per second of time, or so much thereof as may be necessary to irrigate twenty-one acres of land, the appropriation of which water took effect on and said priority dates from the 31st day of December, A. D. 1901.

[fol. 2781] No. 21—The Lamb Ditch

That ditch numbered twenty-one, named the Lamb Ditch, H. W. Pollock and E. M. Pollock, claimants, is a ditch constructed and enlarged and used to irrigate four hundred and thirty acres of land; it draws its supply of water from McIntyre creek, a tributary of the Big Laramie river, with headgate upon the right bank of said stream and situated

North 15 degrees and 45′ east 2196 feet from southwest corner of section 5, Township 10 North, Range 76 W., and entitled by appropriation to use of water from said stream to Priority Number Fifty-three, by enlargement thereof and thereby to the quantity of water with the number and date of the priority of the appropriation by enlargement thereof, hereinafter mentioned, for the use aforesaid and for the benefit of the part yor parties lawfully entitled thereto; it is hereby adjudged and decreed that there be allowed to flow into said ditch from said stream for the use and benefit aforesaid, under and by virtue of said appropriation by enlargement, Priority Number Fifty-three, fifteen cubic feet of water per second of time, or so much thereof as may be necessary to irrigate four hundred and thirty acres of land, the appropriation of which water took effect on and said priority dates from the 28th day of May, A. D. 1902.

[fol. 2782] No. 49—The Forrester Creek Ditch No. 2

That ditch numbered forty-nine, named Forrester creek ditch No. 2, Tammerlane Forrester, claimant, is a ditch constructed to irrigate thirty-five acres of land; it draws its supply of water from Forrester creek with its headgate located on the right bank of said stream at a point whence the southwest corner of section 7, T. 11 N., R. 76 W., bears S. 17 degrees 30′ W. 990 feet, and entitled by appropriation to use of water from said stream to Priority Number Fifty-four, by construction thereof, and thereby to the quantity of water with the number and date of the priority of the appropriation thereof, hereafter mentioned, for the use aforesaid and for the benefit of the party or parties lawfully entitled thereto; it is hereby adjudged and decreed that there be allowed to flow into said ditch from said stream, for the use and benefit aforesaid, under and by virtue of said appropriation by construction, Priority Number Fifty-four, four cubic feet of water per second of time, or so much thereof as may be necessary to irrigate thirty-five acres of land, the appropriation of which water took effect on and said priority dates from the 30th day of May, A. D. 1902.

[fol. 2783] No. 50—Talmage Ditch No. 1

That the ditch numbered fifty, named the Talmage Ditch No. 1, C. E. Talmage claimant, is a ditch constructed and

used to irrigate one hundred acr-s of land; it draws its supply of water from McIntyre creek with its headgate located at a point about 1,311 feet from the north-east corner of the northeast of the south-east quarter of section 29, township 10, N. R. 76 W., and about due southwest from said described corner, and entitled by appropriation to the use of water from said stream to Priority Number Fifty-five, by construction thereof, and thereby to the quantity of water and the number and date of the priority of the appropriation thereof, hereinafter mentioned, for the use aforesaid and for the benefit of the party or parties lawfully entitled thereto; it is hereby adjudged and decreed that there be allowed to flow into said ditch from said stream, for the use and benefit aforesaid, under and by virtue of said appropriation by construction, Priority Number Fifty-five, eight cubic feet of water per second of time, or so much thereof as may be necessary to irrigate one hundred acres of land, the appropriation of which water took effect on, and said priority dates from the 31st day of May, A. D. 1902.

[fol. 2784] No. 51—Long Park Ditch No. 2

That ditch numbered fifty-one, named Long Park Ditch No. 2, John Harris and Charley Ship, claimants, is a ditch constructed and used to irrigate two hundred acres of land; it draws its supply of water from the Laramie river with its headgate located on the right bank of said stream at a point about one hundred yards west of the quarter corner of section 14, T. 9, N. R. 76 W., and entitled by appropriation to the use of water from said stream to Priority Number Fifty-six, by construction thereof, and thereby to the quantity of water with the number and date of the priority of appropriation thereof, hereinafter mentioned, for the use and benefit aforesaid and for the benefit of the party or parties lawfully entitled thereto; it is hereby adjudged and decreed that there be allowed to flow into said ditch from said stream, for the use and benefit aforesaid, under and by virtue of said appropriation by construction, Priority Number Fifty-six, ten cubic feet of water per second of time, or so much thereof as may be necessary to irrigate two hundred acres of land, the appropriation of which water took effect on and said priority dates from the 1st day of June, A. D. 1902.

[fol. 2785] No. 52—Nun Creek Ditch

That ditch numbered fifty-two, named Nun Creek Ditch, Wallie M. Fortune, claimant, is a ditch constructed and used to irrigate 160 acres of land; it draws its supply of water from Nun Creek with headgate located at a point whence the west quarter corner of section 18, township 9, N. R. 75 W., bears S. 65 degrees 15' W. 3220 feet, and entitled by appropriation to the use of water from said stream to Priority Number Fifty-seven, by construction thereof, and thereby to the quantity of water with the number and date of the priority of the appropriation thereof, hereinafter mentioned, for the use aforesaid and for the benefit of the party or parties lawfully entitled thereto; it is hereby adjudged and decreed that there be allowed to flow into said ditch from said stream, for the use and benefit aforesaid, under and by virtue of said appropriation by construction, Priority Number Fifty-seven, five cubic feet of water per second of time, or as much thereof as may be necessary to irrigate one hundred and sixty acres of land, the appropriation of which water took effect on, and said priority dates from the 8th day of July, A. D. 1902.

[fol. 2786] No. 53—Lanning and Springer Ditch

That ditch numbered fifty-three, named the Lanning and Springer Ditch, Stephen Lanning and Eli E. Springer, claimants, is a ditch constructed and used to irrigate two hundred and forty acres of land; it draws its supply of water from Winifred Creek and Rapid Creek with its head gate upon the north bank of said stream (Winifred creek) at a point whence the N. E. corner section 1, T. 8 N., R. 76 W., bears S. 60 degrees east 1570, from whence the ditch cuts across Rapid creek, taking the water from said creek, about a quarter mile from said headgate, and is entitled by appropriation to the use of water from said streams to Priority Number Fifty-eight, by construction thereof, and thereby to the quantity of water with the number and date of the priority of appropriation thereof, hereinafter mentioned, for the use aforesaid and for the benefit of the party or parties lawfully entitled thereto; it is hereby adjudged and decreed that there be allowed to flow into said ditch from said streams, for the use and benefit aforesaid, under and by virtue of said appropria-

tion by construction, Priority Number Fifty-eight, ten cubic feet of water per second of time, or so much thereof as may be necessary to irrigate two hundred and forty acres of land, the appropriation of which water took effect on and said priority dates from the 9th day of July, A. D. 1902.

[fol. 2787] No. 54—Long Park Ditch

That ditch numbered fifty-four, named the Long Park Ditch, James R. Fortune, Wallie M. Fortune, Charles E. Lanning and John McNabb, claimants, is a ditch constructed and used to irrigate three hundred and fifty acres of land; it draws its supply of water from the north bank of the Big Laramie river with its headgate located at a point whence the south-east corner of the south-west quarter of section 24, T. 9, N. R. 76 W., bears N. 29 degrees 15' E. 475 feet and is entitled by appropriation to the use of water from said stream to Priority Numbered Fifty-nine, by construction thereof, and thereby to the quantity of water with the number and date of the priority of the appropriation thereof, hereinafter mentioned, for the use aforesaid and for the benefit of the party or parties lawfully entitled thereto; it is hereby adjudged and decreed that there be allowed to flow into said ditch from said stream, for the use and benefit aforesaid, under and by virtue of said appropriation by construction, Priority Number Fifty-nine, ten cubic feet of water per second of time, or so much thereof as may be necessary to irrigate three hundred and fifty acres of land, the appropriation of which water took effect on and said priority dates from the 10th day of July, A. D. 1902.

[fol. 2788] Reservoir Decree

No. 2—Porter Lake Reservoir

That reservoir numbered 2, named Porter Lake, James R. Fortune claimant, is a reservoir constructed to irrigate two hundred acres of land; it is located on the northeast quarter of the southeast quarter and the southeast quarter of the northeast quarter of section 24, township 9, north of Range 76 W. It takes its supply of water from Porter Creek through the Porter Creek Ditch and is entitled to

one appropriation of water for the purpose of filling said reservoir from said stream to Priority Number Two, by construction thereof and thereby entitled to the quantity of water with the number and date of the priority of the appropriation thereof, hereinafter mentioned, for the use aforesaid and for the benefit of the party or parties lawfully entitled thereto; it is hereby adjudged and decreed that the said reservoir be allowed to have stored in it from Porter creek by means of the ditch aforesaid and for the benefit of the party or parties aforesaid under and by virtue of said appropriation by construction Priority No Two so much water as is necessary to fill said reservoir to a depth of fifteen feet above its lower contour with a capacity of 10,140,425 cubic feet of water and an area at its upper contour of 23.01 acres, which appropriation of water for storage purposes took effect on, and dates from the 10th day of September, A. D. 1902.

[fol. 2789] And it is further ordered, adjudged and decreed that all of those said appropriations of water hereby found and adjudged to have been so as aforesaid made from the water of the said Laramie river (or Big Laramie river) and of its said several tributaries, and numbered in order of priority of the time of their severally taking effect, appropriations by enlargement of ditches numbered nineteen and twenty-one and by original construction of priorities numbered from thirty-three to fifty-nine, inclusive, as above set forth and in the several paragraphs of this decree, are to be taken, held and enjoyed for the uses in said paragraphs, severally and respectively, to each said appropriation set forth, and priority of right in manner and order as aforesaid.

And it is further ordered, adjudged and decreed that the foregoing award and allowance of water to flow into each of said ditches in this decree mentioned and numbered as aforesaid, and said reservoir, is subject to and shall be allowed to flow into each of said ditches and feeders in accordance with the above mentioned priorities, and that all Water Commissioners and their assistants or other officers whose duty it is or may be to make or cause to be made a distribution of water for irrigation among the several ditches and feeders of reservoirs, hereinabove mentioned, shall at all times in making such distribution, observe and maintain the aforesaid order of priority among

all said ditches and feeders, and distribute water accordingly.

And it is further ordered that the costs of the Clerk of this court shall be prorated among the several claimants.

By the Court.

James E. Garrigues, Judge.

Dated this 11th day of October, 1906.

[fol. 2790] STATE OF COLORADO,
County of Larimer, ss:

I, W. P. Hurley, Clerk of the District Court, of the Eighth Judicial District of the State of Colorado within and for Larimer County, do hereby certify the foregoing to be a true, perfect and complete copy of Findings and Decree "In the Matter of the Adjudication of Priority of Right to the Use of Water for Irrigation in Water District No. 48, State of Colorado," in Case No. 1885 entered on the 11th day of October, 1906.

In testimony whereof I have hereunto set my hand and affixed the seal of said Court, at my office in Fort Collins, Colorado, this 22nd day of May, A. D. 1933.

W. P. Hurley, Clerk. (Seal.)

STATE OF COLORADO,
County of Larimer, ss:

I, Claude C. Coffin, Judge of the District Court of the Eighth Judicial District of the State of Colorado within and for the County of Larimer, do hereby certify that W. P. Hurley, whose name is subscribed to the foregoing Certificate of Attestation, now is, and was, at the time of signing and sealing the same, Clerk of the District Court of Larimer County aforesaid, and keeper of the Records and seal thereof, duly appointed and qualified to office; that full faith and credit are and of right ought to be given to all his official acts as such in all Courts of Record and elsewhere; and that his said attestation is in due form of law, and by the proper officer.

Given under my hand and seal this 22nd day of May, A. D. 1933.

Claude C. Coffin. (Seal.)

STATE OF COLORADO,
County of Larimer, ss:

I, W. P. Hurley, Clerk of the District Court of the Eighth Judicial District of the State of Colorado, within and for Larimer County, do hereby certify that —— ——, whose genuine signature is appended to the foregoing certificate, was, at the time of signing the same, Judge of the District Court of Larimer County, of the State of Colorado, duly commissioned and qualified; that full faith and credit are and of right ought to be given to all his official acts as such, in all Courts of Record, and elsewhere.

In testimony whereof I have hereunto set my hand and affixed the seal of said Court, at my office in — Colo., this 22nd day of May, A. D. 1933.

W. P. Hurley, Clerk. (Seal.)

No. 20—The Laramie River Reservoir.

The Ditches and Reservoirs in said Water District are numbered as above, and in the decree submitted herewith, are placed in the order of their priority as established by the decree rendered herein.

The Referee finds that owing to geological and geographical conditions, in the irrigation of the lands to meadow in the Laramie River Valley and in Water District #48, it has been necessary for the several appropriators to divert and distribute water through and by means of the several ditches and reservoirs taking water from said stream and its tributaries in quantities largely in excess of that ordinarily required for the irrigation of the relatively small areas situate beneath and irrigated from said several ditches and reservoirs, and that the major portion of the waters so diverted and distributed over said lands, immediately return to the stream or water course adjacent to said lands, and that thereafter the said water so returning and going to make up a portion of the waters of the stream, is rediverted and distributed and returned in like manner by the ditches lower down the stream.

[fol. 2793] The Referee finds that the use of water in the Laramie River Valley in Colorado, at all times heretofore has been and now is limited to the irrigation of meadow lands, and that such use has been made and the water applied beneficially for irrigation purposes only during a period of about 60 days in each year occurring subsequent to the 15th day of May and prior to the 1st day of August, except in occasional instances where use has been made for a short period following the 1st day of August in the irrigation of sage brush lands for the purpose of aiding the clearing and preparation of such lands for meadow purposes.

Each and every of the foregoing general findings shall be deemed to apply to each and every ditch and reservoir diverting and applying water to lands situate in water District #48, and shall be deemed to have been included in and made a part of the separate findings and decree of each of said ditches and reservoirs without specific mention or repetition therein.

[fol. 2794] The Laramie River System of the Greeley-Poudre Irrigation District

The Greeley-Poudre Irrigation District, a quasi-public or municipal corporation, duly organized under the laws of

the State of Colorado, is the owner and claimant herein of a general system of ditches, reservoirs and a tunnel now in process of construction in Water District No. 48, for the diversion, storage and conveyance of waters of the Laramie River and tributaries to the Cache la Poudre River, whence the same will be diverted into and carried, stored, and distributed and applied by means of a system of ditches and reservoirs in Larimer and Weld Counties, owned by the District, for the irrigation of 125,000 acres of land in Tps. 7 and 8 North, Range Sixty seven West; Townships 7, 8, and 9 North, Range sixty six West; Townships 6, 7, 8 and 9 North, Range sixty four West; Townships 6, 7, 8 and 9 North, Range Sixty three West, and Townships 7 and 9 North, Range Sixty two West of the 6th P. M.; all in Weld County, Colorado, which lands go to make up and do constitute The Greeley-Poudre Irrigation District. The system of works, in Water District No. 48, shall be hereinafter designated in this and special findings as the "Laramie River System" of claimant and consists of the following several units, each of which is to a greater or less degree interdependent upon the other units operated therewith, all of which, working either alone or in conjunction one with another, constitute a complete system of works, the operation of each and all of the several units being necessary for the diversion and storage of water by the entire system:

The Rawah Ditch;
The Rawah and Lower Supply Ditch;
The McIntyre Ditch;
The Deadman and Nunn Creek Ditch;
[fol. 2795] The Laramie River Tunnel;
The Link Lake Reservoirs, Nos. 1 to 14 inclusive; and
The Tunnel Reservoir.

The system consists throughout of works requiring great financial outlay. It is located at elevations of from 8,500 feet to 11,500 feet above sea level, a portion thereof being at timber line and in the region or perpetual snows. All of the construction involves tunneling and excavation through mountains and along the steep mountain sides on either side of the Laramie Valley, requiring a greater period of time in the completion thereof than would be required to complete an enterprise of like proportions situate under and surrounded by ordinary conditions. All sup-

plies, machinery and labor must be transported by teams for a distance of from seventy to one hundred miles, in large part over mountain roads, from either Laramie, Wyoming, or Fort Collins, Colorado, under conditions least favorable to economical transportation.

Owing to the altitude, climatic conditions and geographical location of the system, the working season, during which men may be engaged in other than tunnel construction, and the season of transportions of freight, are limited to a short period of from three to four months out of each year. The remoteness of the works from railroads, towns, cities, and labor centers, makes the obtaining of laborers difficult, and requires payment of high wages and maintenance of expensive accommodations. The construction throughout is of hazardous character, requiring the use of dynamite, powder and other explosives and the services of a class of laborers hard to obtain and easily dissatisfied. The shortness of the working season requires a total disorganization of the entire laboring force at the close of each year's work and complete reorganization the next succeeding year. The foregoing and many other obstacles un- [fol. 2796] known to construction of irrigation works in plains or prairie regions or in regions of better climatic conditions and geographical location, require longer periods of time than would otherwise be necessary, reasonable diligence being a question of years as compared with months under ordinary conditions.

The construction of the system of works of the claimant upon the Laramie River were commenced by the initiation of surveys on August 25th, 1902, and since said date the work of engineering and construction has continued with diligence, notwithstanding financial and other obstacles although since 1911 active work upon said system has been in large measure suspended owing to the effect of litigation pending in the United States Supreme Court between Wyoming and Colorado, and involving the right of claimant to divert the waters of the Laramie River by means of this system of works.

The tunnel and other portions of said system are substantially complete and ready for diversion of water, while other portions are only in part constructed, all as will appear from the specific findings herein relative to each of the units of the system.

Owing to the conditions under which the work upon said system was commenced and since prosecuted and the many obstacles to be overcome, as well as those unmentioned as those hereinbefore specified, it is found that more than ordinary diligence has been exercised by the claimant, and its several predecessors, in the prosecution of said system of works from August 25th, 1902, to the present time.

This general finding shall apply to the whole system and each unit thereof and is made to avoid repetition insofar as possible. It shall apply to the several units of the system hereinafter enumerated, without special findings or [fol. 2797] reference hereto in the findings for each unit, and shall be taken as incorporated in and as a part of the findings for each unit.

Each of the several units, while interdependent in large measure upon the other units of the system, nevertheless involves diversions from different tributaries of the Laramie River and is segregated into specific names and findings for the purpose of this decree. Each unit is given the same date of priority, and although different priority numbers are given, nevertheless each unit of said system shall have equal priority with each of the other units thereof.

No. 55—The Brinker Creek Ditch

This ditch is owned and claimed by Watson Ziegler, George A. Webb, and S. E. Eddy. The headgate is located at a point in the southwest quarter (SW¼) of the southeast quarter (SE¼) of section twenty-four (24), township nine (9), north range 76, whence the southeast corner of section 24 bears east 68 degrees and 10 minutes 1374 feet.

The Brinker Creek Ditch derives its supply of water from Brinker Creek, a tributary of the Big Laramie River. The ditch is one foot deep, three feet wide on the bottom, four feet wide on top, with a grade of 75 feet for the first 1300 feet, and a grade of ten feet per thousand from thence into Porter Creek. The ditch has a present carrying capacity of eight cubic feet per second of time, and is used to irrigate approximately forty acres of land. The ditch is entitled to priority by construction for eight cubic feet per second of time of date July 10, 1901, but owing to the fact that the then owner of the ditch and appropriations of water therethrough failed to make claim and have his

rights adjudicated at the time of the adjudication of priorities of right to the use of water in this water district, which said adjudication proceeding was had in this court and de-[fol. 2798] cree therein entered on the 11th day of October, 1906, claimant will be awarded Priority No. 67 and the date of the appropriation of water is fixed at July 10, 1901, but the claimant will not be permitted to take water from said stream for irrigation when the same will be required for use by the lowest appropriator in point of time as found and adjudged in said decree of October 11, 1906.

No. 56—The Pine Creek Ditch

This ditch is owned by Samuel O. Shipp. The headgate is located at a point which bears south 49 degrees, 22 minutes west 2562 feet from the quarter corner on the east side of Section 20, Township 10, N. Range 76 W.

The source of supply of water for this ditch is Pine Creek, a tributary of McIntyre Creek, which is a tributary of the Big Laramie River. The ditch is about one mile in length, with a top width of 4.5 feet and a bottom of 3.4 feet, a water depth of 1.2 feet, and a grade of 2.3 feet per thousand feet, and carrying capacity of 7.5 cubic feet of water per second of time. The ditch is used to irrigate approximately 75 acres of land. This ditch is entitled to priority No. 70, by construction of 4 cubic feet per second of time, bearing date the 20th day of August, 1902.

No. 57—The Pine Creek Ditch Extension.

This ditch is owned by Samuel O. Shipp, R. E. Moan and J. F. Moan. The headgate of this ditch is identical with the headgate of the Pine Creek Ditch, to-wit, at a point which bears south 49 degrees, 22 minutes west 2562 feet from the quarter corner on the east side of Section 20, Township 10, N. Range 76 West, and is an extension of the said, The Pine Creek Ditch. This extension ditch is about one half mile long, a top width of two feet, a bottom width of 1½ feet and [fol. 2799] a water depth of 1 foot, and a carrying capacity of 1.75 cubic feet per second of time. It is used to irrigate about 60 acres of land. It is entitled to Priority No. 87, by construction for 1.75 cubic feet of water per second of time, bearing date the 8th day of July 1911.

No. 58—The McIntyre Ditch

The owners of this ditch are R. E. Moan, J. F. Moan and Samuel O. Shipp. The headgate of this ditch is located at a point which bears south 28 degrees, 20 west 635 feet from the quarter corner on the east side of Section 20, Township 10, N. Range 76 West.

The source of supply of water for this ditch is McIntyre Creek, a tributary of the Big Laramie River. This ditch is 8 feet wide on top, 6 feet wide on the bottom, a water depth of 2.5 feet, a grade of 9 feet per thousand feet, and a carrying capacity of 19 cubic feet per second. This water is used to irrigate about 140 acres of land. This ditch is entitled to Priority No. 81 by construction for 7 cubic feet of water per second of time, bearing date the 25th day of July, 1908.

No. 59—The Nellie Ditch

The owner of this ditch is Mrs. Nellie Thompson. The headgate of the ditch is located at a point which bears south 31 degrees, 27 minutes west 1228 feet from the Northwest corner of Section 1, Township 10 N. Range 77 West of the 6th P. M. The source of supply of water for this ditch is McQuire Creek, a tributary of La Garde Creek, which is a tributary of the Big Laramie River. The ditch is five feet wide on the bottom, 8 feet wide on top, and a water depth of two feet, with a grade of 10 feet per mile, and a carrying capacity of 15.3 per second. This water is used to irrigate about 200 acres in conjunction with the Thompson ditch. This ditch is entitled to priority No. 76, by construction [fol. 2800] for 15.3 cubic feet of water per second of time, bearing date the 10th day of September, 1903.

No. 60—The Timothy Ditch

The owners of this ditch are Hannah Mansfield and Elton Mansfield and John Mansfield. The headgate of the ditch is located at a point south 21 degrees west 39 chains and 68 links from the north quarter corner of Section 23, Township 10 North, Range 76 West of the 6th P. M. The source of supply of water for this ditch is the Big Laramie River. Construction of this ditch was commenced on the 5th day of July, 1904. The ditch is about 6 miles in length, with a width of 7 feet on the bottom, 10 feet on top, and a

water depth of about 2 feet, and a grade of 5.5 feet per mile. The capacity of the ditch is 34.36 cubic feet per second. This witch is used to irrigate about 200 acres of land, and is capable of irrigating about 1500 acres as the same can be brought under cultivation. The ditch is entitled to Priority No. 77 by construction, for 34.36 cubic feet of water per second of time, bearing date the 5th day of July, 1904.

No. 61—Grace Creek Ditch, Second Enlargement

This ditch is owned by Everett D. Bullard. The headgate of the ditch is located on the left bank of the Grace Creek a tributary of the Laramie River on the Northwest quarter of the Northwest Quarter of Section 14, Township 11, N. Range 77 West of the 6th P. M., at a point south 37 degrees 45 minutes east 574 feet from the Northwest corner of said section 14. The capacity of this ditch, by original construction, was 3.07 feet of date April 1st, 1888, and by first enlargement of 6.3 cubic feet per second of April 28th, 1900. The source of supply of the ditch is the water of Grace Creek and the Big Laramie River, Grace Creek being a tributary of the Big Laramie River. The ditch as en- [fol. 2801] larged is 7 feet wide on top, 6 feet wide on the bottom, with a water depth of 2½ feet and a grade of 9 feet per mile, and a total carrying capacity of 20 cubic feet of water per second of time. The water of this second enlargement is used in conjunction with the priorities for this ditch by original construction, and by first enlargement, for the irrigation of about 480 acres. This second enlargement is entitled to Priority No. 80 for 10 cubic feet of water per second of time, of date the 1st day of April, 1907.

No. 62—The Ollie Ditch

The owner of this ditch is Elton Mansfield. The headgate of the ditch is located at a point on the west bank of Jimmy Creek, a tributary of the Big Laramie River, south 13 degrees 33 minutes east 1730 feet from the west quarter corner of Section 27, Township 11, North Range 76 West of the 6th P. M. The length of the ditch is about 3,000 feet. The ditch has a bottom width of 3.5 feet, a water depth of 10 inches, and a grade of 1.5 feet per thousand feet and a carrying capacity of 3.45 cubic feet of water per second of

time. The water of this ditch is used to irrigate about 60 acres of land.

This ditch was originally constructed in the spring of 1886, and water was applied for beneficial purposes in the irrigation of lands in that same year. The ditch is entitled to priority for the use of water for irrigation purposes to the amount of its Appropriation to-wit, 3.45 cubic feet per second of time, as of date June 1st, 1886, but owing to the fact that the then owner of the ditch and appropriations of water there through failed to make claim and have his rights adjudicated at the time of the adjudication of priorities of the right to the use of water in this water district, which said adjudication proceeding was had in this [fol. 2802] Court and decree therein entered on the 11th day of October, 1906, claimant will be awarded Priority No. 61, and the date of the appropriation of water is fixed at June 1st, 1886, but the claimant will not be permitted to take water from said stream for irrigation when the same shall be required for use by the lowest appropriator in point of time as found and adjudicated in said decree of October 11th, 1906.

No. 63—The La Garde Ditch Enlargement

The owners of this ditch are J. H. Detro, T. Forrester and Thomas Tatham. The headgate of the enlargement is located at the same point as the headgate of the La Garde Ditch, having Priority No. 11, of date June 10th, 1883. The source of supply of water for this enlargement is La Garde Creek, a tributary of the Big Laramie River. The ditch as enlarged is * * * feet wide on top * * * feet wide on the bottom, with a water depth of * * * feet, and a grade of * * * feet per mile, and a total carrying capacity of 15.2 cubic feet of water per second of time. Construction of this enlargement was commenced prior to the 1st day of June, 1896, and the water of the ditch as enlarged is used to irrigate 215 acres of land.

This ditch was originally enlarged prior to June 1st, 1896, and water was applied for beneficial purposes in the irrigation of lands prior to said date, but claim is made for Priority as of date June 1st, 1896. The ditch is entitled to priority for the use of water for irrigation purposes to the amount of its appropriation to-wit, 4.87 cubic feet of water per second of time by enlargement, as of date June 1st,

1896, but owing to the fact that the then owner of the ditch and appropriations of water therethrough failed to make claim and have his rights adjudicated at the time of the adjudication of priorities of the right to the use of water in this water district, which said adjudication proceeding [fol. 2803] was had in this Court and decree therein entered on the 11th day of October, 1906, claimant will be awarded Priority No. 64, and the date of the appropriation of water is fixed at June 1st, 1896, but the claimant will not be permitted to take water from said stream for irrigation when the same shall be required for use by the lowest appropriator in point of time as found and adjudicated in said decree of October 11th, 1906.

No. 64—Jimmy Creek Ditch Enlargement

The owner of this ditch is Thomas Tatham. The headgate of this ditch, as enlarged, are identical with the headgates of the Jimmy Creek Ditch, having Priority No. 14, of date June 1st, 1884, said ditch having two headgates and two sources of supply of water, namely, from the East bank of Jimmy Creek, and from the east bank of the Big Laramie River. The source of supply of water for this ditch is Jimmy Creek and the Big Laramie River, water being used from the Big Laramie River after the supply in Jimmy Creek has been exhausted. The ditch as enlarged is 4 feet wide on top, 4 feet wide on the bottom, with a water depth of 1.5 feet, and a carrying capacity of 15 cubic feet of water per second of time. The ditch is used for the irrigation of 200 acres of land.

This ditch was originally enlarged prior to June 2d, 1896, and water was applied for beneficial purposes in the irrigation of lands prior to said date, but claim is made for Priority as of June 2, 1896. The ditch is entitled to Priority for the use of water for irrigation purposes to the amount of its appropriation, to-wit, 15 cubic feet of water per second of time, as of date June 2d, 1896, but owing to the fact that the then owner of the ditch and appropriations of water therethrough failed to make claim and have his rights adjudicated at the time of the adjudication of priorities of the right to the use of water in this water district, [fol. 2804] which said adjudication proceeding was had in this Court and decree therein entered on the 11th day of October, 1906, claimant will be awarded Priority No. 65 by

enlargement and the date of the appropriation of water is fixed at June 2d, 1896, but the claimant will not be permitted to take water from said stream for irrigation when the same shall be required for use by the lowest appropriator in point of time as found and adjudicated in said decree of October 11th, 1906.

No. 65—The John Goetz Ditch No. 1

The owner of this ditch is E. M. Hohnholz. The headgate of the ditch is located on the right bank of Shell Creek, a tributary of Sand Creek, at a point whence the Southwest corner of Section 24, Township 12, North Range 76 west of the 6th P. M. bears south 52 degrees 5 minutes west 1,745 feet. The source of supply of water for this ditch is Shell Creek. The ditch is about 6 feet wide on top, 5 feet wide on the bottom, with a water depth of one foot, and a grade of 5 feet per mile, and a carrying capacity of 7.8 cubic feet of water per second of time. The ditch is used for the irrigation of about 100 acres of land.

This ditch was originally constructed in the spring of 1879, and water was applied for beneficial purposes in the irrigation of lands in June of that year. The ditch is entitled to priority for the use of water for irrigation purposes to the amount of its appropriation, to-wit, 7.8 cubic feet, per second of time, as of date June 1st, 1879, but owing to the fact that the then owner of the ditch and appropriation of water there through failed to make claim and have his rights adjudicated at the time of the adjudication of priorities of the right to the use of water in this water district, which said adjudication proceeding was had in this Court and decree entered on the 11th day of October, 1906, claimant will be awarded priority No. 60, and the date of [fol. 2805] appropriation of water is fixed at June 1st, 1879, but the claimant will not be permitted to take water from said stream for irrigation when the same shall be required for use by the lowest appropriator in point of time as found and adjudicated in said decree of October 11th, 1906.

No. 66—The John Goetz Ditch No. 2

This ditch is owned by E. M. Hohnholz. The headgate of the ditch is located on the left bank of Shell Creek, a tributary of Sand Creek, at a point when the west quarter

corner of Section 25, Township 12, North Range 76 West of the 6th P. M. bears south 75 degrees, fifteen minutes west 440 feet. The ditch is 6 feet wide on top, 5 feet wide on the bottom, a water depth of 1 foot, and a grade of 10 feet per mile, and a carrying capacity of 10 cubic feet per second, and is used to irrigate about 200 acres of land. This ditch is entitled to Priority No. 83 by construction for 10 cubic feet of water per second of time, of date the 9th day of June, 1909.

No. 67—The Shell Creek Ditch

The owner of this ditch is E. M. Hohnholz. The headgate of the ditch is located on the right bank of Shell Creek, a tributary of Sand Creek, at a point whence the west quarter corner of Section 25, Township 12, North Range 76 West of the 6th P. M., bears north 69 degrees, 52 minutes east 541 feet. The source of supply of water for this ditch is Shell Creek. The ditch is 5 feet wide on top, 3 feet wide on the bottom, a water depth of 1 foot, and a grade of 10 feet per mile, and a carrying capacity of 6.97 cubic feet of water per second. This ditch is used to irrigate about 80 acres of land. This ditch is entitled to Priority No. 84 by construction, for 6.97 cubic feet per second, bearing date the 10th day of June, 1909.

[fol. 2806] No. 68—The Dry Creek Ditch

The owner of this ditch is E. M. Hohnholz. The headgate of the ditch is located at a point on the left bank of Dry Creek, whence the east quarter corner of Section 25, Township 12, North Range 76, West of the 6th P. M., bears north 54 degrees east 970 feet. The source of supply of water for this ditch is Dry Creek. The ditch is 6 feet wide on top, 5 feet wide on the bottom, with a water depth of 1 foot, and a grade of 10 feet per mile, and a carrying capacity of 10 cubic feet per second of time. The waters of this ditch are used to irrigate about 125 acres. This ditch is entitled to Priority No. 85 by construction, for 10 cubic feet of water per second of time, bearing date the 11th day of June, 1909.

No. 69—The Thompson Ditch

The owner of this ditch is Mrs. Nellie Thompson. The headgate of the ditch is located at a point which bears

south 57 degrees, 50 minutes west 12,100 feet from the northeast corner of Section 1, Township 10 North, Range 77 West of the 6th P. M. The source of supply of this ditch is British Creek No. 2, a tributary of McIntyre Creek. The width of the ditch is 3 feet 3 inches on the bottom, with a slope of bank 1 to 1, and a water depth of 1.5 feet, and a grade of 10 feet per mile, and a carrying capacity of 5 cubic feet of water per second. This water is used to irrigate about 80 acres of land. This ditch is entitled to Priority No. 82 by construction, for 5 cubic feet of water per second of time, bearing date the 26th day of May, 1909.

No. 70—The Detro Ditch No. 2

The owner of this ditch is J. H. Detro. The headgate of the ditch is located at a point on the east bank of the Laramie River, south 77 degrees, 3 minutes east 1500 feet from the west quarter corner of Section 7, Township 11, North [fol. 2807] Range 76 West of the 6th P. M. The source of supply of this ditch is the Big Laramie River. The ditch is 3 feet wide on the bottom, a slope of banks 1 to 1, a water depth of 1.5 feet, and a grade of 1 foot to 1200 feet, and a carrying capacity of 8 cubic feet of water per second. This ditch is used to irrigate about 45 acres of land. The ditch is entitled to Priority No. 79, by construction, for 8 cubic feet of water per second of time, bearing date the 16th day of January, 1906.

No. 71—Stubb Creek Ditch

The owner of this ditch is Thomas H. Davy. The headgate of the ditch is on the west bank of Stubb Creek, at a point whence the northeast corner of Section 35, Township 10, North Range 76 West of the 6th P. M., bears north 80 degrees, 20 minutes east 1586 feet. The source of supply of water for this ditch is Stubb Creek, a tributary of the Big Laramie River. The ditch is 4 feet wide on top, 2 feet wide on the bottom, with a water depth of 1 foot, and a grade of 2 feet per thousand feet, and a carrying capacity of 5 cubic feet of water per second. The water is used to irrigate about 150 acres of land. This ditch is entitled to Priority No. 88, by construction, for 5 cubic feet of water per second of time, bearing date the 28th day of July, 1911.

No. 72—The Rawah Ditch of the Laramie River System

The claimant of this ditch is The Greeley-Poudre Irrigation District, a quasi-public or municipal corporation, organized and doing business under the laws of the State of Colorado, whose postoffice address is Greeley, Weld County, Colorado.

Said ditch derives its supply of water from Rawah, West Springer, Rapid, Fall, Winifred and Mill Creeks and divers other creeks, situate between Rawah Creek and the West [fol. 2808] Fork of the Laramie River, and the several tributaries of said several creeks. Each of the aforesaid streams are tributary to the Laramie River, entering said stream on the west side thereof, and each thereof is intersected by the said canal and the waters thereof diverted and conveyed by means of said ditch to the West Fork of the Laramie River, through and by means of said West Fork to the Tunnel Reservoir and thence through the Laramie River Tunnel to the Cache la Poudre River.

This ditch is sometimes known as "The Link Lake Ditch," "The Upper Collection Ditch," "The Upper West Side Ditch," "The Timber Line Collection Ditch," or "The Upper Ditch," of the Laramie River system of claimant. The said ditch not only diverts and carries water from the several streams and tributaries of the Laramie River aforesaid, but, also, in conjunction with The Link Lakes Reservoirs, The McIntyre Ditch, and the Lower Rawah & Supply Ditch and the Tunnel Reservoir, will be used for the carriage of waters stored in said The Link Lakes Reservoirs, or diverted from McIntyre Creek by means of the McIntyre Ditch, in manner more particularly set forth in the findings and decree pertinent to said reservoirs and said McIntyre Ditch. The McIntyre Ditch is in fact but a continuation or extension of the line of the Rawah Ditch, from Rawah Creek to McIntyre Creek, and is so constructed that the water thereby diverted and carried may be conveyed to the Laramie River Tunnel through either the Rawah Ditch or The Rawah & Lower Supply Ditch, and the flow thereof conserved, controlled and regulated by those of The Link Lakes Reservoirs situate below the line of The Rawah Ditch, as well as those of said reservoirs situate on McIntyre Creek.

The headgate or place of beginning of said ditch is in the east bank of Rawah Creek, in Larimer County, Colorado, near a point in the NE¼, SW¼ of Section 32, Town- [fol. 2809] ship 9 North, Range 76 West of the 6th P. M., whence the southwest corner of said section 32 bears South 50°50′ West 2950 feet. Said ditch extends thence in a general easterly and southerly direction through all, or portions, of Sections 32 and 33, Township 9 North, Range 76 West; Sections 4 and 5, Township 8 North, Range 76 West; Sections 33, 34 and 35, Township 9 North, Range 76 West, and Sections 2, 3 and 11, Township 8 North, Range 76 West of the 6th P. M., a total distance of about 6.4 miles to the point where said ditch discharges the waters thereby diverted and carried, into the West Fork of the Laramie River at a point not far distant from the headgate of the "Skyline Ditch" of The Water Supply & Storage Company and above the Tunnel Reservoir and Laramie River Tunnel. The said ditch is practically at timber line and situate 1500 to 2000 ft. higher in elevation than The Rawah & Lower Supply Ditch or the "Skyline Ditch" of The Water Supply & Storage Company.

The dimensions, size, grade and carrying capacity of said ditch are as follows: Width on bottom 6 feet, depth below high water line 4 feet, slopes of banks 1 to 1, grade 3 feet per thousand feet, or 15.84 feet per mile, save at various places along said ditch, where, by virtue of greatly increased grade, the same carrying capacity of said ditch is maintained, although the ditch is of reduced dimensions varying with the conditions under which said increased fall occurs. Said ditch has and will have a carrying capacity of 225 cubic feet of water per second of time. It is completed to a point within about one mile from its headgate on Rawah Creek, and is now in use for the diversion of waters from the several creeks by it intersected along the line of its present construction. The waters so diverted have been carried and discharged into the West Fork of the Laramie River and have been permitted to flow down [fol. 2810] the Laramie River during the construction and completion of the Laramie River Tunnel and the Tunnel Reservoir. Said ditch has, at the several points of intersection with the several streams aforesaid, appliances for the control of water flowing in said creeks, thereby giving said ditch several points of diversion.

It is also used for the carriage of water delivered to it at its headgate on Rawah Creek, by the McIntyre Ditch, in manner aforesaid, and waters stored in Link Lakes Reservoirs Nos. 1 to 11 inclusive, all for the better diversion, flow and equalization of the flow of waters into and through said ditch, said reservoirs or The Lower Rawah Supply Ditch. It will be used as a part, parcel or unit of the entire collection, regulation, diversion and carriage system of works of the claimant on the Laramie River, and, particularly, on the west side thereof, to the end that water may be maintained in said canal to the full carrying capacity thereof.

Work was commenced on this ditch, along with the several other ditches, reservoirs and the tunnel, constituting the Laramie River System of the claimant, on or about August 25, 1902, and has since hitherto been prosecuted with due diligence by the claimant and its predecessors in title and interest, but owing to the fact that said ditch is not completed, and no beneficial use has been made of the waters diverted by means of the constructed portion thereof, no findings in behalf of said ditch can be made, save as to the date and number of its priority, which is hereby fixed as August 25, 1902, and its priority is numbered No. 71. The amount of its appropriation when finally fixed and determined, insofar as its diversion of water from the several creeks aforesaid is concerned, shall be limited [fol. 2811] to 225 cubic feet of water per second of time from any and all of said streams, with the right to maintain the flow in said ditch constant at said capacity by the use of the Link Lakes Reservoirs 1 to 11 inclusive, the McIntyre Ditch and the other works of the district as interdependent and co-ordinate works, and sufficient by diversion of this and all other units of said system for the irrigation of not to exceed 125,000 acres of land.

No. 73—The Rawah & Lower Supply Ditch of the Laramie River System

The claimant of this ditch is The Greeley-Poudre Irrigation District, a quasi-public or municipal corporation, organized and doing business under the laws of the State of Colorado, whose postoffice address is Greeley, Weld County, Colorado.

Said ditch takes its supply of water from Rawah, West Springer, Rapid, Fall, Winfred, Mill and divers other creeks situate between the Rawah Creek and the Laramie River Tunnel, each of which said creeks is a tributary of the Laramie River, entering said stream on the west side thereof and is intersected by the said canal and the waters of each thereof are diverted and conveyed by means of said ditch to the Tunnel Reservoir of the claimant, and thence through the Laramie River Tunnel to the Cache la Poudre River.

This ditch is sometimes known as "The Lower Supply Ditch," "The Lower Rawah Ditch," "The West Side Collection Ditch," "The West Side Ditch" or "The West Feeder Ditch," and includes under one name separate units of said ditch line heretofore known as "The Rawah Pipe Ditch," "The Rawah Pipe Line," "The Fall Creek Ditch," [fol. 2812] and "The Fall Creek Pipe Line," (said pipe lines being now substituted by tunnels along the line of this ditch) of the Laramie River System of claimant. The said ditch not only diverts and carries water from the several streams and tributaries of the Laramie River aforesaid, but also, and in conjunction with the Rawah Ditch, McIntyre Ditch, Link Lakes Reservoirs and Tunnel Reservoir, will be used for the carriage of waters stored in Link Lakes Reservoirs or diverted from McIntyre Creek by means of the McIntyre Ditch, in manner more specifically set forth in the findings and decree pertinent to said reservoir and McIntyre Ditch.

The headgate or place of beginning of said ditch is in the east or south bank of Rawah Creek in Larimer County, Colorado, near a point in the Southwest Quarter (SW¼) Southeast Quarter (SE¼) of Section Fourteen (14), Township Nine (9) North, Range Seventy-six (76) West of the 6th P. M., whence the southeast corner of said section bears South 71°/0′ West about 2540 feet distant. Said ditch extends thence in a general southeasterly direction a distance of about 4.7 miles and traverses portions of Sections 14, 23, 25, 26 and 36 in Township Nine (9) North, Range 76 West; Sections 1 and 12, Township Eight (8) North, Range 76 West, and Section 7, Township Eight (8) North, Range 75 West of the 6th P. M., to the east terminus thereof, being the point where the said ditch discharges its waters into the bed and channel of the Laramie River,

at or near the west portal of the Laramie River Tunnel and into the accumulation basin of the Tunnel Reservoir. The said ditch intersects the several streams aforesaid along its course, and has at each of said points of intersection appliances for diversion, thereby constituting, as to each of such, a point of diversion at the said point of intersection of the line of said ditch with the thread of each of [fol. 2813] such streams.

The said ditch is divided into four divisions, for purpose of description, each of which are, or will be when complete, of the following dimensions, length and capacities:

Division	Material	Bottom width	side slopes of banks	Depth water	Grade per 1000 ft.	Length feet	Cap. cu. ft.
Rawah Creek	Loose	9 ft.	1 to 1	4 ft.	2 ft.	16000	200
	Solid	8 ft.	1–2 to 1	4 ft.	3 ft.		
Rapid Creek	Loose	10 ft.	1 to 1	4.5 ft.	1.5 ft.	2400	250
	Solid	9 ft.	1–2 to 1	4.5 ft.	3 ft.		
Fall Creek	Loose	11 ft.	1 to 1	4.5 ft.	1.5 ft.	3300	270
	Solid	10 ft.	1–2 to 1	4.5 ft.	2.7 ft.		
Mill Creek	Loose	11 ft.	1 to 1	4.6 ft.	1.5 ft.	3100	275
	Solid	10 ft.	1–2 to 1	4.6 ft.	2.7 ft.		

The Link Lakes Reservoirs Nos. 1 to 14 inclusive, as well as the Tunnel Reservoir, are claimed as regulating or expansion basins and works for this ditch, and the Rawah Ditch, hereinafter mentioned, as will appear in the specific findings and decree for each of said reservoirs, and the waters diverted and carried by this ditch are for final discharge into the Cache la Poudre River through the Laramie River Tunnel of claimant.

The said ditch constitutes an essential unit or portion of the diversion and storage system of the claimant in Water District 48, and is to be so used in conjunction with the remaining units of said system as to give to the claimant the maximum diversion, storage and carrying capacity of said system and its several units, including this unit, when [fol. 2814] used singly or in conjunction with one another for the irrigation of not to exceed 125,000 acres of land.

Work was commenced upon this ditch, along with the several other ditches and reservoirs and the tunnel going to make up the several units of the Laramie River diversion and storage system of claimant, on or about August 25, 1902, and has since hitherto been prosecuted with due diligence by the claimant and its predecessors in title and interest, but owing to the fact that said ditch is not wholly completed and no diversion of water has been made thereby no findings in behalf of said ditch can be made, save as to the date and number of its priority, which are hereby fixed as August 25, 1902, and its priority, is numbered Ditch Priority No. 72. The amount of its appropriation, when finally fixed and determined, insofar as its diversion along its line from aforesaid creeks is concerned, shall be limited to 275 cubic feet of water per second of time from all of said streams, with privilege of maintaining the flow in said ditch constant at said capacity by use of the Link Lakes Reservoirs and the Rawah and McIntyre Ditches and other works of the district as expansion, regulating and co-ordinate works, and sufficient by diversions of this and all the other units of said system for the irrigation of not to exceed 125,000 acres of land.

[fol. 2815] No. 74—The McIntyre Ditch

The claimant of this ditch is The Greeley-Poudre Irrigation District, a quasi-public or municipal corporation,

organized and doing business under the laws of the State of Colorado, whose postoffice address is Greeley, Weld County, Colorado.

Said ditch derives its supply of water from McIntyre Creek, a tributary of the Laramie River, at a point near the source of said creek, and is used in conjunction with the Link Lakes Reservoirs, The Rawah Ditch, The Rawah & Lower Supply Ditch, The Tunnel Reservoir, and the Laramie River Tunnel, for the diversion, control and carriage to the Cache la Poudre River of waters of that portion of McIntyre Creek above its point of diversion.

This ditch is sometimes known as the "Westerly Extension of The Rawah Ditch," or the "Upper End of the Rawah Ditch," of The Greeley-Poudre Irrigation District, in Water District No. 48. It not only diverts and carries water from that portion of McIntyre Creek situate above its point of diversion, but will, in conjunction with the other units of the Laramie River System of claimant, be used for carriage of waters stored and regulated by The Link Lakes Reservoirs, in manner as more particularly set forth in the findings and decree pertinent to said reservoirs. The said ditch will constitute a westerly extension of the line of the Rawah Ditch, from Rawah Creek to McIntyre Creek, and will be so constructed that the waters thereby diverted and carried may be conveyed from its point of discharge on Rawah Creek to the Tunnel Reservoir, by means of either The Rawah Ditch or by using Rawah Creek as a carrier down to the point of diversion of The Rawah & Lower Supply Ditch, and thence through said ditch, the Tunnel Reservoir and the Laramie River Tunnel, to the [fol. 2816] Cache la Poudre River. The McIntyre Ditch is about 2,000 feet higher in elevation than the Tunnel Reservoir and Rawah & Lower Supply Ditch. It is situate at timber line and draws its supply of water from the upper extremity of McIntyre Creek and quite near to one of the sources of that stream. The said ditch will, also, in a small measure, intersect certain small tributaries of Rawah Creek, and as to such there is a diversion of the waters therein flowing at said points of intersection.

The headgate or place of beginning of said ditch is upon the east bank of McIntyre Creek, in Larimer County, Colorado, at or near a point in the Northeast Quarter (NE¼) Northeast Quarter (NE¼) of Section Thirty-one (31),

Township Nine (9) North, Range Seventy-six (76) West of the 6th P. M., whence the west corner of said Section Thirty-one (31) bears South 12° 41′ East 4257 feet distant. Said ditch will extend thence in a general southeasterly direction through Sections Thirty-one (31) and Thirty-two (52), Township Nine (9) North, Range Seventy-six (76) West of the 6th P. M., a distance of upwards of a mile, to a point where it will discharge water into Rawah Creek, at or near a point whence the southwest corner of said Section 32 bears South 50° 50′ West 2950 feet distant, which point is near the headgate or intake of The Rawah Ditch, and from which point the waters delivered from the McIntyre Creek may be diverted and carried either through said Rawah Ditch or down Rawah Creek for re-diversion as hereinbefore determined.

The dimensions, size, grade and carrying capacity of said ditch will be as follows:

[fol. 2817] Width on bottom 4 feet, depth below high water line 2.2 feet, slope of bank 1 to 1, grade 3 feet per thousand feet, or 15.84 feet per mile. Said ditch, when complete, of the dimensions aforesaid, will have a carrying capacity of 40 cubic feet of water per second of time.

Said ditch will be used as one of the units of the Laramie River System of the claimant, in conjunction with the various other units of the system, and, particularly, that portion of the works situate on the west side of the Laramie River, for the regulation, control, diversion and carriage of the waters from McIntyre Creek, acting in conjunction with Link Lakes Reservoirs 10 and 11, which said reservoirs act in part as equalization basins for the McIntyre Ditch above its point of diversion on McIntyre Creek.

Work was commenced on this ditch, along with the several other ditches, reservoirs and the tunnel constituting the Laramie River System of the claimant, on or about August 25, 1902, and has since hitherto been prosecuted with due diligence through the prosecution of work upon the balance of said system of which it constitutes a part, but, owing to the fact that said ditch is not completed, and no diversion or carriage of waters has been made thereby, no findings in behalf of said ditch can be made, save as to the date and number of its priority, which is hereby fixed as of August 25, 1902, and its priority is numbered Ditch Priority No. 73.

The amount of its appropriation when finally fixed and determined shall be limited to 40 cubic feet of water per second of time from McIntyre Creek and its tributaries, with the right to maintain the flow of said ditch constant at said capacity by use of Link Lakes Reservoirs Nos. 10 [fol. 2818] and 11, and sufficient by diversion of this and all other of said units for the irrigation of not to exceed 125,000 acres of land.

No. 75—The Deadman and Nunn Creek Ditch of the Laramie River System

The claimant of this ditch is The Greeley-Poudre Irrigation District, a quasi-public or municipal corporation, organized and doing business under the laws of the State of Colorado, whose postoffice address is Greeley, Weld County, Colorado.

Said ditch derives its supply of water from Deadman, Nunn, Porter, Brinker, East Springer, Half Mile Creeks and several other small streams of unknown names situate between Brinker Creek and the Laramie River Tunnel. Said streams are tributary to the Laramie River, entering said stream on the east side thereof, and each of said streams is intersected by said ditch and the waters thereof diverted by said canal and conveyed to the Tunnel Reservoir and the west portal of the Laramie River Tunnel and thence through said tunnel to the Cache la Poudre River.

This ditch is sometimes known as "The East Side Collection Ditch," "The Deadman Ditch," or "The East Side Ditch" of the Laramie River System of claimant, in Water District No. 48. Said ditch has several points of diversion, which are identical with the points of intersection of said ditch with the aforesaid streams. Its first headgate or place of beginning is located upon the south or west bank of Deadman Creek, in Larimer County, Colorado, in the Northeast Quarter (NE¼) Southwest Quarter (SW¼) of Section Thirty-one (31), Township Ten (10) North, Range Seventy-five (75) West of the 6th P. M., at or near a point whence the southwest corner of said section bears South 43° 40′ West 2015 feet distant. Said ditch extends thence [fol. 2819] in a general southerly direction across Section Thirty-one (31), Township Ten (10) North, Range Seventy-five (75) West, Section Thirty-six (36), Township Ten (10) North, Range Seventy-six (76) West, Section One (1),

Township Nine (9) North, Range Seventy-six (76) West, Section Six (6), Seven (7) and Eighteen (18), Township Nine (9) North, Range Seventy-five (75) West, Sections Thirteen (13), Twenty-four (24), Twenty-five (25) and Thirty-six (36), Township Nine (9) North, Range Seventy-six (76) West, Section Thirty-one (31), Township Nine (9) North, Range Seventy-five (75) West, and Sections Six (6) and Seven (7), Township Eight (8) North, Range Seventy-five (75) West, a distance of about 7.6 miles and to the point where said ditch discharges the waters, thereby intercepted, diverted and conveyed, into the Laramie River and thence by means of the Tunnel Reservoir and the Laramie River Tunnel to the Cache la Poudre River.

The dimensions, grade, size and carrying capacity of said ditch vary from the point of beginning to the point of discharge, and are divided into three divisions, as follows:

Division	Material	Bottom width	Side slopes of banks	Water depth	Grade per 1000 ft.	Length feet	Cap. cu. ft.
Deadman	Loose	7 ft.	1 to 1	3.3 ft.	2.5 ft.	15000	125
	Solid	6 ft.	1-2 to 1	3.3 ft.	4.5 ft.		
Nunn	Loose	10 ft.	1 to 1	4.5 ft.	1.5 ft.	1100	250
	Solid	9 ft.	1-2 to 1	4.5 ft.	3.0 ft.		
Porter	Loose	11 ft.	1 to 1	4.5 ft.	1.6 ft.	24000	275
	Solid	10 ft.	1-2 to 1	4.5 ft.	2.7 ft.		

The Tunnel Reservoir is used with this canal (as well all other units of the system) for the better regulation, con- [fol. 2820] trol, temporary accumulation and discharge of waters into the Laramie River Tunnel.

The work was commenced upon this ditch, along with the several other ditches, reservoirs and the tunnel constituting the Laramie River System of claimant, on or about August 25, 1902, and has since hitherto been prosecuted with diligence by the claimant and its predecessors in interest. Owing to the fact that said ditch is not complete and no diversion of water has been made thereby, no findings in behalf of said ditch can be made, save as to the date and number of its priority, which are fixed as of August 25, 1902, and its priority is numbered Ditch Priority No. 74, said number and priority applying to diversion on each and every of said creeks so constituting its source of supply. The amount of its appropriation when finally fixed and determined, insofar as its diversion from the several creeks aforesaid is concerned, shall be limited to 275 cubic feet of water per second of time from all of said streams, with the right to use the said ditch and all other units of said system of the said claimant for the irrigation of not to exceed 125,- 000 acres of land.

No. 76—The Laramie River Tunnel of the Laramie River System

The claimant of this tunnel is The Greeley-Poudre Irrigation District, a quasi-public or municipal corporation, organized and doing business under the laws of the State of Colorado, whose postoffice address is Greeley, Weld County, Colorado.

The Laramie River Tunnel, when used in its capacity as a single diversion unit of the Laramie River System of the claimant and without regard to the use thereof for the carriage of water delivered to it by other units of the system, derives its supply of water from the Laramie River [fol. 2821] and the West Fork of the Laramie River and all tributaries of each of said streams entering the same above the mouth of said West Fork. Said waters are diverted and conveyed, by said tunnel, through the Green Mountains to the Cache la Poudre River for use by the claimant, its water users and consumers, by rediversion and

carriage, storage and application through the remainder of its system of works in Larimer and Weld Counties.

This tunnel is sometimes known as "The Laramie-Poudre Tunnel," or "The Greeley-Poudre Tunnel," of the claimant. It not only diverts and carries waters from the aforesaid streams in the manner as above stated, but, in addition thereto, is used with each and every of the several other units of the Laramie River System of claimant for the carriage of waters diverted, stored, carried and discharged by each and all of said units into said tunnel or into its regulating basin, the Tunnel Reservoir, situate at the west portal of said tunnel.

The intake or point of beginning of the said tunnel is on the east bank of the Laramie River at the mouth of the West Fork and in the NE¼ SW¼ of Section Seven (7), Township Eight (8) North, Range 75 West of the 6th P. M., in Larimer County, Colorado, in Water District No. 48. From thence water is conveyed through an open cut for about 1100 feet to and into the west portal of said tunnel, from which point said tunnel extends in a general easterly-southeasterly direction under and through a range of mountains known as the Green Mountains and constituting the watershed between the Laramie and Cache la Poudre Rivers, a distance of about 12,400 feet (including the 1100 feet of open cut aforesaid) and through portions of Sec- [fol. 2822] tions 7, 8, 9 and 16, Township 8 North, Range 75 West of the 6th P. M. The waters conveyed through said tunnel are discharged near a point in the NW¼ NE¼ of Section Sixteen (16), Township 8 North, Range 75 West of the 6th P. M., whence the northwest corner of said Section 16 bears South 81° 35′ West about 3280 feet distant, and flow thence to the Cache la Poudre River.

Said tunnel is 9½ feet wide by 7½ feet high in the clear. It has a grade of 1.7 feet per one hundred feet and an estimated carrying capacity, without pressure of water in the Tunnel Reservoir, of about 1,000 cubic feet of water per second of time.

Said tunnel has a two-fold purpose, to-wit:

1st. For the diversion of waters from the Laramie River and the West Fork thereof at its point of intake and the conveyance of said waters to and into the Cache la Poudre River for purposes of irrigation as aforesaid.

2nd. As an integral part, unit or portion of the entire Laramie River System of ditches, reservoirs and tunnel of claimant, including the McIntyre, Rawah, Rawah & Lower Supply and Deadman and Nunn Creek Ditches, the Link Lakes Reservoirs and the Tunnel Reservoir, each in this proceeding by separate findings described, and to be used in conjunction with the said remaining units or portions of said system for the conveyance of the waters collected, regulated, carried and discharged at the west portal by said ditches and reservoirs, in such manner as to give the maximum diversion, collection, storage and carrying capacity to said system and its various units or parts for the irrigation of 125,000 acres of land.

The increased head or pressure at the west portal of said tunnel, occasioned by increased depth of water in the Tun-
[fol. 2823] nel Reservoir, will give said tunnel an additional estimated carrying capacity of about 235 cubic feet of water per second of time, when said reservoir is filled to its high water line, and a total estimated carrying capacity of 1235 cubic feet of water per second of time by the use of said reservoir as a regulating, accumulation or controlling basin.

Work was commenced on said tunnel, along with the several other units of said Laramie River System of claimant, on or about August 25, 1902, and has since hitherto been prosecuted with exceptional diligence by claimant and its predecessors in title and interest, having been constructed at a speed exceeding all records theretofore established in the history of tunnel construction in tunnels of like dimension. The rock work was completed July 25, 1911, since which date various improvements have been made upon the same by claimant. It has not been used for the diversion or carriage of water owing to conditions growing, in large measure, out of litigation between Wyoming and Colorado, pending in the United States Supreme Court and involving the right of claimant to use said tunnel for the diversion of waters of the Laramie River. Owing to the fact that no diversion or beneficial use of water has been made by means of said tunnel, no findings and decree in that behalf can be made, save as to the date and number of its priority, which is hereby fixed as of August 25, 1902, and its priority is numbered Ditch Priority No. 75. The

amount of its appropriation when finally fixed and determined, shall be limited to its present dimensions, grade and capacity from all sources of supply and diverted by said tunnel and each of its said co-ordinate units, for the irrigation of not to exceed 125,000 acres of land.

[fol. 2824] No. 77—The Upper Hills Ditch

This ditch is owned by the Greeley-Poudre Irrigation District. The headgate is located on the east bank of the Laramie River, at a point, whence the south quarter corner of Section 34, Township 11, North Range 76 West of the 6th P. M., bears south 73 degrees 18 minutes east 2345 feet. The source of supply of water for this ditch is the Big Laramie River. The ditch is 5 feet wide on top, 4 feet wide on the bottom with a water depth of 2 feet, a grade of 2 feet per thousand, and a carrying capacity of 10 cubic feet of water per second of time. This ditch is used for the irrigation of about 200 acres of land.

This ditch was originally constructed in the spring of 1887, and water was applied for beneficial purposes in the irrigation of lands of the same year. The ditch is entitled to priority for the use of water for irrigation purposes to the amount of its appropriation, to-wit, 10 cubic feet of water per second of time, as of date May 1, 1887, but owing to the fact that the then owner of the ditch and appropriations of water there through failed to make claim and have his rights adjudicated at the time of the adjudication of priorities of the right to the use of water in this water district, which said adjudication proceeding was had in this Court and decree therein entered on the 11th day of October, A. D. 1906, claimant will be awarded Priority No. 62, and the date of appropriation of water is fixed at May 1st, 1887, but the claimant will not be permitted to take water from said stream for irrigation when the same shall be required for use by the lowest appropriator in point of time as found and adjudicated in said decree of October 11th, 1906.

[fol. 2825] No. 78—Second Enlargement and Extension of Martin Ditch No. 2

The owner of the enlargement and extension is The Greeley-Poudre Irrigation District. The headgate of the

ditch is located on the west bank of the Laramie River, at a point whence the north quarter corner of Section 10, Township 10, North Range 76 West of the 6th P. M., bears north 4 degrees, 35 minutes west 1920 feet. The source of supply of water for this ditch is the Big Laramie River. The ditch as enlarged by the claimant is nine feet wide on top, 7 feet wide on the bottom, with a grade of 1 foot per thousand feet and a water depth of 2 feet, with a carrying capacity of 26 cubic feet of water per second, and the size of the extension of the Martin Ditch No. 2. is four feet wide on the top, 2 feet wide on the bottom, a water depth of 2 feet, and a grade of 2 feet per thousand feet, and a carrying capacity of 6 cubic feet of water per second of time. This ditch is used to irrigate about 80 acres of land. The ditch is entitled to Priority No. 86, by enlargement and extension, for 6 cubic feet of water per second of time, bearing date the 25th day of May, 1910.

No. 79—Enlargement of the Mansfield Ditch

The owner of this ditch and the enlargement thereof is The Greeley-Poudre Irrigation District. The headgate of the Enlargement is identical with the headgate of the Mansfield Ditch as shown in the former decree of this court, said ditch being Priority No. 8 of date April 20, 1882. The ditch as enlarged is 6 feet wide on the bottom, 8 feet wide on top, a water depth of 1.8 feet and a grade of 5.28 feet per mile, and a carrying capacity of 27.22 cubic feet of water per second. The source of supply of water for this ditch and its enlargement is the Big Laramie River. [fol. 2826] This ditch is used for the irrigation of 75 acres of land. The ditch is entitled to priority by enlargement for 4 feet additional, making a total of 15.61 cubic feet of water per second of time, bearing date the 1st day of April, 1902, but owing to the fact that the then owner of the ditch and appropriations of water therethrough failed to make claim and have his rights adjudicated at the time of the adjudication of priorities of right to the use of water in this water district, which said adjudication proceeding was had in this court and decree therein entered on the 11th day of October, 1906, claimant will be awarded Priority No. 68 and the date of the appropriation of water is fixed at April 1, 1902, but the claimant will not be permitted to take water from said stream for irrigation when the same

will be required for use by the lowest appropriator in point of time as found and adjudged in said decree of October 11, 1906.

No. 80—The Enlargement of Mansfield Ditch No. 2

The owner of the Enlargement of the Mansfield Ditch No. 2 is The Greeley-Poudre Irrigation District. The headgate of this ditch is located at the identical point of the location of the headgate of the Mansfield Ditch No. 2, as heretofore fixed by decree of this court wherein said ditch was given Priority No. 1, as of date June 1, 1880. The source of supply of this enlargement is the water of the Big Laramie River. The ditch as enlarged is 4 feet wide on the bottom, 6 feet wide on top, a water depth of 1.8 feet, and a grade of 5.28 feet per mile, and a carrying capacity of 21.74 cubic feet of water per second. The ditch [fol. 2827] as enlarged is used for the irrigation of about 150 acres of land. This ditch is entitled to priority by enlargement for 1.9 cubic feet of water per second of time, bearing date the 15th day of April, 1902, but owing to the fact that the then owner of the ditch and appropriations of water therethrough failed to make claim and have his rights adjudicated at the time of the adjudication of priorities of right to use of water in this water district, which said adjudication proceeding was had in this court and decree therein entered on the 11th day of October, 1906, claimant will be awarded Priority No. 69 and the date of the appropriation of water is fixed at April 15, 1902, but the claimant will not be permitted to take water from said stream for irrigation when the same will be required for use by the lowest appropriator in point of time as found and adjudged in said decree of October 11, 1906.

No. 81—Mansfield Ditch No. 3

The claimant of this ditch is The Greeley-Poudre Irrigation District, a corporation, whose post office address is Greeley, Weld County, Colorado.

It derives its supply of water from the Laramie River, the headgate thereof being on the west Bank of said stream, at a point bearing south 74 degrees, 45 minutes East 1365 feet from the east quarter corner of Section Two (2), Township Eleven (11) North, Range Seventy Seven (77)

West of the 6th P. M. From its headgate the ditch runs in a general northwesterly direction and when complete will be about one and one half miles in length. It is in a large measure constructed, and will be used for the irrigation of lands on what is known as the Mansfield or Upper Boswell Ranch, and lying and being above the line of the Mansfield Ditch No. 2.

[fol. 2828] It is being constructed of the following dimensions and capacity: Six feet wide on the bottom, eight feet wide on top, water depth two feet, a grade of 5.28 feet per mile, and has a carrying capacity of 29.4 cubic feet of water per second of time. Work was commenced on the construction of said ditch on September 1st, 1904, under the direction of the former owner of said ranch, and has since hitherto been prosecuted with diligence by claimant and its predecessors in interest, but owing to the fact that said ditch is not complete and no diversion of water has been made thereby, no findings on behalf of said ditch can be made, save as to the date and number of its priority which are hereby fixed as of September 1st, 1904, and its priority is numbered Ditch Priority No. 78. The amount of its appropriation when finally fixed and determined shall be limited to the capacity of said ditch, which shall be not to exceed 29.4 cubic feet of water, and the use of the water diverted thereby shall be limited to the irrigation of not to exceed 75 acres of land, in addition to those already irrigated under the Mansfield Ditch No. 2, across which latter lands the return water from this ditch must pass in returning to the river.

No. 82—The Stuart Ditch

This ditch is owned by The Greeley-Poudre Irrigation District. The headgate of the ditch is located on the north bank of Stuart Creek, at a point whence the southwest corner, of Section 5, Township 10, North Range 76 West of the 6th P. M., bears south 10 degrees, east 4045 feet. The source of supply of water for this ditch is Stuart Creek, [fol. 2829] a tributary of McIntyre Creek. The ditch is 3 feet wide on the bottom, 5 feet wide on top, a water depth of 1 foot, a grade of 5.28 feet per mile, and a carrying capacity of 7.2 cubic feet of water per second. The ditch is used for the irrigation of about 25 acres of land.

The ditch was originally constructed in the year 1896, and water was applied for beneficial purposes in the irrigation of lands in the same year. The ditch is entitled to priority for the use of water for irrigation purposes to the amount of its appropriation, to-wit, 7.2 cubic feet of water per second of time, as of date April 15, 1896, but owing to the fact that the then owner of the ditch and appropriations of water there through failed to make claim and have his rights adjudicated at the time of the adjudication of priorities of the right to the use of water in this water district, which said adjudication proceeding was had in this Court, and decree therein entered on the 11th day of October, 1906, claimant will be awarded Priority No. 63, and the date of appropriation of water is fixed at April 15th, 1896, but the claimant will not be permitted to take water from said stream for irrigation when the same shall be required for use by the lowest appropriator in point of time as found and adjudicated in said decree of 11th of October, 1906.

No. 83—The Stuart Ditch No. 2

Claimant of said ditch is The Greeley-Poudre Irrigation District, a corporation, whose post office address is Greeley, Weld County, Colorado. It derives its supply of water from McIntyre Creek, a tributary of the Laramie River, the headgate thereof being located on the east bank of said creek at a point whence the north quarter section cor- [fol. 2830] ner of Section Five (5), Township Ten (10) North Range Seventy-six (76) West, bears north 24 degrees fifty minutes west 7770 feet distant, from which point it runs in a northerly direction for about two miles. Said ditch is being constructed six feet wide on the bottom, eight feet wide on top, capable of carrying water two feet in depth, with a grade of 5.28 feet per mile and a carrying capacity of 29.4 cubic feet of water per second of time, for the irrigation of about 60 acres of land belonging to the claimant, and lying on the east side of McIntyre Creek, which said lands constitute a portion of the west slope of Middle Mountain, which owing to their nature, require a considerable amount of water for their proper irrigation.

Work was commenced on said ditch May 24th, 1913, and has since hitherto been prosecuted with diligence by the

claimant, but owing to the fact that said ditch is not complete and no diversion or application of water has been made thereby, no findings in behalf of said ditch can be made, save as to the date and number of its priority, which are hereby fixed as of May 24th, 1913, and its priority is numbered Ditch Priority No. 89. The amount of its appropriation when finally fixed and determined shall be limited not to exceed 29.4 cubic feet of water per second of time, for the irrigation of not to exceed 60 acres of land, situate as aforesaid.

No. 84—Enlargement of Link Ditch No. 2

The owner of this ditch is The Greeley-Poudre Irrigation District. The headgate of this ditch is identical with the headgate of the Link Ditch No. 2, as heretofore fixed by decree of this Court in Priority No. 32, of date the 15th day of June, 1896. The ditch as enlarged is 2 feet wide on the bottom, 4 feet wide on top, a water depth of 1 foot, [fol. 2831] and a grade of 5.28 feet per mile, and a carrying capacity of 5.4 feet of water per second of time. The ditch as enlarged is used for the irrigation of about 50 acres of land.

This ditch was originally constructed in the spring of 1896, and water was applied for beneficial purposes in the irrigation of lands the same year. The ditch is entitled to Priority for the use of water for irrigation purposes to the amount of its appropriation, to-wit, 5.4 cubic feet of water per second of time, as of date June 15th, 1896, but owing to the fact that the then owner of the ditch and appropriations of water there through failed to make claim and have his rights adjudicated at the time of the adjudication of priorities of the right to the use of water in this water district, which said adjudication proceeding was had in this Court and decree therein entered on the 11th day of October, A. D. 1906, claimant will be awarded Priority No. 66, for 3.4 cubic feet additional and the date of appropriation of water is fixed at June 15th, 1896, but the claimant will not be permitted to take said 3.4 cubic feet of water from said stream for irrigation when the same shall be required for use by the lowest appropriator in point of time as found and adjudicated in said decree of October 11th, 1906.

[fol. 2832] Reservoir Findings

[fol. 2833] No. 3—Wears Ditch & Reservoir

This reservoir is owned by James A. Wears, and is located on Sections 34 and 35, Township 11 North, Range 76 West of the 6th P. M. Water can be stored in this reservoir and drawn off to a depth of 7 feet 6 inhces above the bottom of the outlet tube, and the reservoir has a capacity as now constructed of 2,947,628 cubic feet. The reservoir derives its supply of water from Jim Creek, a tributary of the Big Laramie River in Water District No. 48. This reservoir is used to irrigate about 160 acres of land. The reservoir is entitled to Priority No. 19, by original construction of date October 15th, 1908.

No. 4—Johnson Reservoir

This reservoir is owned by Everett D. Bullard, and is located on parts of Sections 2, 3, 10 and 11, in Township 11 North, Range 77 West of the 6th P. M., and has an area at its upper contour of about 52 acres. Water can be stored and drawn off to a depth of 3 feet and the reservoir has a capacity as now constructed of 6,500,000 cubic feet. This reservoir derives its supply of water from Grace Creek, a tributary of the Big Laramie River, through the Grace Creek Ditch, which ditch has a carrying capacity of 20 cubic feet of water per second of time. This reservoir has been used to irrigate about 100 acres of land.

This reservoir is entitled by original construction to Priority No. 3, bearing date June 1st, 1897.

[fol. 2834] No. 5—The Link Lake Reservoir No. 1

The claimant of this reservoir is The Greeley-Poudre Irrigation District, a quasi-public or municipal corporation, organized and doing business under the laws of the State of Colorado, whose postoffice address is Greeley, Weld County, Colorado.

Said reservoir derives its supply of water, in Water District No. 48, from a branch of Rawah Creek and tributaries thereof entering said stream above the said reservoir. It will be constructed in, upon and across the channel of said branch of Rawah Creek, and has no inlet ditch. It is situate near timber line and at the foot of the snowy range.

Said reservoir is located in Larimer County, Colorado, in the SE¼ of Section 7, Township 8 North, Range 76 West of the 6th P. M. When complete it will have an area at high water line of 30 acres, will be capable of storing water and regulating the flow thereof to a depth of 35 feet and will have a storage and regulating capacity of 45,738,000 cubic feet.

The said reservoir, along with the remaining thirteen Link Lakes Reservoirs, has a two-fold purpose, to-wit:

1st. As an essential part of the Laramie River System of the claimant when used as an expansion or regulating basin for the collection, diversion, control and proper discharge of the waters of Rawah and McIntyre Creeks, into and through the said Rawah Creek as a carrier, and through the McIntyre, Rawah and Lower Supply Ditches into the Tunnel Reservoir, for conveyance, expansion, accumulation, control and final discharge through the Laramie River Tunnel and into the Cache la Poudre River for diversion from said stream to the lands of the claimant.

2nd. For use in the usual manner as a storage reservoir for the storage of waters for agricultural and other bene- [fol. 2835] ficial uses at times other than those when said reservoir shall be in use as a regulating or expansion basin, and when used for such purposes the said creeks, ditches, reservoir and tunnel shall be used as outlet, carriage and discharge works for said reservoir.

Said reservoir constitutes an essential part, unit or portion of the entire Laramie River System of the claimant, and, when completed, will be used in conjunction with the remaining units or portions of said system in such manner as to give the maximum diversion, collection, storage and carrying capacity to said system and its various units or parts for the irrigation of 125,000 acres of land.

Work was commenced upon this reservoir, along with the several other units or portions of the said Laramie River System of claimant, on or about August 25, 1902, and has since hitherto been prosecuted with diligence by the claimant and its predecessors in title and interest. Owing to the fact that such reservoir is not as yet completed, and no use thereof has been made for the collection, storage or diversion of waters, no findings in behalf of said reservoir

can be made, save as to the number and date of its priority, which is hereby fixed as August 25, 1902, and its priority is numbered Reservoir Priority No. 4. Its appropriation shall not exceed a storage depth of 35 feet above the bottom of the outlet tube and a capacity of 45,738,000 cubic feet, and in addition thereto the right to use said reservoir and any or all of its capacity, in conjunction with the other reservoirs and units of said system of irrigation works, and, particularly, the Rawah Ditch, The Rawah & Lower Supply Ditch, the Tunnel Reservoir and the Laramie River Tunnel, for the better regulation of the flow, delivery and [fol. 2836] discharge of waters through said units, to the several carrying and regulating capacities of each thereof, as more particularly specified in the findings and decree pertinent to each. Said appropriation shall also be limited in said decree to the irrigation of 125,000 acres of land by means of said reservoir and all the other units and portions of the said irrigation system of claimant.

No. 6—The Link Lake Reservoir No. 2

The claimant of this reservoir is The Greeley-Poudre Irrigation District, a quasi-public or municipal corporation, organized and doing business under the laws of the State of Colorado, whose postoffice address is Greeley, Weld County, Colorado.

Said reservoir derives its supply of water, in Water District No. 48, from a branch of Rawah Creek and tributaries thereof entering said stream above the said reservoir. It will be constructed in, upon and across the channel of said branch of Rawah Creek, and has no inlet ditch. It is situate near timber line and at the foot of the snowy range.

Said reservoir is located in Larimer County, Colorado, in the SW¼ of Section 5, Township 8 North, Range 76 West of the 6th P. M. When complete it will have an area at high water line of about 50 acres, will be capable of storing water 30 feet in depth and will have a storage and regulating capacity of 60,984,000 cubic feet.

The said reservoir, along with the remaining thirteen Link Lakes Reservoirs, has a two fold purpose, to-wit:

1st. As an essential part of the Laramie River System of the claimant when used as an expansion or regulating basin for the collection, diversion, control and proper dis-

charge of the waters of Rawah and McIntyre Creeks, into [fol. 2837] and through the said Rawah Creek as a carrier, and through the McIntyre, Rawah and Lower Supply Ditches into the Tunnel Reservoir, for conveyance, expansion, accumulation, control and final discharge through the Laramie River Tunnel and into the Cache la Poudre River for diversion from said stream to the lands of the claimant.

2nd. For use in the usual manner as a storage reservoir for the storage of waters for agricultural and other beneficial uses at times other than those when said reservoir shall be in use as a regulating or expansion basin, and when used for such purposes the said creeks, ditches, reservoir and tunnel shall be used as outlet, carriage and discharge works for said reservoir.

Said reservoir constitutes an essential part, unit or portion of the entire Laramie River System of the claimant, and, when completed, will be used in conjunction with the remaining units or portions of said system in such manner as to give the maximum diversion, collection, storage and carrying capacity to said system and its various units or parts for the irrigation of 125,000 acres of land.

Work was commenced upon this reservoir, along with the several other units or portions of the said Laramie River System of claimant, on or about August 25, 1902, and has since hitherto been prosecuted with diligence by the claimant and its predecessors in title and interest. Owing to the fact that such reservoir is not as yet completed, and no use thereof has been made for the collection, storage or diversion of waters, no findings in behalf of said reservoir can be made, save as to the number and date of its priority, which is hereby fixed as August 25, 1902, and its priority is numbered Reservoir Priority No. 5. Its appropriation shall not exceed a storage depth of 30 feet above the bottom of the outlet tube and a capacity of 60,984,000 cubic feet, [fol. 2838] and in addition thereto, the right to use said reservoir and any and all of its capacity, in conjunction with the other reservoirs and units of said system of irrigation works, and, particularly, the Rawah Ditch, The Rawah & Lower Supply Ditch, the Tunnel Reservoir and the Laramie River Tunnel, for the better regulation of the flow, delivery and discharge of waters through said units to the several carrying and regulating capacities of each thereof,

as more particularly specified in the findings and decree pertinent to each. Said appropriation shall also be limited in said decree to the irrigation of 125,000 acres of land by means of said reservoir and all the other units and portions of said irrigation system of the said claimant.

No. 7—The Link Lake Reservoir No. 3

The claimant of this reservoir is The Greeley-Poudre Irrigation District, a quasi-public or municipal corporation, organized and doing business under the laws of the State of Colorado, whose postoffice address is Greeley, Weld County, Colorado.

Said reservoir derives its supply of water, in Water District No. 48, from a branch of Rawah Creek and tributaries thereof entering said stream above said reservoir. It will be constructed in, upon and across the channel of said branch of Rawah Creek, and has no inlet ditch. It is situate near timber line and at the foot of the snowy range.

Said reservoir is located in Larimer County, Colorado, in the NW¼ of Section 5, Township 8 North, Range 76 West of the 6th P. M. When complete it will have an area at high water line of about 16 acres, will be capable of storing water and regulating the flow thereof to a depth of 30 feet, and will have a storage and regulating capacity of 22,869,000 cubic feet.

[fol. 2839] The said reservoir, along with the remaining thirteen Link Lakes Reservoirs, has a two fold purpose, to-wit:

1st. As an essential part of the Laramie River System of the claimant when used as an expansion or regulating basin for the collection, diversion, control and proper discharge of the waters of Rawah and McIntyre Creeks, into and through the said Rawah Creek as a carrier, and through the McIntyre, Rawah and Lower Supply Ditches into the Tunnel Reservoir, for conveyance, expansion, accumulation, control and final discharge through the Laramie River Tunnel and into the Cache La Poudre River for diversion from said stream to the lands of the claimant.

2nd. For use in the usual manner as a storage reservoir for the storage of waters for agricultural and other beneficial uses at times other than those when said reservoir shall be in use as a regulating or expansion basin, and when

used for such purposes the said creeks, ditches, reservoir and tunnel shall be used as outlet, carriage and discharge works for said reservoir.

Said reservoir constitutes an essential part, unit or portion of the entire Laramie River System of the claimant, and, when completed, will be used in conjunction with the remaining units or portions of said system in such manner as to give the maximum diversion, collection, storage and carrying capacity to said system and its various units or parts for the irrigation of 125,000 acres of land.

Work was commenced upon this reservoir, along with the several other units or portions of the said Laramie River System of claimant, on or about August 25, 1902, and has since hitherto been prosecuted with diligence by the claimant and its predecessors in title and interest. Owing to the [fol. 2840] fact that such reservoir is not as yet completed, and no use thereof has been made for the collection, storage or diversion of waters, no findings in behalf of said reservoir can be made, save as to the number and date of its priority, which is hereby fixed as August 25, 1902, and its priority is numbered Reservoir Priority No. 6. Its appropriation shall not exceed a storage depth of 30 feet above the bottom of the outlet tube and a capacity of 22,869,000 cubic feet, and, in addition thereto, the right to use said reservoir and any or all of its capacity in conjunction with the other reservoir and units of said system of irrigation works, and, particularly, the Rawah Ditch, The Rawah & Lower Supply Ditch, the Tunnel Reservoir and the Laramie River Tunnel, for the better regulation of the flow, delivery and discharge of waters through said units to the several regulating and carrying capacities of each thereof, as more particularly specified in the findings and decree pertinent to each. Said appropriation shall also be limited in said decree to the irrigation of 125,000 acres of land by means of said reservoir and the other units and portions of said irrigation system of the said claimant.

No. 8—The Link Lake Reservoir No. 4

The claimant of this reservoir is The Greeley-Poudre Irrigation District, a quasi-public or municipal corporation, organized and doing business under the laws of the State of Colorado, whose postoffice address is Greeley, Weld County, Colorado.

Said reservoir derives its supply of water, in Water District No. 48, from Rawah Creek and tributaries thereof entering said stream above said reservoir. It will be constructed in, upon and across the channel of said Rawah Creek, and has no inlet ditch. It is situate at the foot of the [fol. 2841] snowy range and near timber line.

Said reservoir is located in Larimer County, Colorado, in the NW¼ of Section 5, Township 8 North, Range 76 West and the SW¼ of Section 32, Township 9 North, Range 76 West of the 6th P. M. When complete it will have an area at high water line of about 20 acres and will be capable of storing and regulating the flow of water to a depth of 25 feet and will have a storage and regulating capacity of 21,780,000 cubic feet.

The said reservoir, along with the remaining thirteen Link Lakes Reservoirs, has a two fold purpose, to-wit:

1st. As an essential part of the Laramie River System of the claimant when used as an expansion or regulating basin for the collection, diversion, control and proper discharge of the waters of Rawah and McIntyre Creeks, into and through the said Rawah Creek as a carrier, and through the McIntyre, Rawah and Lower Supply Ditches into the Tunnel Reservoir, for conveyance, expansion, accumulation, control and final discharge through the Laramie River Tunnel and into the Cache la Poudre River for diversion from said stream to the lands of the claimant.

2nd. For use in the usual manner as a storage reservoir for the storage of waters for agricultural and other beneficial uses at times other than those when said reservoir shall be in use as a regulating or expansion basin, and when used for such purposes the said creeks, ditches, reservoir and tunnel shall be used as outlet, carriage and discharge works for said reservoir.

Said reservoir constitutes an essential part, unit or portion of the entire Laramie River System of the claimant, and, when completed, will be used in conjunction with the remaining units or portions of said system in such manner as to give the maximum diversion, collection, storage and carrying capacity to said system and its various units or parts for the irrigation of 125,000 acres of land.

[fol. 2842] Work was commenced upon this reservoir, along with the several other units or portions of the said

Laramie River System of claimant, on or about August 25, 1902, and has since hitherto been prosecuted with diligence by the claimant and its predecessors in title and interest. Owing to the fact that such reservoir is not as yet completed, and no use thereof has been made for the collection, storage or diversion of waters, no findings in behalf of said reservoir can be made, save as to the number and date of its priority, which is hereby fixed as August 25, 1902, and its priority is numbered Reservoir Priority No. 7. Its appropriation shall not exceed a storage depth of 25 feet above the bottom of the outlet tube and a capacity of 21,780,000 cubic feet, and in addition thereto, the right to use said reservoir and any or all of its capacity in conjunction with the other reservoirs and units of said system of irrigation works, and, particularly, the Rawah Ditch, The Rawah & Lower Supply Ditch, The Tunnel Reservoir and the Laramie River Tunnel, for the better regulation of the flow, delivery and discharge of waters through said units, to the several carrying and regulating capacities of each thereof, as more particularly specified in the findings and decree pertinent to each. Said appropriation shall also be limited in said decree to the irrigation of 125,000 acres of land by means of said reservoir and all the other units and portions of the said irrigation system of said claimant.

[fol. 2843] No. 9—The Link Lake Reservoir No. 5

The claimant of this reservoir is The Greeley-Poudre Irrigation District, a quasi-public or municipal corporation, organized and doing business under the laws of the State of Colorado, whose postoffice address is Greeley, Weld County, Colorado.

Said reservoir derives its supply of water, in Water District No. 48, from a branch of Rawah Creek, and tributaries thereof entering said stream above said reservoir. It will be constructed in, upon and across the channel of said branch of said Rawah Creek and has no inlet ditch. It is situate at the foot of the snowy range and near timber line.

Said reservoir is located in Larimer County, Colorado, in the N½ of Section 5, Township 8 North, Range 76 West of the 6th P. M. When complete it will have an area at high water line of about 20 acres, will be capable of storing water and regulating the flow thereof to a depth of 35 feet

and will have a storage and regulating capacity of 30,942,000 cubic feet.

The said reservoir, along with the remaining thirteen Link Lakes Reservoirs, has a two fold purpose, to-wit:

1st. As an essential part of the Laramie River System of the claimant when used as an expansion or regulating basin for the collection, diversion, control and proper discharge of the waters of Rawah and McIntyre Creeks, into and through the said Rawah Creek as a carrier, and through the McIntyre, Rawah and Lower Supply Ditches into the Tunnel Reservoir, for conveyance, expansion, accumulation, control and final discharge through the Laramie River Tunnel and into the Cache la Poudre River for diversion from said stream to the lands of the claimant.

2nd. For use in the usual manner as a storage reservoir for the storage of waters for agricultural and other beneficial uses at times other than those when said reservoir [fol. 2844] shall be in use as a regulating or expansion basin, and when used for such purposes the said creeks, ditches, reservoir and tunnel shall be used as outlet, carriage and discharge works for said reservoir.

Said reservoir constitutes an essential part, unit or portion of the entire Laramie River System of the claimant, and, when completed, will be used in conjunction with the remaining units or portions of said system in such manner as to give the maximum diversion, collection, storage and carrying capacity to said system and its various units or parts for the irrigation of 125,000 acres of land.

Work was commenced upon this reservoir, along with the several other units or portions of the said Laramie River System of claimant, on or about August 25, 1902, and has since hitherto been prosecuted with diligence by the claimant and its predecessors in title and interest. Owing to the fact that such reservoir is not as yet completed, and no use thereof has been made for the collection, storage or diversion of waters, no findings in behalf of said reservoir can be made, save as to the number and date of its priority, which is hereby fixed as August 25, 1902, and its priority is numbered Reservoir Priority No. 8. Its appropriation shall not exceed a storage depth of 35 feet above the bottom of the outlet tube and a capacity of 30,942,000 cubic feet, and in addition thereto, the right to use said reservoir

and any or all of its capacity, in conjunction with the other reservoirs and units of said system of irrigation works, and, particularly, The Rawah Ditch, and The Rawah & Lower Supply Ditch, the Tunnel Reservoir and the Laramie River Tunnel, for the better regulation of the flow, delivery and discharge of waters through said units, to the several carrying and regulating capacities of each thereof, as more particularly specified in the findings and decree pertinent to each. Said appropriation shall also be [fol. 2845] limited in said decree to the irrigation of 125,000 acres of land by means of said reservoir and all the other units and portions of the said irrigation system of claimant.

No. 10—The Link Lake Reservoir No. 6

The claimant of this reservoir is The Greeley-Poudre Irrigation District, a quasi-public or municipal corporation, organized and doing business under the laws of the State of Colorado, whose postoffice address is Greeley, Weld County, Colorado.

Said reservoir derives its supply of water, in Water District No. 48, from a branch of Rawah Creek and tributaries thereof entering said stream above the said reservoir. It will be constructed in, upon and across the channel of said branch of Rawah Creek, and has no inlet ditch. It is situate near timber line and at the foot of the snowy range.

Said reservoir is located in Larimer County, Colorado, in part on the N½ of Section 5, Township 8 North, Range 76 West, and in part on the SW¼ of Section 32, Township 9 North, Range 76 West of the 6th P. M. When complete it will have an area at high water line of about 12 acres, will be capable of storing water and regulating the flow thereof to a depth of about 25 feet and will have a storage and regulating capacity of about 13,068,000 cubic feet.

The said reservoir, along with the remaining thirteen Link Lakes Reservoirs, has a two-fold purpose, to-wit:

1st. As an essential part of the Laramie River System of the claimant when used as an expansion or regulating basin for the collection, diversion, control and proper discharge of the waters of Rawah and McIntyre Creeks, into and through the said Rawah Creek as a carrier, and through the McIntyre, Rawah and Lower Supply Ditches [fol. 2846] into the Tunnel Reservoir, for conveyance, ex-

pansion, accumulation, control and final discharge through the Laramie River Tunnel and into the Cache la Poudre River for diversion from said stream to the lands of the claimant.

2nd. For use in the usual manner as a storage reservoir for the storage of waters for agricultural and other beneficial uses at times other than those when said reservoir shall be in use as a regulating or expansion basin, and when used for such purposes the said creeks, ditches, reservoir and tunnel shall be used as outlet, carriage and discharge works for said reservoir.

Said reservoir constitutes an essential part, unit or portion of the entire Laramie River System of the claimant, and, when completed, will be used in conjunction with the remaining units or portions of said system in such manner as to give the maximum diversion, collection, storage and carrying capacity to said system and its various units or parts for the irrigation of 125,000 acres of land.

Work was commenced upon this reservoir, along with the several other units or portions of the said Laramie River System of claimant, on or about August 25, 1902, and has since hitherto been prosecuted with diligence by the claimant and its predecessors in title and interest. Owing to the fact that such reservoir is not as yet completed, and no use thereof has been made for the collection, storage or diversion of waters, no findings in behalf of said reservoir can be made, save as to the number and date of its priority, which is hereby fixed as August 25, 1902, and its priority is numbered Reservoir Priority No. 9. Its appropriation shall not exceed a storage depth of 25 feet above the bottom of the outlet tube and a capacity of 13,- [fol. 2847] 068,000 cubic feet, and in addition thereto, the right to use said reservoir and any or all of its capacity, in conjunction with the other reservoirs and units of said system of irrigation works, and, particularly, The Rawah Ditch, and The Rawah & Lower Supply Ditch, the Tunnel Reservoir and the Laramie River Tunnel, for the better regulation of the flow, delivery and discharge of waters through said units, to the several carrying and regulating capacities of each thereof, as more particularly specified in the findings and decree pertinent to each. Said appropriation shall also be limited in said decree to the irrigation of 125,000 acres of land by means of said reservoir and all

the other units and portions of the said irrigation system of claimant.

No. 11—The Link Lake Reservoir No. 7

The claimant of this reservoir is The Greeley-Poudre Irrigation District, a quasi-public or municipal corporation, organized and doing business under the laws of the State of Colorado, whose postoffice address is Greeley, Weld County, Colorado.

Said reservoir derives its supply of water, in Water District No. 48, from a branch of Rawah Creek and tributaries thereof entering said stream above the said reservoir. It will be constructed in, upon and across the channel of said branch of Rawah Creek, and has no inlet ditch. It is situate near timber line and at the foot of the snowy range.

Said reservoir is located in Larimer County, Colorado, in the NE¼ of Section 5, Township 8 North, Range 76 West of the 6th P. M. When complete it will have an area at high water line of about 11 acres, will be capable of storing water and regulating the flow thereof to a depth of about 40 feet and will have a storage and regulating capacity of 19,166,000 cubic feet.

[fol. 2848] The said reservoir, along with the remaining thirteen Link Lakes Reservoirs, has a two fold purpose, to-wit:

1st. As an essential part of the Laramie River System of the claimant when used as an expansion or regulating basin for the collection, diversion, control and proper discharge of the waters of Rawah and McIntyre Creeks, into and through the said Rawah Creek as a carrier, and through the McIntyre, Rawah and Lower Supply Ditches into the Tunnel Reservoir, for conveyance, expansion, accumulation, control and final discharge through the Laramie River Tunnel and into the Cache la Poudre River for diversion from said stream to the lands of claimant.

2nd. For use in the usual manner as a storage reservoir for the storage of waters for agricultural and other beneficial uses at times other than those when said reservoir shall be in use as a regulating or expansion basin, and when used for such purposes the said creeks, ditches, reservoir and tunnel shall be used as outlet, carriage and discharge works for said reservoir.

Said reservoir constitutes and essential part, unit or portion of the entire Laramie River System of the claimant, and, when completed, will be used in conjunction with the remaining units or portions of said system in such manner as to give the maximum diversion, collection, storage and carrying capacity to said system and its various units or parts for the irrigation of 125,000 acres of land.

Work was commenced upon this reservoir, along with the several other units or portions of the said Laramie River System of claimant, on or about August 25, 1902, and has since hitherto been prosecuted with diligence by the claimant and its predecessors in title and interest. Owing to the fact that such reservoir is not as yet completed, and no use thereof has been made for the collection, storage or diversion of waters, no findings in behalf of said reservoir can be made, save as to the number [fol. 2849] and date of its priority, which is hereby fixed as August 25, 1902, and its priority is numbered Reservoir Priority No. 10. Its appropriation shall not exceed a storage depth of 40 feet above the bottom of the outlet tube and a capacity of 19,166,000 cubic feet, and in addition thereto, the right to use said reservoir and any or all of its capacity, in conjunction with the other reservoirs and units of said system of irrigation works, and, particularly, The Rawah Ditch, and The Rawah & Lower Supply Ditch, the Tunnel Reservoir and the Laramie River Tunnel, for the better regulation of the flow, delivery and discharge of waters through said units, to the several carrying and regulating capacities of each thereof, as more particularly specified in the findings and decree pertinent to each. Said appropriation shall also be limited in said decree to the irrigation of 125,000 acres of land by means of said reservoir and all the other units and portions of the said irrigation system of claimant.

No. 12—The Link Lake Reservoir No. 8

The claimant of this reservoir is The Greeley-Poudre Irrigation District, a quasi-public or municipal corporation, organized and doing business under the laws of the State of Colorado, whose postoffice address is Greeley, Weld County, Colorado.

Said reservoir derives its supply of water, in Water District No. 48, from a branch of Rawah Creek and tribu-

taries thereof, entering said stream above the said reservoir. It will be constructed in, upon and across the channel of said branch of Rawah Creek, and has no inlet ditch. It is situate near timber line and at the foot of the snowy range.

[fol. 2850] Said reservoir is located in Larimer County, Colorado, in the S½ of Section 4, Township 8 North, Range 76 West of the 6th P. M. When complete it will have an area at high water line of about 50 acres, will be capable of storing water and regulating the flow thereof to a depth of about 40 feet, and will have a storage and regulating capacity of 87,120,000 cubic feet.

The said reservoir, along with the remaining thirteen Link Lakes Reservoirs, has a two fold purpose, to-wit:

1st. As an essential part of the Laramie River System of the claimant when used as an expansion or regulating basin for the collection, diversion, control and proper discharge of the waters of Rawah and McIntyre Creeks, into and through the said Rawah Creek as a carrier, and through the McIntyre, Rawah and Lower Supply Ditches into the Tunnel Reservoir, for conveyance, expansion, accumulation, control and final discharge through the Laramie River Tunnel and into the Cache la Poudre River for diversion from said stream to the lands of the claimant.

2nd. For use in the usual manner as a storage reservoir for the storage of waters for agricultural and other beneficial uses at times other than those when said reservoir shall be in use as a regulating or expansion basin, and and when used for such purposes the said creeks, ditches, reservoir and tunnel shall be used as outlet, carriage and discharge works for said reservoir.

Said reservoir constitutes an essential part, unit of portion of the entire Laramie River System of the claimant, and, when completed, will be used in conjunction with the remaining units or portions of said system in such manner as to give the maximum diversion, collection, storage and carrying capacity to said system and its various units or parts for the irrigation of 125,000 acres of land.

[fol. 2851] Work was commenced upon this reservoir, along with the several other units or portions of the said Laramie River System of claimant, on or about August 25, 1902, and has since hitherto been prosecuted with diligence by the claimant and its predecessors in title and

interest. Owing to the fact that such reservoir is not as yet completed, and no use thereof has been made for the collection, storage or diversion of waters, no findings in behalf of said reservoir can be made, save as to the number and date of its priority, which is hereby fixed as August 25, 1902, and its priority is numbered Reservoir Priority No. 11. Its appropriation shall not exceed a storage depth of 40 feet above the bottom of the outlet tube and a capacity of 87,120,000 cubic feet, and in addition thereto the right to use said reservoir and any or all of its capacity, in conjunction with the other reservoirs and units of said system of irrigation works, and, particularly, The Rawah Ditch, and The Rawah & Lower Supply Ditch, the Tunnel Reservoir and the Laramie River Tunnel, for the better regulation of the flow, delivery and discharge of waters through said units, to the several carrying and regulating capacities of each thereof, as more particularly specified in the findings and decree pertinent to each. Said appropriation shall also be limited in said decree to the irrigation of 125,000 acres of land by means of said reservoir and all the other units and portions of the said irrigation system of claimant.

No. 13—The Link Lake Reservoir No. 9

The claimant of this reservoir is The Greeley-Poudre Irrigation District, a quasi-public or municipal corporation, organized and doing business under the laws of the State of Colorado, whose postoffice address is Greeley, Weld County, Colorado.

[fol. 2852] Said reservoir derives its supply of water, in Water District No. 48, from a branch of Rawah Creek and tributaries thereof entering said stream above the said reservoir. It will be constructed in, upon and across the channel of said branch of Rawah Creek, and has no inlet ditch. It is situate near timber line and at the foot of the snowy range.

Said reservoir is located in Larimer County, Colorado, in the NE¼ of Section 6, Township 8 North, Range 76 West of the 6th P. M. When complete it will have an area at high water line of about 25 acres, will be capable of storing water and regulating the flow thereof to a depth of 40 feet and will have a storage and regulating capacity of 25,000,000 cubic feet.

The said reservoir, along with the remaining thirteen Link Lakes Reservoirs, has a two fold purpose, to-wit:

1st. As an essential part of the Laramie River System of the claimant when used as an expansion or regulating basin for the collection, diversion, control and proper discharge of the waters of Rawah and McIntyre Creeks, into and through the said Rawah Creek as a carrier, and through the McIntyre, Rawah and Lower Supply Ditches into the Tunnel Reservoir, for conveyance, expansion, accumulation, control and final discharge through the Laramie River Tunnel and into the Cache la Poudre River for diversion from said stream to the lands of the claimant.

2nd. For use in the usual manner as a storage reservoir for the storage of waters for agricultural and other beneficial uses at times other than those when said reservoir shall be in use as a regulating or expansion basin, and when used for such purposes the said creeks, ditches, reservoir and tunnel shall be used as outlet, carriage and discharge works for said reservoir.

[fol. 2853] Said reservoir constitutes an essential part, unit or portion of the entire Laramie River System of the claimant, and, when completed, will be used in conjunction with the remaining units or portions of said system in such manner as to give the maximum diversion, collection, storage, and carrying capacity to said system and its various units or parts for the irrigation of 125,000 acres of land.

Work was commenced upon this reservoir, along with the several other units or portions of the said Laramie River System of claimant, on or about August 25, 1902, and has since hitherto been prosecuted with diligence by the claimant and its predecessors in title and interest. Owing to the fact that such reservoir is not as yet completed, and no use thereof has been made for the collection, storage or diversion of water, no findings in behalf of said reservoir can be made, save as to the number and date of its priority, which is hereby fixed as August 25, 1902, and its priority is numbered Reservoir Priority No. 12. Its appropriation shall not exceed a storage depth of 40 feet above the bottom of the outlet tube and a capacity of 25,000,000 cubic feet, and in addition thereto, the right to use said reservoir and any or all of its capacity, in conjunction with the other reservoirs and units of said system of irri-

gation works, and, particularly, The Rawah Ditch, and The Rawah & Lower Supply Ditch, the Tunnel Reservoir and the Laramie River Tunnel, for the better regulation of the flow, delivery and discharge of waters through said units, to the several carrying and regulating capacities of each thereof, as more particularly specified in the findings and decree pertinent to each. Said appropriation shall also be limited in said decree to the irrigation of 125,000 acres of land by means of said reservoir and all the other units and portions of the said irrigation system of claimant.

[fol. 2854] No. 14—The Link Lake Reservoir No. 10

The claimant of this reservoir is The Greeley-Poudre Irrigation District, a quasi-public or municipal corporation, organized and doing business under the laws of the State of Colorado, whose postoffice address is Greeley, Weld County, Colorado.

Said reservoir derives its supply of water, in Water District No. 48, from McIntyre Creek and tributaries thereof entering said stream above said reservoir. It will be constructed in, upon and across the channel of said McIntyre Creek and will have no inlet ditch. It is situate at the foot of the snowy range and at timber line.

Said reservoir is located in Larimer County, Colorado, in the NE¼ of Section 31, Township 9 North, Range 76 West of the 6th P. M. When complete it will have an area at high water line of about 14 acres, will be capable of storing water and regulating the flow thereof to a depth of 30 feet and will have a storage and regulating capacity of 18,500,000 cubic feet.

The said reservoir, along with the remaining thirteen Link Lake Reservoirs, has a two fold purpose:

1st. As an essential part of the Laramie River System of the claimant when used as an expansion or regulating basin for the collection, diversion, control and proper discharge of the waters of Rawah and McIntyre Creeks, into and through the said Rawah Creek as a carrier, and through the McIntyre, Rawah and Lower Supply Ditches into the Tunnel Reservoir, for conveyance, expansion, accumulation control and final discharge through the Laramie River Tunnel and into the Cache la Poudre River for diversion from said stream to the lands of the claimant.

2nd. For use in the usual manner as a storage reservoir for the storage of waters for agricultural and other beneficial uses at times other than those when said reservoir [fol. 2855] shall be in use as a regulating or expansion basin, and when used for such purposes the said creeks, ditches, reservoir and tunnel shall be used as outlet, carriage and discharge works for said reservoir.

Said reservoir constitutes an essential part, unit or portion of the entire Laramie River System of the claimant, and, when completed, will be used in conjunction with the remaining units or portions of said system in such manner as to give the maximum diversion, collection, storage and carrying capacity to said system and its various units or parts for the irrigation of 125,000 acres of land.

Work was commenced upon this reservoir, along with the several other units or portions of the said Laramie River System of claimant, on or about August 25, 1902, and has since hitherto been prosecuted with diligence by the claimant and its predecessors in title and interest. Owing to the fact that such reservoir is not as yet completed, and no use thereof has been made for the collection, storage or diversion of waters, no findings in behalf of said reservoir can be made, save as to the number and date of its priority, which is hereby fixed as August 25, 1902, and its priority is numbered Reservoir Priority No. 13. Its appropriation shall not exceed a storage depth of 30 feet above the bottom of the outlet tube, and a storage capacity of 18,500,000 cubic feet, and, in addition thereto, the right to use said reservoir and any or all of its capacity in conjunction with the other reservoirs and units of said system of irrigation works, and, particularly, the McIntyre Ditch, The Rawah Ditch, and The Rawah & Lower Supply Ditch, the Tunnel Reservoir and the Laramie River Tunnel, for the better regulation of the flow, delivery and discharge of waters through said units, to the several carrying and regulating capacities of each thereof, as more particularly specified in the findings and decree pertinent to each. Said ap- [fol. 2856] propriation shall also be limited in said decree to the irrigation of 125,000 acres of land by means of said reservoir and all the other units and portions of the said irrigation system of claimant.

No. 15—The Link Lake Reservoir No. 11

The claimant of this reservoir is The Greeley-Poudre Irrigation District, a quasi-public or municipal corporation, organized and doing business under the laws of the State of Colorado, whose postoffice address is Greeley, Weld County, Colorado.

Said reservoir derives its supply of water, in Water District No. 48, from McIntyre Creek and tributaries thereof entering said stream above said reservoir. It will be constructed in, upon and across the channel of said McIntyre Creek and will have no inlet ditch. It is situate at the foot of the snowy range and at timber line.

Said reservoir is located in Larimer County, Colorado, in the SW¼ of Section 31, Township 9 North, Range 76 West of the 6th P. M. When complete it will have an area at high water line of 35 acres, will be capable of storing water and regulating the flow thereof to a depth of 35 feet and will have a storage and regulating capacity of about 50,000,000 cubic feet.

The said reservoir, along with the remaining thirteen Link Lakes Reservoirs, has a two fold purpose, to-wit:

1st. As an essential part of the Laramie River System of the claimant when used as an expansion or regulating basin for the collection, diversion, control and proper discharge of the waters of Rawah and McIntyre Creeks, into and through the said Rawah Creek as a carrier, and through the McIntyre, Rawah and Lower Supply Ditches into the Tunnel Reservoir, for conveyance, expansion, accumulation, control and final discharge through the Laramie River [fol. 2857] Tunnel and into the Cache la Poudre River for diversion from said stream to the lands of the claimant.

2nd. For use in the usual manner as a storage reservoir for the storage of waters for agricultural and other beneficial uses at times other than those when said reservoir shall be in use as a regulating or expansion basin, and when used for such purposes the said creeks, ditches, reservoir and tunnel shall be used as outlet, carriage and discharge works for said reservoir.

Said reservoir constitutes an essential part, unit or portion of the entire Laramie River System of the claimant, and, when completed, will be used in conjunction with the

remaining units or portions of said system in such manner as to give the maximum diversion, collection, storage and carrying capacity to said system and its various units or parts for the irrigation of 125,000 acres of land.

Work was commenced upon this reservoir, along with the several other units or portions of the said Laramie River System of claimant, on or about August 25, 1902, and has since hitherto been prosecuted with diligence by the claimant and its predecessors in title and interest. Owing to the fact that such reservoir is not as yet completed, and no use thereof has been made for the collection, storage or diversion of waters, no findings in behalf of said reservoir can be made, save as to the number and date of its priority, which is hereby fixed at August 25, 1902, and its priority is numbered Reservoir Priority No. 14. Its appropriation shall not exceed a storage depth of 35 feet above the bottom of the outlet tube, and a storage capacity of 50,000,000 cubic feet, and, in addition thereto, the right to use said reservoir and any or all of its capacity [fol. 2858] in conjunction with the other reservoirs and units of said system of irrigation works, and, particularly, the McIntyre Ditch, The Rawah Ditch, and The Rawah & Lower Supply Ditch, the Tunnel Reservoir and the Laramie River Tunnel, for the better regulation of the flow, delivery and discharge of waters through said units, to the several carrying and regulating capacities of each thereof, as more particularly specified in the findings and decree pertinent to each. Said appropriation shall also be limited in said decree to the irrigation of 125,000 acres of land by means of said reservoir and all the other units and portions of the said irrigation system of claimant.

No. 16—The Link Lake Reservoir No. 12

The claimant of this reservoir is The Greeley-Poudre Irrigation District, a quasi-public or municipal corporation, organized and doing business under the laws of the State of Colorado, whose postoffice address is Greeley, Weld County, Colorado.

Said reservoir derives its supply of water, in Water District No. 48, from a branch of Rawah Creek and tributaries thereof entering said stream above the said reservoir. It will be constructed in, upon and across the channel of said

branch of Rawah Creek, and has no inlet ditch. It is situate near timber line and at the foot of the snowy range.

Said reservoir is located in Larimer County, Colorado, in the NW¼ of Section 4, Township 8 North, Range 76 West of the 6th P. M. When complete it will have an area at high water line of 14 acres, will be capable of storing water and regulating the flow thereof to a depth of 10 feet and will have a storage and regulating capacity of about 6,000,000 cubic feet. This reservior is sometimes known as "Camp Lake."

[fol. 2859] The said reservoir, along with the remaining thirteen Link Lakes Reservoirs, has a two fold purpose, to-wit:

1st. As an essential part of the Laramie River System of the claimant when used as an expansion or regulating basin for the collection, control and proper discharge of the waters of Rawah and McIntyre Creeks, into and through the said Rawah Creek as a carrier, and through the McIntyre, Rawah and Lower Supply Ditches into the Tunnel Reservoir, for conveyance, expansion, accumulation, control and final discharge through the Laramie River Tunnel and into the Cache la Poudre River for diversion from said stream to the lands of the claimant.

2nd. For use in the usual manner as a storage reservoir for the storage of waters for agricultural and other beneficial uses at times other than those when said reservoir shall be in use as a regulating or expansion basin, and when used for such purposes the said creeks, ditches, reservoir and tunnel shall be used as outlet, carriage and discharge works for said reservoir.

Said reservoir constitutes an essential part, unit or portion of the entire Laramie River System of the claimant, and, when completed, will be used in conjunction with the remaining units or portions of said system in such manner as to give the maximum diversion, collection, storage and carrying capacity to said system and its various units or parts for the irrigation of 125,000 acres of land.

Work was commenced upon this reservoir, along with the several other units or portions of the said Laramie River System of claimant, on or about August 25, 1902, and has since hitherto been prosecuted with diligence by the claimant and its predecessors in title and interest. Owing

to the fact that such reservoir is not as yet completed, and no use thereof has been made for the collection, storage [fol. 2860] or diversion of waters, no findings in behalf of said reservoir can be made, save as to the number and date of its priority, which is hereby fixed as August 25, 1902, and its priority is numbered Reservoir Priority No. 15. Its appropriation shall not exceed a storage depth of 10 feet above the bottom of the outlet tube and a capacity of 6,000,000 cubic feet, and in addition thereto the right to use said reservoir and any or all of its capacity, in conjunction with the other reservoirs and units of said system of irrigation works, and, particularly, The Rawah & Lower Supply Ditch, the Tunnel Reservoir and the Laramie River Tunnel, for the better regulation of the flow, delivery and discharge of waters through said units, to the several carrying and regulating capacities of each thereof, as more particularly specified in the findings and decree pertinent to each. Said appropriation shall also be limited in said decree to the irrigation of 125,000 acres of land by means of said reservoir and all the other units and portions of the said irrigation system of claimant.

No. 17—The Link Lake Reservoir No. 13

The claimant of this reservoir is The Greeley-Poudre Irrigation District, a quasi-public or municipal corporation, organized and doing business under the laws of the State of Colorado, whose postoffice address is Greeley, Weld County, Colorado.

Said reservoir derives its supply of water, in Water District No. 48, from a branch of Rawah Creek and tributaries thereof entering said stream above the said reservoir. It will be constructed in, upon and across the channel of said [fol. 2861] branch of Rawah Creek, and has no inlet ditch. It is situate near timber line and at the foot of the snowy range.

Said reservoir is located in Larimer County, Colorado, in the NE¼ of Section 29, Township 9 North, Range 76 West of the 6th P. M. When complete it will have an area at high water line of 60 acres and will be capable of storing water and regulating the flow thereof to a depth of 10 feet and will have a storage and regulating capacity of about 26,000,000 cubic feet.

The said reservoir, along with the remaining thirteen Link Lakes Reservoirs, has a two fold purpose, to-wit:

1st. As an essential part of the Laramie River System of the claimand when used as an expansion or regulating basin for the collection, diversion, control and proper discharge of the waters of Rawah and McIntyre Creeks, into and through the said Rawah Creek as a carrier, and through the McIntyre, Rawah and Lower Supply Ditches into the Tunnel Reservoir, for conveyance, expansion, accumulation, control and final discharge through the Laramie River Tunnel and into the Cache la Poudre River for diversion from said stream to the lands of the claimant.

2nd. For use in the usual manner as a storage reservoir for the storage of waters for agricultural and other beneficial uses at times other than those when said reservoir shall be in use as a regulating or expansion basin, and when used for such purposes the said creeks, ditches, reservoir and tunnel shall be used as outlet, carriage and discharge works for said reservoir.

Said reservoir constitutes an essential part, unit, or portion of the entire Laramie River System of the claimant, and, when completed, will be used in conjunction with the remaining units or portions of said system in such manner as to give the maximum diversion, collection, storage and carrying capacity to said system and its various units or [fol. 2862] parts for the irrigation of 120,000 acres of land.

Work was commenced upon this reservoir, along with the several other units or portions of the said Laramie River System of claimant, on or about August 25, 1902, and has since hitherto been prosecuted with diligence by the claimant and its predecessors in title and interest. Owing to the fact that such reservoir is not as yet completed, and no use thereof has been made for the collection, storage or diversion of waters, no findings in behalf of said reservoir can be made, save as to the number and date of its priority, which is hereby fixed as August 25, 1902, and its priority is numbered Reservoir Priority No. 16. Its appropriation shall not exceed a storage depth of 10 feet above the bottom of the outlet tube and a capacity of 26,000,000 cubic feet, and in addition thereto, the right to use said reservoir and any or all of its capacity, in conjunction with the other reservoirs and units of said system of irrigation works,

and, particularly, The Rawah & Lower Supply Ditch, the Tunnel Reservoir and the Laramie River Tunnel, for the better regulation of the flow, delivery and discharge of waters through said units, to the several carrying and regulating capacities of each thereof, as more particularly specified in the findings and decree pertinent to each. Said appropriation shall also be limited in said decree to the irrigation of 125,000 acres of land by means of said reservoir and all the other units and portions of the said irrigation system of claimant.

[fol. 2863] No. 18—The Link Lake Reservoir No. 14

The claimant of this reservoir is The Greeley-Poudre Irrigation District, a quasi-public or municipal corporation, organized and doing business under the laws of the State of Colorado, whose postoffice address is Greeley, Weld County, Colorado.

Said reservoir derives its supply of water, in Water District No. 48, from Spring Creek, a branch and tributary of Rawah Creek, and tributaries of said Spring Creek entering said stream above said reservoir. It will be constructed in, upon and across the channel of said Spring Creek and has no inlet ditch.

Said reservoir is located in Larimer County, Colorado, in the NE¼ of Section 29, Township 9 North, Range 76 West of the 6th P. M. When complete it will have an area at high water line of about 50 acres, will be capable of storing water and regulating the flow thereof to a depth of 21 feet and will have a storage and regulating capacity of about 26,000,000 cubic feet.

The said reservoir, along with the remaining thirteen Link Lakes Reservoirs, has a two fold purpose, to-wit:

1st. As an essential part of the Laramie River System of the claimant when used as an expansion or regulating basin for the collection, diversion, control and proper discharge of the waters of Rawah and McIntyre Creeks, into and through the said Rawah Creek as a carrier, and through the McIntyre, Rawah and Lower Supply Ditches into the Tunnel Reservoir, for conveyance, expansion, accumulation, control and final discharge through the Laramie River Tunnel and into the Cache la Poudre River for diversion from said stream to the lands of the claimant.

2nd. For use in the usual manner as a storage reservoir for the storage of waters for agricultural and other beneficial uses at times other than those when said reservoir [fol. 2864] shall be in use as a regulating or expansion basin, and when used for such purposes the said creeks, ditches, reservoir and tunnel shall be used as outlet, carriage and discharge works for said reservoir.

Said reservoir constitutes an essential part, unit or portion of the entire Laramie River System of the claimant, and, when completed, will be used in conjunction with the remaining units or portions of said system in such manner as to give the maximum diversion, collection, storage and carrying capacity to said system and its various units or parts for the irrigation of 125,000 acres of land.

Work was commenced upon this reservoir, along with the several other units or portions of the said Laramie River System of claimant, on or about August 25, 1902, and has since hitherto been prosecuted with diligence by the claimant and its predecessors in title and interest. Owing to the fact that such reservoir is not as yet completed, and no use thereof has been made for the collection, storage or diversion of waters, no findings in behalf of said reservoir can be made, save as to the number and date of its priority, which is hereby fixed as August 25, 1902, and its priority is numbered Reservoir Priority No. 17. Its appropriation shall not exceed a storage depth of 12 feet above the bottom of the outlet tube and capacity of 26,000,000 cubic feet, and in addition thereto, the right to use said reservoir and any or all of its capacity, in conjunction with the other reservoirs and units of said system of irrigation works, and, particularly, The Rawah & Lower Supply Ditch, the Tunnel Reservoir and the Laramie River Tunnel, for the better regulation of the flow, delivery and discharge of waters through said units, to the several carrying and regulating capacities of each thereof, as more particularly specified in the findings and decree pertinent [fol. 2865] to each. Said appropriation shall also be limited in said decree to the irrigation of 125,000 acres of land by means of said reservoir and all the other units and portions of the said irrigation system of claimant.

No. 19—The Tunnel Reservoir of the Laramie River System

The claimant of this reservoir is The Greeley-Poudre Irrigation District, a quasi-public or municipal corporation, organized and doing business under the laws of the State of Colorado, whose postoffice address is Greeley, Weld County, Colorado.

Water is received into said reservoir from the Laramie River and the West Fork of the Laramie River, also, from McIntyre, Rawah, West Springer, Rapid, Winifred, Fall, Mill, Deadman, Nunn, Porter, Brinker, East Springer, Half Mile and various other creeks tributary to the Laramie River below the mouth of the West Fork and from the various tributaries of each of said streams entering the Laramie River and the West Fork of the Laramie River above the Tunnel Reservoir or said other streams above the lines of The Lower Rawah & Supply and the Deadman and Nunn Creek Ditches. Said reservoir is in process of construction, in, upon and across the channel of the Laramie River immediately below the mouth of the West Fork of the Laramie River.

Said reservoir, insofar as the collection, accumulation, storage, diversion and carriage of the waters of the Laramie River and West Fork of the Laramie River and all tributaries of either thereof, above and southerly from the dam of said reservoir, has no inlet ditch, each of said streams serving as an inlet for the carriage of water to and into said reservoir. The Rawah Ditch, The Rawah & Lower Supply Ditch and The Deadman and Nunn Creek [fol. 2866] Ditch severally and collectively serve as inlets to said reservoir, for the purpose of diverting waters from the various creeks by said ditches intersected and conveying the same to and into said reservoir, as will more particularly appear in the findings and decree herein pertinent to said ditches.

Said reservoir is located in Larimer County, Colorado, in Sections Six (6) and Seven (7), Township Eight (8) North, Range Seventy-five (75) West of the 6th P. M., and Section One (1), Township Eight (8) North, Range Seventy-six (76) West of the 6th P. M. When complete it will have an area at high water line of about 217 acres and will be capable of storing and regulating the flow of water to a

depth of 33 feet and will have a storage and regulating capacity of 170,000,000 cubic feet. It is an essential unit or part of the entire collection, storage, diversion and carriage system of irrigation works of the claimant for the collection, diversion, control, temporary accumulation and proper discharge of the waters of the Laramie River and its several tributaries diverted and controlled by said system, and finally discharged and conveyed through the Laramie River Tunnel. The said reservoir is located at the west portal of said tunnel and will be used as an equalization or expansion basin, for the regulation of the flow of the waters of the Laramie River, or the West Fork of the Laramie River, and the waters delivered and diverted thereinto by the several other units of the system, and, particularly, the three collection ditches aforesaid, to, into and through the said Laramie River Tunnel, so as to obtain the greatest diversion, use and benefit of the flow and discharge of waters [fol. 2867] from the said irrigation works of the claimant. It constitutes the general and final equalizing and regulating basin and receptacle of all of the waters collected, diverted, stored, discharged and carried through the irrigation system of the claimant upon the Laramie River, save and except the diversion made by the Laramie River Tunnel when operated as a separate unit, and the quantity of water in said reservoir will increase and decrease from time to time with the delivery of water into and discharge through the Laramie River Tunnel, from said reservoir. It will be used in conjunction with the remaining units or portions of said system for the irrigation of 125,000 acres of land.

No separate priority will be awarded said reservoir, but, owing to the functions which it will perform, it will be considered as a unit or part of the entire Laramie River System of the claimant and its priority shall be considered as merged into the priority and appropriation of the Laramie River Tunnel as well as of the remainder of said system of works, and when considered as such unit or part of said system it shall never be used to exceed a storage depth of 33 feet above the bottom of the outlet tube and a capacity of 170,000,000 cubic feet, with the right to use any or all of its capacity from time to time and throughout the year in conjunction with the other reservoirs and units of said system of irrigation works, for the better regulation of the flow, delivery and discharge of water through the several

units, or any thereof, to the several carrying and regulating capacities of each thereof, as more particularly specified in the findings and decree pertinent to each of such units, in such manner as to obtain from said system and each of the units the maximum efficiency and maximum collection, diversion, storage, carriage and discharge capacity for the [fol. 2868] irrigation of 125,000 acres of land.

No. 20—The Laramie River Reservoir

The claimant of this reservoir is The Greeley-Poudre Irrigation District, a quasi-public or municipal corporation, organized and doing business under the laws of the State of Colorado, whose postoffice address is Greeley, Weld County, Colorado.

Said reservoir derives its supply of water, in Water District No. 48, from the Laramie River and all tributaries thereof entering said stream above the location of the dam of said reservoir. It will be constructed in, upon and across the channel of the Laramie River and has no inlet ditch.

It is located in Larimer County, Colorado, on portions of Sections One (1), Two (2), Three (3), Eleven (11), Twelve (12) and Fourteen (14), Township Nine (9) North, Range Seventy-six (76) West and in small part upon Section Thirty-five (35), Township Ten (10) North, of Range Seventy-six (76) West of the 6th P. M. When complete it will have an area at high water line of about 1200 acres, will be capable of storing water 80 feet in depth and will have a storage capacity of 1,940,000,000 cubic feet. It will be completed and used for the storage of water for irrigation purposes and, also, for the regulation of the flow of water in the Laramie River, for the purpose of supplying the needs of all appropriators below its outlet, as well as for supplying water for the irrigation of the lands of claimant situate in the valley of the Laramie River northerly from said reservoir. When used for the purpose of regula- [fol. 2869] tion of flow, the water therein stored will be at times used to make up temporary shortages or deficiencies, if any, in the flow of the stream. Work was commenced by survey on this reservoir on or about the 6th day of April, A. D. 1908, and was thereafter prosecuted with due diligence in connection with other surveys and construction upon the various works of the claimant. The site of said reservoir,

save that portion situate upon government lands, has been acquired by the claimant and its predecessors. Actual construction upon the dam of said reservoir has been prevented owing to failure of the claimant and its predecessors to obtain right of way and easement from the United States for the location of the dam upon portions of Section Thirty-five (35). Owing to the fact that the reservoir is not as yet complete and no use thereof has been made for the storage or diversion of water, no findings in behalf of said reservoir can be made, save as to the number and date of its priority, which is hereby fixed as April 6, A. D. 1908, and its priority is numbered Reservoir No. 18. Its appropriation shall not exceed a storage depth of 80 feet above the bottom of its outlet tube and a capacity of 1,940,000,000 cubic feet.

[fol. 2870] IN THE DISTRICT COURT

STATE OF COLORADO,
County of Larimer, ss:

In the Matter of the Adjudication of the Priority of Right to the Use of Water for Irrigation in Water District No. 48, State of Colorado

Decree

Now on this 20th day of February. A. D. 1914, this matter coming on for a final hearing and adjudication upon the report of L. R. Temple, Referee appointed herein, to whom this matter was by order of this Court, herein entered on the 7th day of October, A. D. 1910, referred for the purposes in said order mentioned as well upon the several findings upon the evidence produced in this matter, as upon the said evidence taken by and before said referee, and the Court being satisfied, from the several returns of notices, certificates of publication, affidavits and certificates of said Referee, respectively, that the said testimony returned, and upon which the findings herein returned have severally been made, was taken upon due and lawful notice, in all respects according to the provisions of the statute in such case made and provided and the rules and several orders of this Court in that behalf in this matter made and entered; and further that the notice of the time set for filing exceptions in this matter to the report and findings, and of the time set for final hearing thereof and this cause, having duly served on all the parties entitled to notice under the order

of this Court in that behalf entered, in manner and form as by said order required; and further, that all interested in this matter and entitled to notice in any stage of the pro-
[fol. 2871] ceedings herein, have at all times been duly notified according to law and order of this Court; and the report of the said referee, together with the returns of service of notices, affidavits, abstract and findings, being found in due form, and the Court having now here in open Court heard all parties and their attorneys so far as they desired to be heard, respectively, touching the several matters herein, it is by the Court, in consideration of the premises, hereby ordered and adjudged that the several findings of the said referee, as reported to and filed in this Court, be in all things approved and confirmed, and that they be taken, deemed and held in all respects as the findings of this Court in this matter.

Subject, however, to the following next mentioned provisions, to-wit:

No. 1. No part of this decree shall in any case be taken, deemed or held to confirm, impair or in any manner affect any claim of right or property held or claimed by any person, or any part thereof, or the land or any part thereof on which any such ditch, canal or reservoir may be situated, or the land held or claimed as a right of way of any of them, or any right, interest or claim of property whatever, in or relating to any of them.

No. 2. No part of this decree shall be taken, deemed or held as affecting in any manner any question or claim of right between the owners or claimants of any such ditch, canal or reservoir, as between each other, whether as part owners or shareholders therein, or as stockholders in any corporation or joint stock company claiming or to claim the same or any part thereof, nor shall it affect the rights, interests or claims of any consumers of water for irrigation
[fol. 2872] or domestic purposes, whether as part owner, lessee, shareholders or stockholder in any corporation holding or controlling the same, or as purchasers of water therefrom, as against the rights, interests or claims of any other party or parties interested or claiming interest or rights in or to such ditch, canal or reservoir as owner, lessee or part owner thereof, or as shareholder or stockholder in any corporation claiming the same or as purchaser of water therefrom. Neither shall it affect any claim of priority

made or resisted as between parties using water for said ditch, canal or reservoir, as to such water.

3. No part of this decree shall in any manner affect any question between two or more parties claiming or owning priorities as herein adjudged, on the same stream, in any case where the water in such stream sinks and rises to the surface again between the locations of the headgates of their respective ditches or canals, or in any dispute as to the identity of the water appropriated by either party or of such sinking and rising stream.

4. This decree shall not affect any question of priority between claimants or owners of ditches or canals used in whole or in part for milling or manufacturing or water power for other purposes as to any water carried in such ditches or canals for said purposes.

5. This decree shall not affect any claim, interest or right of any corporation as to the right of property in any ditch, canal or reservoir, or the ground on which the same may be situated, or any question which may arise between the stockholders thereof or between them and the State, people or any party, upon the dissolution of such corporation by expiration of its charter or otherwise, as to any ap- [fol. 2873] propriation of water or rights secured by condemnation proceeding by such corporation during its legal existence.

6. No part of this decree shall affect in any way any right, claim or interest now or hereafter held or claimed to any appropriation of water made after the closing of the testimony touching the construction or enlargements of the ditch, canal or reservoir by means of which such appropriation may have been made.

7. No part of this decree shall be taken, deemed, or held as adjudging to any claimant or present or future representative of any claim to any ditch or canal or reservoir, or party holding, using or controlling the same, any right to take and carry by means of any ditch, canal or reservoir herein mentioned, or by virtue of any appropriation herein adjudged, any water from any natural stream except to be applied to the use for which such appropriation has been made; nor to allow any excessive use or waste of water whatever; nor to allow any diversion of water ex-

cept for lawful and beneficial uses and in no event shall the appropriations awarded priorities for irrigation of lands within Water District No. 48 be used to irrigate any acreage in excess of that fixed in this decree.

8. This decree shall be taken, deemed and held as intended to determine and establish the several priorities of right by appropriation of water from the streams of said Water District No. 48, for irrigation, of the several ditches, canals and reservoirs in said District, concerning which testimony has been offered in this matter, each according to the construction, enlargement or extension thereof, with the amount of water held to have been appropriated thereby.

All priorities first awarded in this decree which are adjudged to have taken effect on the same date are of equal [fol. 2874] seniority as to each other, regardless of the different numbers that may have been given in this decree. Dates of taking effect of appropriations shall control rather than numbers fixed to the priorities, with the exception that all agricultural appropriations herein decreed priorities are subject to the lowest priority awarded in Decree in this matter entered October 11, 1906.

9. No part of this decree shall be taken, deemed or held as adjudging to any claimant or present or future representative of any claim to any ditch, canal, reservoir using water for irrigation of lands situate in the Laramie River Valley within Water District No. 48, or party holding, using or controlling the same, any right, to the use of water for a period in excess of 75 days in each and every year, and such period is hereby fixed as beginning not earlier than the 15th day of May, and ending not later than the 1st day of August, of each year.

Subject to the several last mentioned nine provisions, it is further, as to said ditches, canals, and reservoirs, and the several appropriations of water by means of them respectively claimed in this matter, ordered, adjudged and decreed as in and by the findings of said Referee is found, as follows:

That said ditches be, and the same are hereby, numbered according to the date of their several and respective constructions, and said dates are hereby determined and declared to be as follows:

[fol. 2875]

Ditch No.	Name of Ditch	Date Appropriation	Priority No.
65	John Goetz Ditch No. 1	June 1, 1879	60
62	Ollie Ditch	June 1, 1886	61

[fol. 2877] No. 55—The Brinker Creek Ditch

This ditch, numbered 55, named The Brinker Creek Ditch, Watson Zeigler, George A. Webb and S. E. Eddy, claimants, is a ditch constructed and used for the irrigation of 40 acres of land; it draws its supply of water from Brinker Creek with its headgate located at a point in the Southwest Quarter (SW¼) of the Southeast Quarter (SE¼) of Section Twenty four (24) Township Nine (9) North, Range 76, whence the southeast corner of Section 24 bears east 68 degrees and 10 minutes 1374 feet, and entitled by appropriation to use of water from said stream to Priority No. 67., by construction thereof and thereby to the quantity of water with the number and date of the priority of appropriation thereof, hereinafter mentioned, for the use aforesaid and for the benefit of the party or parties lawfully entitled thereto; it is hereby adjudged and decreed that there be allowed to flow into said ditch from said stream for the use and benefit aforesaid under and by virtue of said appropriation by construction, Priority No. 67, eight cubic feet of water per second of time, or so much thereof as may be necessary to irrigate forty acres of land, the appropriation of which water took effect on, and said priority dates from the 10th day of July, 1901, but said date is limited as set forth in the findings for said ditch herein, and in paragraph 8 of this decree.

[fol. 2878] No. 56—The Pine Creek Ditch

That ditch numbered 56, named the Pine Creek Ditch, Samuel O. Shipp claimant, is a ditch constructed and used for the irrigation of 75 acres of land; it draws its supply of water from Pine Creek with its headgate located at a point which bears south 49 degrees, 22 minutes west 2562 feet from the quarter corner of the east side of Section 20, Township 10, N. Range 76 W., and entitled by appropriation to use of water from said stream to Priority No. 70, by construction thereof and thereby to the quantity of water, with the number and date of the priority of appropriation thereof, hereinafter mentioned, for the use aforesaid and for the benefit of the party or parties lawfully entitled thereto, it is hereby adjudged and decreed that there be allowed to flow into said ditch from said stream for the use

and benefit aforesaid under and by virtue of said appropriation by construction, Priority No. 70, four cubic feet of water per second of time, or so much thereof as may be necessary to irrigate 75 acres of land, the appropriation of which water took effect on, and said priority dates from the 20th day of August, 1902.

No. 57—The Pine Creek Ditch Extension

That ditch numbered 57, named the Pine Creek Ditch Extension, Samuel O. Shipp, R. E. Moan and J. F. Moan, claimants, is a ditch constructed and used for the irrigation of 60 acres of land; it draws its supply of water from Pine Creek with its headgate identical with the headgate of the Pine Creek Ditch, to-wit, at a point which bears south [fol. 2879] 49 degrees, 22 minutes west 2562 feet from the quarter corner on the east side of Section 20, Township 10, N. Range 76 West, and is an extension of the said, The Pine Creek Ditch, and entitled by appropriation to use of water from said stream to Priority No. 87, by construction thereof and thereby to the quantity of water with the number and date of the priority of appropriation thereof, hereinafter mentioned, for the use aforesaid and for the benefit of the party or parties lawfully entitled thereto; it is hereby adjudged and decreed that there be allowed to flow into said ditch from said stream for the use and benefit aforesaid under and by virtue of said appropriation by construction, Priority No. 87, 1.75 cubic feet of water per second of time, or so much thereof as may be necessary to irrigate 60 acres of land, the appropriation of which water took effect on, and said priority dates from the 8th day of July, 1911.

No. 58—The McIntyre Ditch

That ditch numbered 58, named the McIntyre Ditch, R. E. Moan, J. F. Moan and Samuel O. Shipp, claimants, is a ditch constructed and used for the irrigation of 140 acres of land; it draws its suppy of water from McIntyre Creek with its headgate located at a point which bears south 28 degrees, 20 minutes west 635 feet from the quarter corner on the east side of Section 20, Township 10, N. Range 76 West, and entitled by appropriation to use of water from said stream to Priority No. 81, by construction thereof and thereby to the quantity of water with the number and date of the priority of appropriation thereof, hereinafter men-

[fol. 2880] tioned, for the use aforesaid and for the benefit of the party or parties lawfully entitled thereto; it is hereby adjudged and decreed that there be allowed to flow into said ditch from said stream for the use and benefit aforesaid under and by virtue of said appropriation by construction, Priority No. 81, seven cubic feet of water per second of time, or so much thereof as may be necessary to irrigate 140 acres of land, the appropriation of which water took effect on, and said priority dates from the 25th day of July, A. D. 1908.

No. 59—The Nellie Ditch

That ditch numbered 59, named the Nellie Ditch, Mrs. Nellie Thompson claimant, is a ditch constructed and used for the irrigation of about 200 acres in conjunction with the Thompson Ditch; it draws its supply of water from McQuire Creek with its headgate located at a point which bears south 31 degrees, 27 minutes west 1228 feet from the Northwest corner of Section 1, Township 10 N., Range 77 West of the 6th P. M., and entitled by appropriation to use of water from said stream Priority No. 76, by construction thereof and thereby to the quantity of water with the number and date of the priority of appropriation thereof, hereinafter mentioned, for the use aforesaid and for the benefit of the party or parties lawfully entitled thereto; it is hereby adjudged and decreed that there be allowed to flow into said ditch from said stream for the use and benefit aforesaid under and by virtue of said appropriation by construction, Priority No. 76, 15.3 cubic feet of water per second of time, or so much thereof as may be necessary to irrigate two hundred acres of land, in conjunction with the Thompson Ditch, the appropriation of which water took effect on, and said priority dates from the 10th day Septem-
[fol. 2881] ber, 1903.

No. 60—The Timothy Ditch

That ditch numbered 60, named the Timothy Ditch, Hannah Mansfield and Elton Mansfield and John Mansfield claimants, is a ditch constructed and used for the irrigation of about 200 acres of land; it draws its supply of water from the Big Laramie River, with its headgate located at a point south 21 degrees west 39 chains and 68 links from the north quarter corner of Section 23, Township 10, North,

Range 76 West of the 6th P. M., and is entitled by appropriation to use of water from said stream to Priority No. 77, by construction thereof and thereby to the quantity of water with the number and date of the priority of appropriation thereof, hereinafter mentioned, for the use aforesaid and for the benefit of the party or parties lawfully entitled thereto; it is hereby adjudged and decreed that there be allowed to flow into said ditch from said stream for the use and benefit aforesaid under and by virtue of said appropriation by construction, Priority No. 77, 34.36 cubic feet of water per second of time, or so much thereof as may be necessary to irrigate two hundred acres of land, the appropriation of which water took effect on, and said priority dates from the 5th day of July, 1904.

No. 61—Grace Creek Ditch, Second Enlargement

That ditch numbered 61, named the Grace Creek Ditch, Second Enlargement, Everett D. Bullard claimant, is a [fol. 2882] ditch constructed and used for the irrigation of about 480 acres of land that is as used in conjunction with the priorities for this ditch by original construction, and by first enlargement; it draws its supply of water from Grace Creek, a tributary of the Big Laramie River with its headgate located on the left bank of Grace Creek a tributary of the Big Laramie River on the Northwest quarter of the Northwest quarter of Section 14, Township 11, N. Range 77 West of the 6th P. M., at a point south 37 degrees, 45 minutes east 574 feet from the Northwest corner of said Section 14, and entitled by appropriation to use of water from said stream to Priority No. 80 by construction thereof and thereby to the quantity of water with the number and date of the priority of appropriation thereof, hereinafter mentioned, for the use aforesaid and for the benefit of the party or parties lawfully entitled thereto; it is hereby adjudged and decreed that there be allowed to flow into said ditch from said stream for the use and benefit aforesaid under and by virtue of said appropriation by construction, Priority No. 80, ten cubic feet of water per second of time, or so much thereof as may be necessary to irrigate 480 acres of land, that in conjunction with the priorities for this ditch by original construction and by first enlargement, the appropriation of which water took effect on, and said priority dates from the 1st day of April, 1907.

No. 62—The Ollie Ditch

That ditch numbered 62, named The Ollie Ditch, Elton Mansfield, claimant, is a ditch constructed and used for the irrigation of 60 acres of land; it draws its supply of water from Jimmy Creek, with its headgate located at a point on [fol. 2883] the west bank of Jimmy Creek, a tributary of the Big Laramie River, south 13 degrees, 33 minutes east 1730 feet from the west quarter corner of Section 27, Township 11, North Range 76 West of the 6th P. M., and entitled by appropriation to use of water from said stream to Priority No. 61, by construction thereof and thereby to the quantity of water with the number and date of the priority of appropriation thereof, hereinafter mentioned, for the use aforesaid, and for the benefit of the party or parties lawfully entitled thereto;

It is hereby adjudged and decreed that there be allowed to flow into said ditch from said stream for the use and benefit aforesaid under and by virtue of said appropriation by construction, Priority No. 61, 3.45 cubic feet of water per second of time, or so much thereof as may be necessary to irrigate 60 acres of land, the appropriation of which water took effect, on, and said priority dates from the 1st day of June, 1886, but said date is limited as set forth in the findings for said ditch herein, and in paragraph 8 of this decree.

No. 63—The La Garde Ditch Enlargement

That ditch numbered 63, named The La Garde Ditch Enlargement, J. H. Detro, T. Forrester and Thomas Tatham, claimants, is a ditch constructed and used for the irrigation of 215 acres of land; it draws its supply of water from La Garde Creek, with its headgate located at a point identical with the headgate of the La Garde Ditch, having Priority No. 11, of date June 10th 1883, and entitled by appropriation to use of water from said stream to Priority No. [fol. 2884] 64, by enlargement thereof and thereby to the quantity of water with the number and date of the priority of appropriation thereof, hereinafter mentioned, for the use aforesaid, and for the benefit of the party or parties lawfully entitled thereto;

It is hereby adjudged and decreed that there be allowed to flow into said ditch from said stream for the use and

benefit aforesaid under and by virtue of said appropriation by enlargement, Priority No. 64, 4.87 cubic feet of water per second of time, or so much thereof as may be necessary to irrigate 215 acres of land, the appropriation of which water took effect, on, and said priority dates from the 1st day of June, 1896, but said date is limited as set forth in the findings for said ditch herein, and in paragraph 8 of this decree.

No. 64—Jimmy Creek Ditch Enlargement

That ditch numbered 64, named the Jimmy Creek Ditch Enlargement, Thomas Tatham, claimant, is a ditch constructed and used for the irrigation of 200 acres of land; it draws its supply of water from the east bank of Jimmy Creek and from the east bank of the Big Laramie River, with its headgates located at a point identical with the headgates of the Jimmy Creek Ditch, having Priority No. 14, of date June 1st, 1884, and entitled by appropriation to use of water from said stream to Priority No. 65, by enlargement thereof and thereby to the quantity of water with the number and date of the priority of appropriation thereof, hereinafter mentioned, for the use aforesaid, and for the benefit of the party of parties lawfully entitled thereto;
[fol. 2885] It is hereby adjudged and decreed that there be allowed to flow into said ditch from said stream for the use and benefit aforesaid under and by virtue of said appropriation by construction, Priority No. 65, 9.48 cubic feet of water per second of time, by enlargement or so much thereof as may be necessary to irrigate 200 acres of land, the appropriation of which water took effect, on and said priority dates from the 2nd day of June, 1896, but said date is limited as set forth in the findings for said ditch herein, and in paragraph 8 of this decree.

No. 65—The John Goetz Ditch No. 1

That ditch numbered 65, named The John Goetz Ditch No. 1, E. M. Hohnholz, claimant, is a ditch constructed and used for the irrigation of 100 acres of land; it draws its supply of water from Shell Creek, a tributary of Sand Creek, with its headgate located at a point on the right bank of Shell Creek whence the southwest corner of Section 24, Township 12, N. Range 76 West of the 6th P. M., bears south 52 degrees, 5 minutes west 1745 feet, and en-

titled by appropriation to use of water from said stream to Priority No. 60, by construction thereof and thereby to the quantity of water with the number and date of the priority of appropriation thereof, hereinafter mentioned, for the use aforesaid, and for the benefit of the party or parties lawfully entitled thereto;

It is hereby adjudged and decreed that there be allowed to flow into said ditch from said stream for the use and benefit aforesaid under and by virtue of said appropriation by construction, Priority No. 60, 7.8 cubic feet of [fol. 2886] water per second of time, or so much thereof as may be necessary to irrigate 100 acres of land, the appropriation of which water took effect, on and said priority dates from the 1st day of June, 1879, but said date is limited as set forth in the findings for said ditch herein.

No. 66—The John Goetz Ditch No. 2

That ditch numbered 66, named the John Goetz Ditch No. 2, E. M. Hohnholz claimant, is a ditch constructed and used for the irrigation of 200 acres of land; it draws its supply of water from Shell Creek with its headgate upon the left bank of said stream at a point whence the west quarter corner of Section 25, Township 12, North Range 76 West of the 6th P. M., bears south 75 degrees, fifteen minutes west 440 feet, and entitled by appropriation to use of water from said stream to Priority No. 83, by construction thereof and thereby to the quantity of water with the number and date of the priority of appropriation thereof, hereinafter mentioned, for the use aforesaid and for the benefit of the party or parties lawfully entitled thereto; it is hereby adjudged and decreed that there be allowed to flow into said ditch from said stream for the use and benefit aforesaid under and by virtue of said appropriation by construction, Priority No. 83, ten cubic feet of water per second of time, or so much thereof as may be necessary to irrigate two hundred acres of land, the appropriation of which water took effect on, and said priority dates from the 9th day of June, 1909.

[fol. 2887] No. 67—The Shell Creek Ditch

That ditch numbered 67, named the Shell Creek Ditch, E. M. Hohnholz claimant, is a ditch constructed and used

for the irrigation of 80 acres of land; it draws its supply of water from Shell Creek, a tributary of Sand Creek, at a point whence the west quarter corner of Section 25, Township 12, North Range 76 West of the 6th P. M., bears north 69 degrees, 52 minutes east 541 feet, and entitled by appropriation to use of water from said stream to Priority Number 84, by construction thereof and thereby to the quantity of water with the number and date of the priority of appropriation thereof, hereinafter mentioned, for the use aforesaid and for the benefit of the party or parties lawfully entitled thereto; it is hereby adjudged and decreed that there be allowed to flow into said ditch from said stream for the use and benefit aforesaid under and by virtue of said appropriation by construction, Priority No. 84, six and ninety seven hundredths cubic feet of water per second of time, or so much thereof as may be necessary to irrigate eighty acres of land, the appropriation of which water took effect on, and said priority dates from the 10th day of June, 1909.

No. 68—The Dry Creek Ditch

That ditch numbered 68, named The Dry Creek Ditch, E. M. Hohnholz, claimant, is a ditch constructed and used for the irrigation of 125 acres of land; it draws its supply of water from Dry Creek with its headgate upon the left bank of said stream at a point whence the east quarter corner of Section 25, Township 12, North Range 76 West of the 6th P. M., bears north 54 degrees east 970 feet, and entitled by appropriation to use of water from said stream [fol. 2888] to Priority Number 85, by construction thereof and thereby to the quantity of water with the number and date of the priority of appropriation thereof, hereinafter mentioned, for the use aforesaid and for the benefit of the party or parties lawfully entitled thereto; it is hereby adjudged and decreed that there be allowed to flow into said ditch from said stream for the use and benefit aforesaid under and by virtue of said appropriation by construction, Priority No. 85, ten cubic feet of water per second of time, or so much thereof as may be necessary to irrigate one hundred and twenty five acres of land, the appropriation of which water took effect on, and said priority dates from the 11th day of June, 1909.

No. 69—The Thompson Ditch

That ditch numbered 69, named The Thompson Ditch, Mrs. Nellie Thompson, claimant, is a ditch constructed and used for the irrigation of 80 acres of land; it draws its supply of water from British Creek with its headgate located at a point which bears south 57 degrees, 50 minutes west 12,100 feet from the northeast corner of Section 1, Township 10 North, Range 77 West of the 6th P. M., and entitled by appropriation to use of water from said stream to Priority No. 82, by construction thereof and thereby to the quantity of water with the number and date of the priority of appropriation thereof, hereinafter mentioned, for the use aforesaid and for the benefit of the party or parties lawfully entitled thereto; it is hereby adjudged and decreed that there be allowed to flow into said ditch from said stream for the use and benefit aforesaid under and by virtue of said appropriation by construction, Priority No. 82, five cubic feet of water per second of time, or so [fol. 2889] much thereof as may be necessary to irrigate eighty acres of land, the appropriation of which water took effect on, and said priority dates from the 26th day of May, 1909.

No. 70—The Detro Ditch No. 2

That ditch numbered 70, named The Detro Ditch No. 2, J. H. Detro, claimant, is a ditch constructed and used for the irrigation of 45 acres of land; it draws its supply of water from the Big Laramie River, with its headgate upon the east bank of said stream at a point south 77 degrees, 3 minutes east 1500 feet from the west quarter corner of Section 7, Township 11 North, Range 76 West of the 6th P. M., and entitled by appropriation to use of water from said stream to Priority No. 79, by construction thereof and thereby to the quantity of water with the number and date of the priority of appropriation thereof, hereinafter mentioned, for the use aforesaid and for the benefit of the party or parties lawfully entitled thereto; it is hereby adjudged and decreed that there be allowed to flow into said ditch from said stream for the use and benefit aforesaid under and by virtue of said appropriation by construction, Priority No. 79, eight cubic feet of water per second of time or so much thereof as may be necessary to irrigate forty-five acres of land, the appro-

priation of which water took effect on, and said priority dates from the 16th day of January, 1906.

No. 71—Stubb Creek Ditch

That ditch numbered 71, named The Stubb Creek Ditch, Thomas H. Davy, claimant, is a ditch constructed and used for the irrigation of one hundred and fifty acres of land; it [fol. 2890] draws its supply of water from Stubb Creek with its headgate upon the west bank of said stream at a point whence the northeast corner of Section 35, Township 10, North Range 76 West of the 6th P. M., bears north 80 degrees, 20 minutes east 1586 feet, and entitled by appropriation to use of water from said stream to Priority No. 88, by construction thereof and thereby to the quantity of water with the number and date of the priority of appropriation thereof, hereinafter mentioned, for the use aforesaid and for the benefit of the party or parties lawfully entitled thereto; it is hereby adjudged and decreed that there be allowed to flow into said ditch from said stream for the use and benefit aforesaid under and by virtue of said appropriation by construction, Priority No. 88, five cubic feet of water per second of time, or so much thereof as may be necessary to irrigate one hundred and fifty acres of land, the appropriation of which water took effect on, and said priority dates from the 28th day of July, 1911.

Ditch No. 72—The Rawah Ditch of the Laramie River System

That said ditch, as set forth in the findings herein, is entitled to Ditch Priority No. 71. It is claimed by The Greeley-Poudre Irrigation District, a corporation. It derives its supply of water from Rawah, West Springer, Rapid, Fall, Winifred and Mill Creeks and divers other creeks situate between Rawah Creek and the West Fork of the Laramie River, but, particularly, the upper portion or tributaries of all said streams. This ditch has its first and principal headgate on the east bank of Rawah Creek, in Larimer County, [fol. 2891] Colorado, near a point in the Northeast Quarter (NE¼) Southwest Quarter (SW¼) of Section Thirty-two (32), Township Nine (9) North, Range Seventy-six (76) West of the 6th P. M., whence the southwest corner of said Section 32 bears south 50° 50′ West 2950 feet, from which point it runs in a general easterly and southerly direction

to the north slope of the drainage area of the West Fork of the Laramie River where its waters are discharged and flow to said West Fork of the Laramie River and thence to the Laramie River Tunnel and the Cache la Poudre River. Along its course it intersects the above mentioned streams, at each of which there is a separate point of diversion identical with the intersection of said ditch with the east or south bank of each of said streams. It is intended to be used for the diversion and carriage of waters from the several creeks above mentioned to the Laramie River Tunnel and its Tunnel Reservoir and thence to the Cache la Poudre River for the irrigation of the lands of claimant. The dimensions, grade, size and carrying capacity of said ditch are as follows: Width on bottom 6 feet, depth below high water line 4 feet, slope of banks 1 to 1, grade 3 feet per thousand feet, or 15.84 feet per mile, and a carrying capacity of 225 cubic feet per second of time.

Said ditch is also intended for use as an essential part of the Laramie River System of the claimant for the carriage of waters, the flow of which has been stored and regulated by the Link Lakes Reservoirs, or delivered by the McIntyre Ditch, such use being in addition to its use as a canal for the diversion of waters from said streams as aforesaid.

The said ditch is in large measure complete, but, owing to the fact that water diverted by said canal has not been ap- [fol. 2892] plied to beneficial use for the irrigation of lands, no final decree can be awarded.

It is hereby adjudged and decreed that said ditch be given Ditch Priority No. 71, of date August 25, 1902, provided it be shown in a proper proceeding that said ditch has been fully completed and water has been diverted and thereby applied to the irrigation of lands within a reasonable time, or in the event said ditch be not further completed that water by it diverted be so applied, in which event it shall be decreed priority as from those creeks to which the same shall be finally completed, but in no case shall said ditch be awarded the right to divert more than 225 cubic feet of water per second of time from the said sources of supply, with the right to maintain the flow of water in said ditch to said capacity by conjunctive use with the Link Lakes Reservoirs and the McIntyre Ditch.

Ditch No. 73—The Rawah & Lower Supply Ditch of the Laramie River System

That said ditch, as set forth in the findings herein, is entitled to Ditch Priority No. 72. It is claimed by The Greeley-Poudre Irrigation District, a corporation. It derives its supply of water from Rawah, West Springer, Rapid, Fall, Winifred, Mill and divers other streams, tributary to the Laramie River, entering said stream on the west side thereof between Rawah Creek and the West Fork of the Laramie River. This ditch has its first or principal headgate on the east or south bank of Rawah Creek in Larimer County, Colorado, near a point in the Southwest Quarter (S. W. ¼) Southeast Quarter (S. E. ¼) of Section Fourteen (14), Township Nine (9) North, Range [fol. 2893] Seventy-six (76) West of the 6th P. M., whence the southeast corner of said section bears South 71° 0' West about 2540 feet distant, from which point it runs in a general southeasterly direction to the bed and channel of the Laramie River at a point near the west portal of the Laramie River Tunnel and in the Tunnel Reservoir, and from which said point of delivery said waters are conveyed through the Laramie River Tunnel to the Cache la Poudre River. It intersects the lines of said streams situate between Rawah Creek and the West Fork of the Laramie River and has points of diversion as to each thereof, said points being in each instance identical with the point of intersecton of sad ditch with the south or east banks of said streams. It is intended to be used for the diversion and carriage of waters from the several streams above mentioned to the Laramie River Tunnel and its Tunnel Reservoir and thence to the Cache la Poudre River for the irrigation of the lands of claimant, and, also, as an essential part of the Laramie River System of the claimant for the carriage of waters stored and regulated in the Link Lakes Reservoirs, or waters conveyed by the McIntyre Ditch and delivered at the headgate of this ditch by use of Rawah Creek.

It is not fully completed and no water has been by it diverted or applied to a beneficial use. The dimensions, grade, size and carrying capacity of said ditch vary from the point of beginning to the point of discharge and are divided into four divisions, as follows:

[fol. 2894]

Division	Material	Bottom width	Slide slopes of banks	Depth water	Grade per 1000 ft.	Length feet	Cap. cu. ft.
Rawah Creek	Loose	9 ft.	1 to 1	4 ft.	2 ft.	16000	200
	Solid	8 ft.	1-2 to 1	4 ft.	3 ft.		
Rapid Creek	Loose	10 ft.	1 to 1	4.5 ft.	1.5 ft.	2400	250
	Solid	9 ft.	1-2 to 1	4.5 ft.	3 ft.		
Fall Creek	Loose	11 ft.	1 to 1	4.5 ft.	1.5 ft.	3300	270
	Solid	10 ft.	1-2 to 1	4.5 ft.	2.7 ft.		
Mill Creek	Loose	11 ft.	1 to 1	4.6 ft.	1.5 ft.	3100	275
	Solid	10 ft.	1-2 to 1	4.6 ft.	2.7 ft.		

It is hereby adjudged and decreed that said ditch be given Ditch Priority No. 72, of date August 25, 1902, provided it be shown in a proper proceeding that it has been completed and water has been diverted and applied to the irrigation of lands within a reasonable time, but in no event shall said ditch be awarded the right to divert from said several sources of supply more than 275 cubic feet of water per second of time, with the right to maintain the flow in said ditch to said capacity by the conjunctive use of said ditch with the Link Lakes Reservoirs and the McIntyre Ditch.

Ditch No. 74. The McIntyre Ditch of the Laramie River System

That said ditch, as set forth in the findings herein, is entitled to Ditch Priority No. 73. It is claimed by The Greeley-Poudre Irrigation District, a corporation. It derives its supply of water from McIntyre Creek and some small tributaries of Rawah Creek intersected by said ditch along its lines. Its first and principal headgate is on the [fol. 2895] east bank of McIntyre Creek, in Larimer County, Colorado, at or near a point in the Northeast Quarter (NE¼) Northeast Quarter (NE¼) of Section Thirty-one (31), Township Nine (9) North, Range Seventy-six (76) West of the 6th P. M., whence the west corner of said Section 31 bears South 12°, 41′ East 4257 feet distant, from which point said ditch extends in a general southeasterly direction to Rawah Creek and at or near the headgate and place of beginning of the Rawah Ditch. It is intended to be used for the diversion and carriage of water from said McIntyre Creek and said branches of Rawah Creek, to the Cache la Poudre River by use of either the Rawah or Rawah and Lower Supply Ditches, the Tunnel Reservoir and the Laramie River Tunnel of claimant. Said ditch is not as yet complete, but is intended to be of the following dimensions, grade, size and carrying capacity; width on bottom four feet, depth below high water line 2.2 feet, slope of banks 1 to 1, grade 3 feet per thousand feet, or 15.84 feet per mile and a carrying capacity of 40 cubic feet of water per second of time. Said ditch is intended to be used not only for the diversion of water from McIntyre Creek, but also as an essential part or unit of the entire Laramie River System of the claimant, and when so used will convey the waters stored or regulated in Link Lakes

Reservoirs 10 and 11, discharging said waters for carriage as aforesaid.

It is hereby adjudged and decreed that said ditch be given Ditch Priority No. 73, of date August 25, 1902, provided it be shown in a proper proceeding that it has been completed and water diverted an applied to the irrigation [fol. 2896] of lands within a reasonable time, but in no event shall said ditch be awarded the right to divert from said sources of supply more than 40 cubic feet of water per second of time, with the right to maintain said flow at said capacity by conjunctive use with Link Lakes Reservoirs 10 and 11.

Ditch No. 75—The Deadman & Nunn Creek Ditch of the Laramie River System

That said ditch, as set forth in the findings herein, is entitled to Ditch Priority No. 74. It is claimed by The Greeley-Poudre Irrigation District, a corporation. It derives its supply of water from Deadman, Nunn, Porter, Brinker, East Springer and Half Mile Creeks and several other small streams of unknown names situate between Springer Creek and the Laramie River Tunnel. This ditch has its first and principal headgate on the south bank of Deadman Creek in the Northeast Quarter (NE¼) of Section Thirty-one (31), Township Ten (10) North, Range Seventy-five (75) West of the 6th P. M., at or near a point whence the southwest corner of said section bears South 43° 40′ 2015 feet distant, from which point it runs in a southerly direction to the Laramie River Tunnel intersecting the above mentioned streams, at which several points of intersection said ditch has additional headgates and points of diversion on the south banks of each said creeks. It is intended to be used for the diversion and carriage of water from the several creeks above mentioned to the Laramie River Tunnel and its Tunnel Reservoir and thence to the Cache la Poudre River, for the irrigation of lands of claimant. The dimensions, grade, size and carrying capacity of said ditch vary from the point of beginning to the point of discharge and are divided into three divisions, as follows:

[fol. 2897]

Division	Material	Bottom width	Slide slopes of banks	Water depth	Grade per 1000 ft.	Length feet	Cap. cu. ft.
Deadman	Loose	7 ft.	1 to 1	3.3 ft.	2.5 ft.	15000	125
	Solid	6 ft.	1-2 to 1	3.3 ft.	4.5 ft.		
Nunn	Loose	10 ft.	1 to 1	4.5 ft.	1.5 ft.	1100	250
	Solid	9 ft.	1-2 to 1	4.5 ft.	3.0 ft.		
Porter	Loose	11 ft.	1 to 1	4.5 ft.	1.6 ft.	24000	275
	Solid	10 ft.	1-2 to 1	4.5 ft.	2.7 ft.		

No water has been diverted by means of said ditch, owing to the fact that a portion of the same remains yet to be completed.

It is hereby adjudged and decreed that said ditch be given Ditch Priority No. 74, of date August 25, 1902, provided it be shown in a proper proceeding that it has been completed and water has been diverted and applied to the irrigation of lands within a reasonable time, but in no event shall said ditch be awarded the right to divert from said several sources of supply more than 275 cubic feet of water per second of time.

Ditch No. 76—The Laramie River Tunnel of the Laramie River System

That said tunnel, as set forth in the findings herein, is entitled to Ditch Priority No. 75. It is claimed by The Greeley-Poudre Irrigation District, a corporation. It derives its supply of water from the Laramie River and the West Fork of the Laramie River. Its intake or point of beginning is on the east bank of the Laramie River, near the mouth of West Fork, and in the Northeast Quarter (NE¼) Southwest Quarter (SW¼) of Section Seven (7), [fol. 2898] Township Eight (8) North, Range Seventy-five (75) West of the 6th P. M., from which point it passes through and under the Green Mountains to the Cache la Poudre River. It is intended to be used for the diversion and carriage of water from said streams to the Cache la Poudre River for the irrigation of the lands of claimant, and, also, as the principal unit or portion of the entire Laramie River System of the claimant, in conjunction with all the remaining units thereof, for the conveyance of all waters collected, regulated, diverted, conveyed and discharged at its west portal and into its Tunnel Reservoir, which said reservoir will be used for the regulation of the flow of water through said tunnel. It is 9½ feet wide by 7½ feet high in the clear and has a grade of 1.7 feet per thousand feet. Said tunnel is practically complete and ready for the carriage of water but no diversion or application of water from any of said sources has been made thereby, largely owing to litigation now pending between Wyoming and Colorado and involving the right to make such diversion.

It is hereby adjudged and decreed that said tunnel be given Ditch Priority No. 75, of date August 25, 1902, provided it be shown in a proper proceeding that it has been completed and water has been diverted and applied to the irrigation of lands within a reasonable time, but in no event shall said tunnel be awarded the right to divert from said several sources of supply more water than will flow through said tunnel as of the dimensions, grade and capacity aforesaid, when not used with its regulating basin, and, in addition thereto, it shall be given the right to maintain the flow of water to its capacity when said tunnel is used in conjunction with the remaining units of said system for the carriage of water discharged into its west portal.

[fol. 2899] No. 77—The Upper Hills Ditch

That ditch numbered 77, named The Upper Hills Ditch, The Greeley-Poudre Irrigation District, claimant, is a ditch constructed and used for the irrigation of 200 acres of land; it draws its supply of water from the Big Laramie River, with its headgate located on the east bank of the Laramie River, at a point whence the south quarter corner of Section 34, Township 11 North, Range 76 West of the 6th P. M., bears south 73 degrees, 18 minutes east 2,345 feet, and entitled by appropriation to use of water from said stream to Priority No. 62, by construction thereof and thereby to the quantity of water with the number and date of the priority of appropriation thereof, hereinafter mentioned, for the use aforesaid, and for the benefit of the party or parties lawfully entitled thereto;

It is hereby adjudged and decreed that there be allowed to flow into said ditch from said stream for the use and benefit aforesaid under and by virtue of said appropriation by construction, Priority No. 62, 10 cubic feet of water per second of time, or so much thereof as may be necessary to irrigate 200 acres of land, the appropriation of which water took effect on, and said priority dates from the 1st day of May, 1887, but said date is limited as set forth in the findings for said ditch herein, and in paragraph 8 of this decree.

No. 78—Second Enlargement and Extension of Martin Ditch No. 2

That ditch numbered 78, named The Second Enlargement and Extension of Martin Ditch No. 2, The Greeley-Poudre

Irrigation District, claimant, is a ditch constructed and used for the irrigation of eighty acres of land; it draws its supply [fol. 2900] of water from the Laramie River with its headgate upon the west bank of said stream at a point whence the north quarter corner of Section 10, Township 10, North Range 76 West of the 6th P. M., bears North 4 degrees, 35 minutes west 1,920 feet, and entitled by appropriation to use of water from said stream to Priority No. 86, by construction thereof and thereby to the quantity of water with the number and date of the priority of appropriation thereof, hereinafter mentioned, for the use aforesaid and for the benefit of the party or parties lawfully entitled thereto; it is hereby adjudged and decreed that there be allowed to flow into said ditch from said stream for the use and benefit aforesaid under and by virtue of said appropriation by construction, Priority No. 86, six cubic feet of water per second of time, or so much thereof as may be necessary to irrigate eighty acres of land, the appropriation of which water took effect on, and said priority dates from the 25th day of May, 1910.

No. 79—Enlargement of the Mansfield Ditch

That ditch numbered 79, named The Enlargement of the Mansfield Ditch, The Greeley-Poudre Irrigation District, claimant, is a ditch constructed and used for the irrigation of seventy-five acres of land; it draws its supply of water from the Big Laramie River, with its headgate identical with the headgate of the Mansfield Ditch as shown in the former decree of this Court, and entitled by appropriation to use of water from said stream to Priority No. 68, by construction thereof and thereby to the quantity of water with the number and date of the priority of appropriation thereof, hereinafter mentioned, for the use aforesaid and for the benefit of the party or parties lawfully entitled thereto; it is hereby adjudged and decreed that there be allowed to flow [fol. 2901] into said ditch from said stream for the use and benefit aforesaid under and by virtue of said appropriation by enlargement, Priority No. 68, for 4 feet additional, making a total of 15.61 cubic feet of water per second of time, or so much thereof as may be necessary to irrigate seventy-five acres of land, the appropriation of which water took effect on, and said priority dates from the 1st day of April, 1902, but said date is limited as set forth in the findings for said ditch herein, and in paragraph 8 of this decree.

No. 80—The Enlargement of Mansfield Ditch No. 2

That ditch numbered 80, named The Enlargement of Mansfield Ditch No. 2, the Greeley-Poudre Irrigation District, claimant, is a ditch constructed and used for the irrigation of one hundred and fifty acres of land; it draws its supply of water from the Big Laramie River, with its headgate located at the identical point of the location of the headgate of the Mansfield Ditch No. 2, as heretofore fixed by decree of this Court, and entitled by appropriation to use of water from said stream to Priority No. 69, by construction thereof and thereby to the quantity of water with the number and date of the priority of appropriation thereof, hereinafter mentioned, for the use aforesaid and for the benefit of the party or parties lawfully entitled thereto; it is hereby adjudged and decreed that there be allowed to flow into said ditch from said stream for the use and benefit aforesaid under and by virtue of said appropriation by enlargement, Priority No. 69, for 1.9 cubic feet of water addi-
[fol. 2902] tional, with a total of 21.74 cubic feet of water per second time, or so much thereof as may be necessary to irrigate one hundred and fifty acres of land, the appropriation of which water took effect on, and said Priority dates from the 15th day of April, 1902, but said date is limited as set forth in the findings for said ditch herein, and in paragraph 8 of this decree.

Ditch No. 81—The Mansfield Ditch No. 3

That said ditch set forth in the findings herein is entitled to ditch Priority No. 78. It is claimed by The Greeley-Poudre Irrigation District, a corporation, and derives its supply of water from the Laramie River, the headgate thereof being situate on the west bank of said stream, at a point bearing south 74 degree, 45 minutes east 1365, from the east quarter corner of Section Two (2), Township Eleven (11) North, Range Seventy-seven (77) West of the 6th P. M., from which point it runs in a northwesterly direction about one and one-half miles. It will be used for the diversion and carriage of water from said river for the irrigation of about 75 acres of land situate on the Upper Boswell Ranch, and lying immediately above those lands already irrigated by Mansfield Ditch No. 2. Said ditch is being constructed of the following dimensions: Six feet wide on the bottom, eight

feet wide on top, water depth two feet, a grade of 5.28 feet per mile, and has a carrying capacity of 29.4 cubic feet of water per second of time. No water has been diverted by means of said ditch or applied to the irrigation of the lands on account of the fact that the lower portion thereof has not yet been completed.

[fol. 2903] It is hereby adjudged and decreed that said ditch be given Ditch Priority No. 78, provided it be shown in the proper proceeding that it has been completed and water has been diverted and applied to the irrigation of lands, within a reasonable time. But in no event shall said ditch be awarded the right to divert from said stream more than 29.4 cubic feet of water per second of time for the irrigation of not to exceed 75 acres of land.

No. 82—The Stuart Ditch

That ditch numbered 82, named the Stuart Ditch, The Greeley-Poudre Irrigation District, claimant, is a ditch constructed and used for the irrigation of about 25 acres of land; it draws its supply of water from Stuart Creek, with its headgate located on the north bank of said Creek, at a point whence the southwest corner of Section 5, Township 10, North, Range 76 West of the 6th P. M., bears south 10 degrees, east 4045 feet, and entitled by appropriation to use of water from said stream to Priority No. 63 by construction thereof and thereby to the quantity of water with the number and date of the priority of appropriation thereof, hereinafter mentioned, for the use aforesaid, and for the benefit of the party or parties lawfully entitled thereto;

It is hereby adjudged and decreed that there be allowed to flow into said ditch from said stream for the use and benefit aforesaid under and by virtue of said appropriation by construction, Priority No. 63, 7.2 cubic feet of water per second of time, or so much thereof as may be necessary to irrigate 25 acres of land, the appropriation of which water took effect, on and said priority dates from the 15th day of April, 1896, but said date is limited as set forth in the find-
[fol. 2904] ings for said ditch herein, and in paragraph 8 of this decree.

Ditch No. 83—The Stuart Ditch No. 2

That said ditch set forth in the findings herein is entitled to Ditch Priority No. 89, which is claimed by The Greeley-Poudre Irrigation District, a corporation. It derives its supply of water from McIntyre Creek, the headgate thereof being on the east bank of said Creek, at a point whence the north quarter section corner of Section Five (5), Township Ten (10) North, Range Seventy-six (76) west bears north 24 degrees 50 minutes west 7770 feet distant, from which point said ditch runs in a northerly direction for about two miles.

It is being constructed six feet wide on the bottom, eight feet wide on top, capable of carrying water two feet in depth, with a grade of 5.28 feet per mile, and a carrying capacity of 29.4 cubic feet of water per second of time, and can be used for the irrigation of about 60 acres of land belonging to claimant, and lying on the east side of McIntyre Creek and on the west slope of Middle Mountain. No water has been diverted by means of said ditch owing to the fact that it is not yet complete.

It is hereby adjudged and decreed that said ditch be given Ditch Priority No. 89, of date May 24th, 1913, provided it be shown in a proper proceeding that it has been completed and water has been diverted and applied to the irrigation of lands within a reasonable time, but in no event shall said ditch be awarded the right to divert from McIntyre Creek more than 29.4 cubic feet of water per second of time for the irrigation of not to exceed 60 acres of land, situate as aforesaid.

[fol. 2905] No. 84—Enlargement of Link Ditch No. 2

That ditch numbered 84, named The Enlargement of Link Ditch No. 2, The Greeley-Poudre Irrigation District, claimant, is a ditch constructed and used for the irrigation of 50 acres of land; it draws its supply of water from Link Creek, with its headgate located at a point identical with the headgate of the Link Ditch No. 2, as heretofore fixed by decree of this Court in Priority No. 32, of date the 10th day of June, 1896, and entitled by appropriation to use of water from said stream to Priority No. 66, by enlargement thereof and thereby to the quantity of water with the number and date of the priority of appropriation thereof, hereinafter

mentioned, for the use aforesaid, and for the benefit of the party or parties lawfully entitled thereto;

It is hereby adjudged and decreed that there be allowed to flow into said ditch from said stream for the use and benefit aforesaid under and by virtue of said appropriation by construction, Priority No. 66, by enlargement, for 3.4 cubic feet of water per second of time, or so much thereof as may be necessary to irrigate 50 acres of land, the appropriation of which water took effect on, and said priority dates from the 15th day of June, 1896, but said date is limited as set forth in the findings for said ditch herein, and in paragraph 8 of this decree.

[fol. 2906] Reservoir Decree

[fol. 2907] No. 3—Wears Ditch and Reservoir

That reservoir numbered 3, named the Wears Ditch and Reservoir, James A. Wears, claimant, is a reservoir constructed to irrigate about 160 acres of land; it is located on parts of Sections 34 and 35, Township 11 North, Range 76 West of the 6th P. M. It takes its supply of water from Jim Creek, a tributary of the Big Laramie River, through the inlet ditch, and is entitled to one appropriation for the purpose of filling said reservoir from the said stream to Priority No. 19, by construction thereof, and thereby entitled to the quantity of water with the number and date of priority of appropriation thereof hereinafter mentioned, for the use aforesaid, and for the benefit of the party or parties lawfully entitled thereto.

It is hereby adjudged and decreed that the said reservoir be allowed to have stored in it from Jim Creek, by means of the ditch aforesaid, and for the benefit of the party or parties aforesaid, under and by virtue of the said appropriation by construction Priority No. 19, so much water as is necessary to fill said reservoir to a depth of 7 feet and 6 inches above the bottom of the outlet tube with a capacity of 2,947,628 cubic feet of water, which appropriation of water for storage purposes took effect on and dates from the 15th day of October, 1908.

No. 4—Johnson Reservoir

That reservoir numbered 4, named the Johnson Reservoir, Everett D. Bullard, claimant, is a reservoir construct-

ed to irrigate about 100 acres of land; it is located on parts of Sections 2, 3, 10 and 11, in Township 11 North, Range 77 West of the 6th P. M., with an area at its upper contour of about 52 acres. It takes its supply of water from Grace [fol. 2908] Creek, a tributary of the Big Laramie River, through the Grace Creek Ditch, and is entitled to one appropriation for the purpose of filling said reservoir from the said stream, to Priority No. 3, by construction thereof, and thereby entitled to the quantity of water with the number and date of priority of appropriation thereof hereinafter mentioned, for the use aforesaid and for the benefit of the party or parties lawfully entitled thereto.

It is hereby adjudged and decreed that the said reservoir be allowed to have stored in it from Grace Creek, by means of the ditch aforesaid, and for the benefit of the party or parties aforesaid, under and by virtue of the said appropriation by construction, Priority No. 3, so much water as is necessary to fill said reservoir to a depth of 3 feet above the bottom of the outlet tube with a capacity of 6,500,000 cubic feet of water, which appropriation of water for storage purposes took effect on and dates from the 1st day of June, 1897.

Reservoir No. 5—Link Lake Reservoir No. 1 of the Laramie River System

That said reservoir, as set forth in the findings herein, is entitled to Reservoir Priority No. 4. It is claimed by The Greeley-Poudre Irrigation District, a corporation. It is located in Larimer County, Colorado, upon the SE¼ of Section Seven (7), Township Eight (8) North, Range 76 West of the 6th P. M. It will be constructed across a branch of Rawah Creek and has no inlet ditch, said creek serving to convey water to said reservoir. Rawah Creek is used to convey waters from its outlet to the Laramie River Tunnel, by way of The Rawah Ditch or The Rawah & Lower Supply Ditch of claimant. It derives its supply [fol. 2909] of water from said branch of Rawah Creek, being that portion of said stream lying between the crest of the Medicine Bow range of mountains and said reservoir. This reservoir is intended to be used for the storage of water for irrigation, and, also, as an essential part of the Laramie River System of the claimant for regulating the flow of water through said system and to the Cache la

Poudre River. The said reservoir is not as yet constructed, but it is intended to be constructed as follows: Area at high water line 30 acres, depth of water to be stored 35 feet and estimated storage and regulating capacity 45,738,000 cubic feet.

It is hereby adjudged and decreed that said reservoir be given Reservoir Priority No. 4, of date August 25, 1902, provided it be shown in a proper proceeding that said reservoir has been completed and water has been diverted and applied thereby to the irrigation of lands within a reasonable time, but in no case shall the amount decreed said reservoir exceed a storage depth of 35 feet above the bottom of the outlet tube and a capacity of 45,738,000 cubic feet.

Reservoir No. 6—Link Lake Reservoir No. 2 of the Laramie River System

That said reservoir, as set forth in the findings herein, is entitled to Reservoir Priority No. 5. It is claimed by The Greeley-Poudre Irrigation District, a corporation. It is located in Larimer County, Colorado, upon the SW¼ of Section 5, Township 8 North, Range 76 West of the 6th P. M. It will be constructed across a branch of Rawah Creek and has no inlet ditch, said creek serving to convey water to said reservoir. Rawah Creek is used to convey waters from its outlet to the Laramie River Tunnel, by way of The Rawah Ditch or The Rawah & Lower Supply Ditch of claimant. It derives its supply of water from said [fol. 2910] branch of Rawah Creek, being that portion of said stream lying between the crest of the Medicine Bow range of mountains and said reservoir. This reservoir is intended to be used for the storage of water for irrigation, and, also, as an essential part of the Laramie River System of the claimant for regulating the flow of water through said system and to the Cache la Poudre River. The said reservoir is not as yet constructed, but it is intended to be constructed as follows: Area at high water line 50 acres, depth of water to be stored 30 feet, and estimated storage and regulating capacity 60,984,000 cubic feet.

It is hereby adjudged and decreed that said reservoir be given Reservoir Priority No. 5, of date August 25, 1902, provided it be shown in a proper proceeding that said reservoir has been completed and water has been diverted

and applied thereby to the irrigation of lands within a reasonable time, but in no case shall the amount decreed said reservoir exceed a storage depth of 30 feet above the bottom of the outlet tube and a capacity of 60,984,000 cubic feet.

Reservoir No. 7—Link Lake Reservoir No. 3 of the Laramie River System

That said reservoir, as set forth in the findings herein, is entitled to Reservoir Priority No. 6. It is claimed by The Greeley-Poudre Irrigation District, a corporation. It is located in Larimer County, Colorado, upon the NW¼ of Section 5, Township 8 North, Range 7 6West of the 6th P. M. It will be constructed across a branch of Rawah Creek and has no inlet ditch, said creek serving to convey water to said reservoir. Rawah Creek is used to convey waters from its outlet to the Laramie River Tunnel, by way of The Rawah Ditch or The Rawah & Lower Supply Ditch of claimant. It derives its supply of water from said branch of Rawah Creek, being that portion of said [fol. 2911] stream lying between the crest of the Medicine Bow range of mountains and said reservoir. This reservoir is intended to be used for the storage of water for irrigation, and, also, as an essential part of the Laramie River System of the claimant for regulating the flow of water through said system and to the Cache la Poudre River. The said reservoir is not as yet constructed, but it is intended to be constructed as follows: Area at high water line 16 acres, depth of water to be stored 30 feet and estimated storage and regulating capacity 22,869,000 cubic feet.

It is hereby adjudged and decreed that said reservoir be given Reservoir Priority No. 6, of date August 25, 1902, provided it be shown in a proper proceeding that said reservoir has been completed and water has been diverted and applied thereby to the irrigation of lands within a reasonable time, but in no case shall the amount decreed said reservoir exceed a storage depth of 30 feet above the bottom of the outlet tube and a capacity of 22,869,000 cubic feet.

Reservoir No. 8. Link Lake Reservoir No. 4 of the Laramie River System

That said reservoir, as set forth in the findings herein, is entitled to Reservoir Priority No. 7. It is claimed by

The Greeley-Poudre Irrigation District, a corporation. It is located in Larimer County, Colorado, upon the NW¼ of Section 5, Township 8 North, Range 76 West and the SW¼ of Section 32, Township 9 North, Range 76 West of the 6th P. M. It will be constructed across Rawah Creek and has no inlet ditch, said creek serving to convey water to said reservoir. Rawah Creek is used to convey waters from its outlet to the Laramie River Tunnel, by way of The Rawah Ditch and The Rawah & Lower Supply Ditch of claimant. It derives its supply of water from Rawah Creek, being that portion of said stream lying between the crest [fol. 2912] of the Medicine Bow range of mountains and said reservoir. This reservoir is intended to be used for the storage of water for irrigation, and, also, as an essential part of the Laramie River System of the claimant for regulating the flow of water through said system and to the Cache la Poudre River. The said reservoir is not as yet constructed, but it is intended to be constructed as follows: Area at high water line 20 acres, depth of water to be stored 25 feet and estimated storage and regulating capacity 25,780,000 cubic feet.

It is hereby adjudged and decreed that said reservoir be given Reservoir Priority No. 7, of date August 25, 1902, provided it be shown in a proper proceeding that said reservoir has been completed and water has been diverted and applied thereby to the irrigation of lands within a reasonable time, but in no case shall the amount decreed said reservoir exceed a storage depth of 25 feet above the bottom of the outlet tube and a capacity of 25,780,000 cubic feet.

Reservoir No. 9. Link Lake Reservoir No. 5 of the Laramie River System

That said reservoir, as set forth in the findings herein, is entitled to Reservoir Priority No. 8. It is claimed by The Greeley-Poudre Irrigation District, a corporation. It is located in Larimer County, Colorado, upon the N½ of Section 5, Township 8 North, Range 76 West of the 6th P. M. It will be constructed across a branch of Rawah Creek and has no inlet ditch, said creek serving to convey water to said reservoir. Rawah Creek is used to convey waters from its outlet to the Laramie River Tunnel, by way of The Rawah Ditch or The Rawah & Lower Supply

Ditch of claimant. It derives its supply of water from said branch of Rawah Creek, being that portion of said stream [fol. 2913] lying between the crest of the Medicine Bow range of mountains and said reservoir. This reservoir is intended to be used for the storage of water for irrigation, and, also, as an essential part of the Laramie River System of the claimant for regulating the flow of water through said system and to the Cache la Poudre River. The said reservoir is not as yet constructed, but it is intended to be constructed as follows: Area at high water line 20 acres, depth of water to be stored 35 feet and estimated storage and regulating capacity 30,492,000 cubic feet.

It is hereby adjudged and decreed that said reservoir be given Reservoir Priority No. 8, of date August 25, 1902, provided it be shown in a proper proceeding that said reservoir has been completed and water has been diverted and applied thereby to the irrigation of lands within a reasonable time, but in no case shall the amount decreed said reservoir exceed a storage depth of 35 feet above the bottom of the outlet tube and a capacity of 30,492,000 cubic feet.

Reservoir No. 10—Link Lake Reservoir No. 6 of the Laramie River System

That said reservoir, as set forth in the findings herein, is entitled to Reservoir Priority No. 9. It is claimed by The Greeley-Poudre Irrigation District, a corporation. It is located in Larimer County, Colorado, upon the N½ of Section 5, Township 8 North, Range 76 West and the SW¼ of Section 32, Township 9 North, Range 76 West of the 6th P. M. It will be constructed across a branch of Rawah Creek and has no inlet ditch, said creek serving to convey water to said reservoir. Rawah Creek is used to convey waters from its outlet to the Laramie River Tunnel, by way of The Rawah Ditch or The Rawah & Lower Supply Ditch of claimant. It derives its supply of water from said branch of Rawah Creek, being that portion of said stream [fol. 2914] lying between the crest of the Medicine Bow range of mountains and said reservoir. This reservoir is intended to be used for the storage of water for irrigation, and, also, as an essential part of the Laramie River System of the claimant for regulating the flow of water through said system and to the Cache la Poudre River.

The said reservoir is not as yet constructed, but it is intended to be constructed as follows: Area at high water line 12 acres, depth of water to be stored 25 feet and estimated storage and regulating capacity 13,068,000 cubic feet.

It is hereby adjudged and decreed that said reservoir be given Reservoir Priority No. 9, of date August 25, 1902, provided it be shown in a proper proceeding that said reservoir has been completed and water has been diverted and applied thereby to the irrigation of lands within a reasonable time, but in no case shall the amount decreed said reservoir exceed a storage depth of 25 feet above the bottom of the outlet tube and a capacity of 13,068,000 cubic feet.

Reservoir No. 11—Link Lakes Reservoir No. 7 of the Laramie River System

That said reservoir, as set forth in the findings herein, is entitled to Reservoir Priority No. 10. It is claimed by The Greeley-Poudre Irrigation District, a corporation. It is located in Larimer County, Colorado, upon the NE¼ of Section 5, Township 8 North, Range 76 West of the 6th P. M. It will be constructed across a branch of Rawah Creek and has no inlet ditch, said creek serving to convey water to said reservoir. Rawah Creek is used to convey waters from its outlet to the Laramie River Tunnel, by way of The Rawah Ditch or The Rawah & Lower Supply Ditch of claimant. It derives its supply of water from said branch of Rawah Creek, being that portion of said stream lying between the crest of the Medicine Bow range of moun-[fol. 2915] tains and said reservoir. This reservoir is intended to be used for the storage of water for irrigation, and, also, as an essential part of the Laramie River System of the claimant for regulating the flow of water through said system and to the Cache la Poudre River. The said reservoir is not as yet constructed, but it is intended to be constructed as follows: Area at high water line 11 acres, depth of water to be stored 40 feet and estimated storage and regulating capacity 19,166,000 cubic feet.

It is hereby adjudged and decreed that said reservoir be given Reservoir Priority No. 10, of date August 25, 1902, provided it be shown in a proper proceeding that said reservoir has been completed and water has been diverted and applied thereby to the irrigation of lands within a rea-

sonable time, but in no case shall the amount decreed said reservoir exceed a storage depth of 40 feet above the bottom of the outlet tube and a capacity of 19,166,000 cubic feet.

Reservoir No. 12.—Link Lake Reservoir No. 8 of the Laramie River System

That said reservoir, as set forth in the findings herein, is entitled to Reservoir Priority No. 11. It is claimed by The Greeley-Poudre Irrigation District, a corporation. It is located in Larimer County, Colorado, upon a the S½ of Section 4, Township 8 North, Range 76 West of the 6th P. M. It will be constructed across a branch of Rawah Creek and has no inlet ditch, said creek serving to convey water to said reservoir. Rawah Creek is used to convey waters from its outlet to the Laramie River Tunnel, by way of The Rawah Ditch or The Rawah & Lower Supply [fol. 2916] Ditch of claimant. It derives its supply of water from said branch of Rawah Creek, being that portion of said stream lying between the crest of the Medicine Bow range of mountains and said reservoir. This reservoir is intended to be used for the storage of water for irrigation, and, also, as an essential part of the Laramie River System of the claimant for regulating the flow of water through said system and to the Cache la Poudre River. The said reservoir is not as yet constructed, but it is intended to be constructed as follows: Area at high water line 50 acres, depth of water to be stored 40 feet and estimated storage and regulating capacity 87,120,000 cubic feet.

It is hereby adjudged and decreed that said reservoir be given Reservoir Priority No. 11, of date August 25, 1902, provided it be shown in a proper proceeding that said reservoir has been completed and water has been diverted and applied thereby to the irrigation of lands within a reasonable time, but in no case shall the amount decreed said reservoir exceed a storage depth of 40 feet above the bottom of the outlet tube and a capacity of 87,120,000 cubic feet.

Reservoir No. 13.—Link Lake Reservoir No. 9 of the Laramie River System

That said reservoir, as set forth in the findings herein, is entitled to Reservoir Priority No. 12. It is claimed by

The Greeley-Poudre Irrigation District, a corporation. It is located in Larimer County, Colorado, upon the NE¼ of Section 6, Township 8 North, Range 76 West of the 6th P. M. It will be constructed across a branch of Rawah Creek and has no inlet ditch, said creek serving to convey [fol. 2917] water to said reservoir. Rawah Creek is used to convey waters from its outlet to the Laramie River Tunnel, by way of The Rawah Ditch or The Rawah & Lower Supply Ditch of claimant. It derives its supply of water from said branch of Rawah Creek, being that portion of said stream lying between the crest of the Medicine Bow range of mountains and said reservoir. This reservoir is intended to be used for the storage of water for irrigation, and, also, as an essential part of the Laramie River System and to the Cache la Poudre River. The said reservoir is not as yet constructed, but it is intended to be constructed as follows: Area at high water line 25 acres, depth of water to be stored 40 feet and estimated storage and regulating capacity 25,000,000 cubic feet.

It is hereby adjudged and decreed that said reservoir be given Reservoir Priority No. 12, of date August 25, 1902, provided it be shown in a proper proceeding that said reservoir has been completed and water has been diverted and applied thereby to the irrigation of lands within a reasonable time, but in no case shall the amount decreed said reservoir exceed a storage depth of 40 feet above the bottom of the outlet tube and a capacity of 25,000,000 cubic feet.

Reservoir No. 14.—Link Lakes Reservoir No. 10 of the Laramie River System

That said reservoir, as set forth in the findings herein, is entitled to Reservoir Priority No. 13. It is claimed by The Greeley-Poudre Irrigation District, a corporation. It is located in Larimer County, Colorado, upon the NE¼ of Section 31, Township 9 North, Range 76 West of the 6th P. M. It will be constructed across McIntyre Creek and has no inlet ditch, said creeks serving to convey water [fol. 2918] to said reservoir. McIntyre and Rawah Creeks are used to convey waters from its outlet to the Laramie River Tunnel, by way of the McIntyre Ditch and the Rawah Ditch or The Rawah & Lower Supply Ditch of claimant. It derives its supply of water from said McIntyre Creek, be-

ing that portion of said stream lying between the crest of the Medicine Bow range of mountains and said reservoir. This reservoir is intended to be used for the storage of water for irrigation, and, also, as an essential part of the Laramie River System of the claimant for regulating the flow of water through said system and the Cache la Poudre River. The said reservoir is not as yet constructed, but it is intended to be constructed as follows: Area at high water line 14 acres, depth of water to be stored 30 feet and estimated storage and regulating capacity 18,500,000 cubic feet.

It is hereby adjudged and decreed that said reservoir be given Reservoir Priority No. 13, of date August 25, 1902, provided it be shown in a proper proceeding that said reservoir has been completed and water has been diverted and applied thereby to the irrigation of lands within a reasonable time, but in no case shall the amount decreed said reservoir exceed a storage depth of 30 feet above the bottom of the outlet tube and a capacity of 18,500,000 cubic feet.

Reservoir No. 15.—Link Lake Reservoir No. 11 of the Laramie River System

That said reservoir, as set forth in the findings herein, is entitled to Reservoir Priority No. 14. It is claimed by The Greeley-Poudre Irrigation District, a corporation. It is located in Larimer County, Colorado, upon the SW¼ of Section 31, Township 9 North, Range 76 West of the 6th P. M. It will be constructed across McIntyre Creek and has [fol. 2919] no inlet ditch, said creeks serving to convey water to said reservoir. McIntyre and Rawah Creeks are used to convey waters from its outlet to the Laramie River Tunnel, by way of the McIntyre Ditch and the Rawah Ditch or the Rawah and Lower Supply Ditch of claimant. It derives its supply of water from said McIntyre Creek, being that portion of said stream lying between the crest of the Medicine Bow range of mountains and said reservoir. This reservoir is intended to be used for the storage of water for irrigation, and, also, as an essential part of the Laramie River System of the claimant for regulating the flow of water through said system and to the Cache la Poudre River. The said reservoir is not as yet constructed, but it is intended to be constructed as follows: Area at high

water line 35 acres, depth of water to be stored 35 feet and estimated storage and regulating capacity 50,000,000 cubic feet.

It is hereby adjudged and decreed that said reservoir be given Reservoir Priority No. 14, of date August 25, 1902, provided it be shown in a proper proceeding that said reservoir has been completed and water has been diverted and applied thereby to the irrigation of lands within a reasonable time, but in no case shall the amount decreed said reservoir exceed a storage depth of 35 feet and estimated storage and regulating capacity of 50,000,000 cubic feet.

Reservoir No. 16—Link Lake Reservoir No. 12. of the Laramie River System

That said reservoir, as set forth in the findings herein, is entitled to Reservoir Priority No. 15. It is claimed by The Greeley-Poudre Irrigation District, a corporation. It is located in Larimer County, Colorado, upon the NW¼ of Section 4, Township 8 North, Range 76 West of the 6th P. M. It will be constructed across a branch of Rawah Creek and [fol. 2920] has no inlet ditch, said creek serving to convey water to said reservoir. Rawah Creek is used to convey waters from its outlet to the Laramie River Tunnel, by way of The Rawah & Lower Supply Ditch of claimant. It derives its supply of water from said branch of Rawah Creek, being that portion of said stream lying between the crest of the Medicine Bow range of mountains and said reservoir. This reservoir is intended to be used for the storage of water for irrigation, and, also as an essential part of the Laramie River System of the claimant for regulating the flow of water through said system and to the Cache la Poudre River. The said reservoir is not as yet constructed, but it is intended to be constructed as follows: Area at high water line 14 acres, depth of water to be stored 10 feet, and estimated storage and regulating capacity 6,000,000 cubic feet.

It is hereby adjudged and decreed that said reservoir be given Reservoir Priority No. 15, of date August 25, 1902, provided it be shown in a proper proceeding that said reservoir has been completed and water has been diverted and applied thereby to the irrigation of lands within a reasonable time, but in no case shall the amount decreed said reservoir exceed a storage depth of 10 feet above the bottom of the outlet tube and a capacity of 6,000,000 cubic feet.

Reservoir No. 17—Link Lake Reservoir No. 13 of the Laramie River System

That said reservoir, as set forth in the findings herein, is entitled to Reservoir Priority No. 16. It is claimed by The [fol. 2921] Greeley-Poudre Irrigation District, a corporation. It is located in Larimer County, Colorado, upon the NE¼ of Section 29, Township 9 North, Range 76 West of the 6th P. M. It will be constructed across a branch of Rawah Creek and has no inlet ditch, said creek serving to convey water to said reservoir. Rawah Creek is used to convey waters from its outlet to the Laramie River Tunnel, by way of The Rawah & Lower Supply Ditch of claimant. It derives its supply of water from said branch of Rawah Creek, being that portion of said stream lying between the crest of the Medicine Bow range of mountains and said reservoir. This reservoir is intended to be used for the storage of water for irrigation, and, also, as an essential part of the Laramie River System of the claimant for regulating the flow of water through said system and to the Cache la Poudre River. The said reservoir is not as yet constructed, but it is intended to be constructed as follows: Area at high water line 60 acres, depth of water to be stored 10 feet and estimated storage and regulating capacity 26,000,000 cubic feet.

It is hereby adjudged and decreed that said reservoir be given Reservoir Priority No. 16, of date August 25, 1902, provided it be shown in a proper proceeding that said reservoir has been completed and water has been diverted and applied thereby to the irrigation of lands within a reasonable time, but in no case shall the amount decreed said reservoir exceed a storage depth of 10 feet above the bottom of the outlet tube and a capacity of 26,000,000 cubic feet.

[fol. 2922] Reservoir No. 18—Link Lake Reservoir No. 14 of the Laramie River System

That said reservoir, as set forth in the findings herein, is entitled to Reservoir Priority No. 17. It is claimed by the Greeley-Poudre Irrigation District, a corporation. It is located in Larimer County, Colorado, upon the NE¼ of Section 29, Township 9 North, Range 76 West of the 6th P. M. It will be constructed across Spring Creek, a branch and tributary of Rawah Creek and has no inlet ditch, said creek serving to convey water to said reservoir. Rawah Creek

is used to convey waters from its oulet to the Laramie River Tunnel, by way of The Rawah & Lower Supply Ditch of claimant. It derives its supply of water from said Spring Creek, being that portion of said stream lying between the head waters thereof and said reservoir. This reservoir is intended to be used for the storage of water for irrigation, and, also, as an essential part of the Laramie River System of the claimant for regulating the flow of water through said system and to the Cache la Poudre River. The said reservoir is not as yet constructed, but it is intended to be constructed as follows: Area at high water line 50 acres, depth of water to be stored 12 feet and estimated storage and regulating capacity 26,000,000 cubic feet.

It is hereby adjudged and decreed that said reservoir be given Reservoir Priority No. 17, of date August 25, 1902, provided it be shown in a proper proceeding that said reservoir has been completed and water has been diverted and applied thereby to the irrigation of lands within a reasonable time, but in no case shall the amount decreed said reservoir exceed a storage depth of 12 feet above the bottom of the outlet tube and a capacity of 26,000,000 cubic feet.

[fol. 2923] No. 19—The Tunnel Reservoir of the Laramie River System

That said reservoir, as set forth in the findings herein, is entitled to no special priority, but shall for all purposes be considered in the nature of a regulation or expansion basin for the better regulation and discharge of the flow of the waters of the Laramie River System of The Greeley-Poudre Irrigation District into the Laramie River Tunnel. It is located in Larimer County, Colorado, upon portions of Sections Six (6) and Seven (7), Township Eight (8) North, Range Seventy-five (75) West of the 6th P. M. and Section One (1), Township Eight (8) North, Range Seventy-six (76) West of the 6th P. M. It is in process of construction across the valley of the Laramie River, its dam being located immediately below the mouth of the West Fork of said stream. The Rawah Ditch, The Lower Rawah and Supply Ditch and The Deadman and Nunn Creek Ditch are each and all used for the conveyances of water from the various portions of the system of the claimant, The Greeley-Poudre Irrigation District, to said Tunnel Reservoir for regulation, accumulation and discharge into and through

the Laramie River Tunnel. It also intercepts and diverts water of both the Laramie River and West Fork without the aid of either of the ditches aforesaid. Said reservoir is not yet complete, but when constructed as planned, will cover about 217 acres at high water line and will be capable of regulating the flow of water to it delivered and by it intercepted and diverted to a depth of 33 feet and will have an estimated regulating capacity of 170,000,000 cubic feet.

Said reservoir will not be awarded separate decree as a storage reservoir, but it is hereby adjudged and decreed that it shall at all times be considered as a part and unit of the Laramie River System of the claimant for the uses [fol. 2924] and purposes aforesaid without special priority number, but of the same date as the remainder of said system, provided, however, the said reservoir be completed within reasonable time and water thereafter diverted and regulated and therefrom discharged by means of the Laramie River Tunnel into the Cache la Poudre River and thereafter applied for the irrigation of lands.

Reservoir No. 20—The Laramie River Reservoir

That said reservoir, as set forth in the findings herein, is entitled to Reservoir Priority No. 18. It is claimed by The Greeley-Poudre Irrigation District, a corporation. It is located in Larimer County, Colorado, upon portions of Sections one (1), Two (2), Three (3), Eleven (11), Twelve (12) and Fourteen (14), Township Nine (9) North, Range Seventy-six (76) West, and Section Thirty-five (35), Township Ten (10) North, Range Seventy-six (76) West of the 6th P. M. It will be constructed across the Laramie River and has no inlet ditch, said river and its tributaries serving to convey water to said reservoir, from which stream and tributaries its water supply is derived. It is intended to be used for the storage of water for irrigation and, also as a basin for the regulation of the flow of the water of the Laramie River in such a manner as to permit the greatest beneficial use thereof to all appropriators diverting water from said river below the said reservoir. It is not as yet completed, but, when constructed, is intended to be as follows: Area at high water line about 1200 acres, storage depth 80 feet and storage capacity 1,940,000,000 cubic feet. [fol. 2925] It is hereby adjudged and decreed that said reservoir be given Reservoir Priority Numbered 18, of date

April 6, 1908, provided it be shown in a proper proceeding that said reservoir has been completed and water has been diverted, stored and applied to a beneficial use thereby within a reasonable time, but in no case shall the amount decreed said reservoir exceed a storage depth of 80 feet above the bottom of the outlet tube and a capacity of 1,940,000,000 cubic feet.

And it is further ordered, adjudged and decreed that each and every of the appropriations of water herein found and adjudged to have been made from the waters of the said Big Laramie River and of its several tributaries, herein named, and given priority numbers according to their several dates of appropriation by construction or enlargement as set forth in this decree, are to be taken, held and enjoyed for the uses and purposes, and subject to the conditions in this decree set forth and in order of priority as herein determined; and

It is further ordered, adjudged and decreed that the owners of said ditches, tunnel and reservoirs be permitted to use and enjoy the appropriations of water therefor, during the times, in the order of the several priorities, and in the manner herein set forth and that all water Commissioners, their deputies and assistants, and all other officials, whose duty it is or may be to make or cause to be made distribution of water for irrigation in Water District No. 48, shall at all times observe, maintain and enforce the aforesaid decree and distribute water in accordance with the provisions thereof.

Done in open Court this 20th day of February, A. D. 1914.
By the Court.

Neil F. Graham, Judge.

[fol. 2926]

STATE OF COLORADO,
County of Larimer, ss:

I, W. P. Hurley, Clerk of the District Court, of the Eighth Judicial District of the State of Colorado within and for Larimer County, do hereby certify the foregoing to be a true, perfect and complete copy of Findings and Decree "In the Matter of the Adjudication of Priorities of Water Rights in Irrigation District No. 48, of the State of Colorado, for Irrigation and Other Beneficial Uses," in Case No. 2725, entered on the 20th day of February, A. D. 1914

In testimony whereof I have hereunto set my hand and
affixed the seal of said Court, at my office in Fort Collins
Colorado, this 23rd day of May, A. D. 1933.

W. P. Hurley, Clerk. (Seal.)

State of Colorado,
County of Larimer, ss:

I, Claude C. Coffin, Judge of the District Court of the
Eighth Judicial District of the State of Colorado within and
for the County of Larimer, do hereby certify that W. P.
Hurley, whose name is subscribed to the foregoing Certifi-
cate of Attestation, now is, and was, at the time of signing
and attesting the same, Clerk of the District Court of Larimer
County aforesaid, and keeper of the Records and seal thereof,
duly appointed and qualified to office; that full faith and
credit are and of right ought to be given to all his official acts
as such in all Courts of Record and elsewhere; and that his
said attestation is in due form of law, and by the proper
officer.

Given under my hand and seal this 23rd day of May, A. D.
1933.

Claude C. Coffin. (Seal)

State of Colorado,
County of Larimer, ss:

I, W. P. Hurley, Clerk of the District Court of the Eighth
Judicial District of the State of Colorado, within and for
Larimer County, do hereby certify that —— ——, whose
official signature is appended to the foregoing certificate,
was, at the time of signing the same, Judge of the District
Court of Larimer County, of the State of Colorado, duly
commissioned and qualified; that full faith and credit are
and of right ought to be given to all his official acts as such
in all Courts of Record, and elsewhere.

In testimony whereof, I have hereunto set my hand and
affixed the seal of said Court, at my office in Fort Collins
Colo., this 23rd day of May, A. D. 1933.

W. P. Hurley, Clerk. (Seal)

1408

and use of the same for mining milling manufacturing
irrigating Power Domestic and Domestic purposes.

The water to be conveyed through said Flumes and
Ditch shall be taken from the stream of water known as the
Cache La Poudre river and shall be taken from the said
stream on the north bank thereof at or near the place
where said stream intersects the north line of section
fourteen (14) of Township eight (8) north range seventy
(70) west of the sixth (6) principal meridian in Larimer
County in the State of Colorado and from said point as
the head of the said Flumes or Ditch shall run on the
north bank of said stream to the mouth of the Cannon
thence to the north and east of Pleasant Valley on the
south slope of the hill to a point at or near the quarter
section corner on the south line of section thirteen
(13) Township eight (8) north range seventy (70) west
of the sixth (6) principal meridian thence on the south
slope of the hill being the north or left bank of the
Cache La Poudre river to a point at or near the south
east corner of section thirteen (13) Township eight (8)
north range seventy (70) west thence by the most prac-
ticable route to a point at or near the centre of section
eighteen (18) Township eight (8) north range sixty
nine (69) west of sixth (6) principal meridian
Thence by the most practicable route with a fall
not to exceed ten (10) feet in the mile through Townships
eight (8) north range sixty nine (69) west eight (8)
north range sixty eight (68) west Township nine (9)

1109

north range sixty nine (69) west or township nine (9) north range sixty eight (68) west with the right to construct and maintain such other lateral or branch Ditches as the Company may deem necessary to the successful operation of its business

9th The Directors of said Company shall have the power to make such prudential By laws as they may deem necessary for the control and management of the affairs of said Company and the meeting of the stockholders or of the Directors shall be held at the town of Fort Collins in the county of Larimer in the State of Colorado The said Company shall have power to condemn and take for its right of way purposes a strip of land along the line or route aforesaid not exceeding fifty (50) feet in width and the intent hereof to construct the said work by Flume or Flumes over such part or parts of said route as are not practicable for the construction of a Ditch to be determined by the Directors of said Company

In witness whereof we have hereunto set and to two (2) other certificates the same in all respects as this subscribed our names and affixed our seals this sixteenth (16th) day of January in the year of our Lord one thousand eight hundred and seventy eight

desiring to form a Company for the purposes hereinafter specified do hereby, in pursuance of the several statutes of the State of Colorado, in such case made and provided, associate ourselves as a body corporate and declare;

I. That the name of such corporation shall be the Larimer County Reservoir Irrigating Company.

II. The objects for which said corporation is created are to survey, construct and maintain a ditch or canal which shall take water from the Cache à la Poudre River or Creek in Larimer County, State of Colorado; said ditch commencing and taking the water from said creek on the South side thereof at a point near the village of La Porte, and about fifty feet above the ditch heretofore constructed by the Larimer County Land Improvement Company, known as Canal No. Two, thence by the most eligible line, keeping above said Canal No. Two to the high ground above and northerly from a certain natural basin or depression commonly called Warren's Lake and which is upon Section Thirty Six in Township No. Seven North Range Sixty Nine (69) West, in said Larimer County, and lands adjacent; thence to and into said basin; and by means of said ditch to divert and discharge the waters of said stream into said basin so as to fill the same, until the water shall rise to the level of the lower embankment of said Canal No. Two; and from time to time to fill and keep full the said basin and discharge the waters therefrom, as the same shall be needed for the purpose of irrigation as hereinafter specified,

and to construct and maintain proper dikes, embankments and other proper works to retain and store the waters so discharged into said basin; and to construct and maintain another ditch or canal leading from said basin at the lower part thereof running from said basin by the most eligible route to and upon lands to be irrigated from said basin or reservoir and thence, and at other points along said last mentioned ditch or canal, by means of said ditch or canal and proper gates, sluices, sluice ways and other means to discharge the waters out of said basin and convey and distribute the same along the line of said ditch from time to time as the same shall be needed for the irrigation of the lands below said basin and in the vicinity of said ditch or ditches leading therefrom and for sale to the owners of such lands in that vicinity for the irrigation of said lands in order to the cultivation thereof.

III. The capital stock of said corporation shall be Ten Thousand Dollars; and shall consist of one hundred shares.

IV. The term of existence of said corporation shall be twenty years.

V. The business, property and affairs of said corporation shall be managed by three trustees; the names of three who shall manage its affairs for the first year of its existence are Ledru P. Rhodes, Thomas Macon and Ebenezer T. Wells.

VI. The principal office of said company shall be kept at Fort Collins, in the County of Larimer, and State of Colorado, and its principal business will be carried on at said County of Larimer.

VII. The trustees of said corporation shall have power to make such prudential bye-laws as they may deem proper, not incon-

sistent with the laws of this State, for the management of the affairs of said company.

Certificate of Incorporation

The Larimer County Ditch Company

Know All Men by these Presents:

That the undersigned Noah Bristol, Abraham L. Enigh, Edgar Avery, ~~William H. Avery~~ and Franklin C. Avery have and hereby do associate themselves together as a corporation under and by virtue of the laws of the State of Colorado and do hereby certify and declare

I First — That the corporate name of said Company is and shall be The Larimer County Ditch Company.

II Second — That the objects for which said Company is created are and shall be to construct, operate and maintain a ditch, taking water from the Cache La Poudre river for irrigation, agricultural, domestic, mechanical and piscatorial purposes; also to construct and maintain reservoirs on and near the line of said ditch, and to store water ~~therein~~ for the purposes aforesaid or any of them; Also to sell, lease and dispose of water rights in said ditch and the water flowing therein, and stored in its reservoirs, either in whole or in part, to any person or persons owning or occupying lands under said ditch to be used for the purposes aforesaid

or any of them; also to acquire by purchase, lease, condemnation, devise, gift or otherwise, lands lying along the proposed course and lands capable of irrigation from said Ditch when constructed; Also to purchase water and the right to use water for said ditch; Also to divert into said Ditch all water flowing and to flow in the Cache La Poudre River not otherwise appropriated which may be necessary to supply said ditch and reservoirs with water for the uses aforesaid; Also to construct a dam or dams in the Cache La Poudre River to divert water as aforesaid.

III Third— That the stream from the water is to be taken is and shall be the Cache La Poudre river.

IV Fourth— That the point or place on said stream at or near which the water is to be taken and shall be the point on the north side of said river about two and one half (2½) miles above La Porte in Larimer County Colorado, where the old "Abenchain Mill Race" commonly so called leaves the Cache La Poudre river.

V Fifth— That the line of said Ditch as near as may be stated shall be as follows: Commencing at said North Bank of the Cache La Poudre river at the point

aforesaid, running thence in an easterly direction on a grade of not less than one foot and not more than five feet to the mile as far as the Box Elder Creek in Larimer County Colorado, a distance of twenty miles more or less.

VI Sixth- That the use to which said water is to be applied is for irrigation, agricultural, domestic mechanical, and Municipal purposes as aforesaid, but chiefly for irrigating lands lying under said Ditch

VII Seventh- That the amount of Capital Stock of said Company shall be thirty thousand (30000) Dollars, which shall consist of three hundred (300) shares of the par value of one hundred (100) Dollars each.

VIII Eighth- That the term of existence of said corporation shall be twenty years.

IX Ninth- That the number of Trustees of said corporation shall be five, and the names of the Trustees who shall manage the affairs of such Company for the first year of its existence are and shall be Noah Bristol Abraham L. Enright, Franklin O. Avery Edgar Avery and William H. Avery.

X Tenth- That the town and County in which the principal office

of the company shall be kept in Fort Collins in the County of Larimer and the State of Colorado, and the name of the County in which the principal business of the corporation shall be carried on is and shall be Larimer County in said State.

XI Eleventh— That the Board of Trustees of said Corporation shall have power to make such prudential by-laws as they deem proper for the management of the affairs of the Company not inconsistent with the laws of this State for the purpose of carrying on all kinds of business within the objects and purpose of such Company.

Witness the hands and seals of said Incorporators this 25th day of February A D 1881 in duplicate.

CERTIFICATE OF INCORPORATION

OF THE

WATER SUPPLY AND STORAGE COMPANY.

-------(o)-------

KNOW ALL MEN BY THESE PRESENTS, That the undersigned, Isaac W. Bennett, Isaac Thomas, Gus. A. Lyckman, John Hayden, Andrew L. Johnson, Alex. Mead, Clinton Farrar, Lorton B. Williams and Samuel B. Southard have associated themselves together, and hereby do associate themselves together for the purpose of becoming a body corporate under and by virtue of the laws of the State of Colorado, and in accordance with the provisions of the laws of said State, do hereby make, execute and acknowledge, in quadruplicate, this Certificate of Incorporation, and do hereby certify and declare:

FIRST--That the corporate name of this Company is and shall be "THE WATER SUPPLY AND STORAGE COMPANY."

SECOND--That the objects for which said Company is incorporated are and shall be to acquire by every lawful means an additional supply of water for irrigationfor the benefit of the owners of water rights in and from that certain irrigating canal known as The Larimer County Ditch, now owned and controlled by The Larimer County Ditch Company, situated in the counties of Larimer and Weld, and State of Colorado; and among other means for accomplishing said desired end, to enter upon, prosecute and maintain the following enterprises--

1st--To acquire and become the owner by purchase, condemnation or other lawful means all the ditches, water rights, appropriations, franchises and privileges of The Larimer Water Supply Company, and by means of said ditches, and by extending and further prosecuting the construction thereof, and by the construction of new ditches, to take, divert and appropriate as much as possible of the unappropriated waters of the Grand, Michigan and Laramie Rivers and streams and waters tributary thereto, and to conduct such water so diverted by means of a system of ditches and dams into the several branches and the main stream of the Cache-la-Poudre River; but not so as to raise the waters thereof above ordinary high-water mark; and to take the said water or an equivalent amount, making due allowance for evaporation and seepage, out again and through the headgate of The Larimer County Ditch, and into and along the said Ditch for distribution among its water-right owners

who are or shall become stockholders in this Company.

2nd--To acquire, by lease, purchase, condemnation or other lawful means, those certain natural basins commonly known and designated as Chambers Lake, Trap Lake, Lost Lake and Laramie Lake, in Larimer County, Colorado, and all the rights, appropriations of water, privileges and franchises of The Larimer County Reservoir Company in connection therewith; also, the dam heretofore constructed by The Larimer County Reservoir Company, and all the appliances connected therewith, and to construct a new dam where a breach lately occurred in the natural embankment of said Chambers Lake, and by means of said dams and other appliances, from time to time hereafter, with water heretofore appropriated for and which can be used for that purpose, and only with such water and other water which can be appropriated for such purpose, to fill said Chambers Lake and to store such water therein, and afterwards, from time to time, to conduct said water so stored from said reservoir, and also water which this Company appropriates and stores in said other lakes of which Lost Lake and Laramie Lake will be filled from the head waters of the Laramie River as appropriated heretofore by ditches heretofore constructed by the Larimer County Reservoir Company, into and along the Cache-la-Poudre River; but not so as to raise the water thereof above ordinary high water mark, and to take the said water or an equivalent amount, making due allowance for evaporation and seepage, out again at and through the headgate of The Larimer County Ditch, and into and along said Ditch to be distributed among the water-right owners thereof who are or shall become stockholders in this Company.

3rd--To acquire and become the owner by lease, purchase, condemnation or other lawful means of those certain natural basins or depressions adapted to the storage of water near the line of The Larimer County Ditch, known as Reservoirs Numbers 1, 2, 3, 4 and 5 of said Company (Number 5 being that certain natural basin or depression known as "Long Pond") and sufficient contiguous lands needed to construct necessary embankments for the storage and discharge of water in said depressions, and also for the convenient and economical management and care of the same; and to acquire in like manner other convenient reservoir sites suited for the storage of water and located in the counties of Larimer and Weld if at any time hereafter said Company shall regard it practicable and feasible to construct other reservoirs than those above particularly mentioned; and to erect necessary embankments, flumes, headgates, weirs and other appliances to render any or all the natural depressions to be acquired by this Company well adapted for reservoirs for the storage of water, with means for drawing water gradually therefrom as needed for irrigation purposes, and to fill any or all of said reservoirs with water heretofore appropriated for filling Reservoirs Numbers 2, 3 and 4, and also with water not otherwise appropriated, by means of the Larimer County Ditch or any other ditch now constructed or hereafter to be constructed as feeders for all or any of said reservoirs, to conduct water thereto from any available sources of supply.

4th--Wherever practicable, to use the water stored by this Company in any of its reservoirs directly for the purpose of supplying the water-right owners in and under the Larimer County Ditch who are or shall become stockholders in this Company with water for irrigation purposes, and where any reservoir or water supply of this Company is so located that its water cannot directly be used to supplement the water supply of the said Larimer County Ditch water-right owners, then to acquire the right, either by contract with other corporations or persons or by any other lawful means, to obtain in exchange for the water stored in any of the reservoirs of this Company, or otherwise supplied by it, other water in equivalent amount or in such quantities as can be obtained in lieu thereof; which water so acquired in exchange or in

tion of the stored or supplied water, shall be conducted into and along the Larimer County Ditch or any portion thereof for the benefit of its water-right owners as aforesaid; also, to acquire by purchase, lease, condemnation or other lawful means the right to convey water from said reservoirs to other ditches or through Dry Creek in Larimer County, or by other means, back to the Cache-la-Poudre River to be used in exchange as aforesaid.

5th--To acquire and become the owner by purchase, or any other lawful means, of any existing appropriation or appropriations of water, either from the Cache-la-Poudre River or from any streams tributary thereto, or from any source whatsoever, and wherever practicable, withdue regard to the rights of intervening appropriators, to use such purchased appropriations by conducting such waters into the Larimer County Ditch, or diverting the same at its headgate for the use of said water-right owners as aforesaid; also, the right to buy and sell lands, and to stock and cultivate the same.

6th--To acquire any waste, drainage, flood or subterranean waters, and to construct necessary ditches to conduct such waters into the Larimer County Ditch, or any of the reservoirs of this Company, as aforesaid.

7th--To manage, control, maintain, keep in repair and improve from time to time, all reservoirs, flumes, headgates, feeders, ditches, wasteways outlets and other property of said Company; and to superintend and control the filling of any of its reservoirs and the storage of water therein, the drawing of water therefrom, and the delivery of said water for irrigation purposes to those entitled thereto.

8th--To borrow money for any corporate purposes when deemed necessary or expedient, and to secure the payment of the same by deeds of trust or mortgages on any or all of the corporate property or franchises; to raise funds, when in the judgment of the Board of Directors, expedient, at any time, by the sale or transfer of any of its reservoir sites, or by the sale of any of its stored waters, and to use the money so acquired for any proper corporate purposes.

9th--To exercise all the powers incidental to thoseabove enumerated and by any lawful means whatever to increase the irrigation supply of the water-right owners in the Larimer County Ditch.

THIRD--That the streams from which water is to be taken and diverted by this Company are and shall be the Cache-la-Poudre River, the Grand River, the Michigan River, and the Laramie River, and the several head streams and branches thereof; Dry Creek and Box Elder Creek, in Larimer County, Colorado, and other natural streams available for the purposes mentioned.

FOURTH--That the points or places on said streamsat or near which water is to be taken, as near as may now be stated, are as follows: 1st--At the headgate of The Larimer County Ditch, as now and heretofore located, on the north bank of the Cache-la-Poudre River, in Larimer County, Colorado.

2nd--Those natural depressions known as Chambers Lake, Trap Lake, Lost Lake and Laramie Lake, supplied bydivers creeks and tributaries of the Cache-la-Poudre and Laramie Rivers, In Larimer County, Colorado.

3rd--At certain points on the several streams of the headwaters of the Grand River, in Grand County, Colorado, said points being located where a ditch known as North Ditch would cross said streams, the outlet of said ditch being in a low pass in the Continental Divide, in the north-west quarter of Section 21, township 6, North of Range 75 west, and about three and one-half miles in a north-easterly direction from the old town of Lulu, in Grand County, Colorado; said ditch having a heavy grade towards said pass, and by means of dams where it crosses said several streams to divert and convey the waters of said several streams along said ditch into and through the said pass, into one of the head streams of the South Fork of the Cache-la-Poudre River. Said North Ditch being about six miles in length from its point of beginning to its outlet in pass as aforesaid; also, at certain points on other head streams of the Grand River, in Grand County, Colorado, said points being located where a ditch known as South Ditch would cross said streams, the outlet of said ditch being identical with the outlet of said North Ditch in aforesaid pass; said South Ditch having a heavy grade towards said pass, and by means of dams where said ditch crosses said several streams, to divert and convey the waters of said streams along said ditch into and through the said pass; the course of said North Ditch being in a general north-easterly direction from its head to its outlet, and the course of said South Ditch being in a general northerly direction from its head to its outlet. The outlet of said ditches being at a point in said pass 1350 feet south 23° 30" east from the north-west corner of Section 21, township 6, north, range 75 west, in Larimer County, Colorado; whence the waters diverted from said several streams into and through said pass, are to be conducted by means of the natural channel of one of the branches of the South Fork, the South Fork, and the main Cache-la-Poudre River to the headgate of the Larimer CountyDitch.

4th--At certain points on the several streams of the headwaters of the Michigan River, in Larimer County, Colorado, said points being located where ditches would cross said streams, the outlet of said ditches being in what is known as Cameron Pass, said ditches having a heavy grade towards said Pass, and by means of dams where said ditches cross said several streams, to divert and convey the water of said several streams along said ditches into and through said Pass into Joe Wright Creek to Chambers Lake, and thence through the natural channel of the main Cache-la-Poudre River to the headgate of the Larimer County Ditch.

5th--At certain points in the several streams of the headwaters of the Laramie River, in Larimer County, Colorado: Said points being located where a ditch would cross said streams, the outlet of said ditch being on the divide between Chambers Lake and the Laramie River, said ditch having a heavy grade towards said outlet, and by means of dams where said ditch crosses said several streams to divert and convey the water of said several streams into and along said ditch to and through said outlet into Chambers Lake; to store the same from time to time therein when desired, and from thence through the natural channel of the Cache-la-Poudre River to the headgate of the Larimer County Ditch; the course of said ditch being in a general southerly direction and being from six to twelve miles in length from its head to its outlet at Chambers Lake.

FIFTH--The said ditches, above described, are designed to be constructed of sufficient capacity to convey all the waters of the said Grand, Michigan and Laramie Rivers at the several points of diversion.

SIXTH--The use to which the water acquired by this Company is intended to be applied is for the irrigation of agricultural lands lying in the counties of Larimer and Weld under the ditch of The Larimer County Ditch Company.

SEVENTH--The amount of capital stock of said Company shall be sixty thousand dollars, to be divided into six hundred shares of One Hundred Dollars each. The subscription to said stock shall be limited and confined to those persons and bodies only, and their successors in interest, who have acquired or are entitled to water rights from The Larimer County Ditch Company for irrigation purposes. Such subscribers shall be entitled to take stock in this Company upon the ratio of one share of stock herein to one water right in The Larimer County Ditch Company, as heretofore defined by said Company.

EIGHTH--That the term of existence of said Company shall be twenty years.

NINTH--The affairs and management of said corporation is to be under the control of a board of seven directors. I. W. Bennett, Edward H. Hall, John Hayden, Alexander Mead, F. C. Avery, A. A. Edwards and Asaph E. Mead are hereby selected to act as said Board of Directors and to manage the affairs of said corporation for the first year of its existence, and until their successors are duly elected by the stockholders and duly enter upon the discharge of their duties.

TENTH--The operations of said corporation will be carried on in the counties of Larimer, Grand and Weld, in the State of Colorado, and the principal place of business and office of said corporation shall be located in the city of Fort Collins, in the county of Larimer and State of Colorado.

ELEVENTH--The Board of Directors shall have power to make such prudential by-laws as they may deem proper for the management of the affairs of said corporation, not inconsistent with the laws of the State of Colorado, for the purpose of carrying on all kinds of business within the objects and purposes of said Company. Said by-laws, among other things, shall provide that the water which is supplied and diverted by means of the enterprise of this Company into the Larimer County Ditch or into any of the reservoirs of this Company shall only be delivered to and distributed among stockholders in this Company who shall then own and control water rights in The Larimer County Ditch Company.

IN TESTIMONY WHEREOF, The said corporators have hereunto set their hands and seals on this twenty-third day of July, A. D. 1891, in quadruplicate.

CERTIFICATE OF RENEWAL AND EXTENSION OF THE TERM OF THE CORPORATE LIFE OF THE WATER SUPPLY AND STORAGE COMPANY, A CORPORATION, ORGANIZED AND EXISTING UNDER, AND BY VIRTUE, OF THE LAWS OF THE STATE OF COLORADO.

We, the undersigned, respectively the President, and Secretary of THE WATER SUPPLY AND STORAGE COMPANY, a corporation duly organized and existing under, and by virtue, of the laws of the State of Colorado, do hereby certify as follows, to-wit:

That heretofore and on Wednesday, December 27th, 1911, at the hour of 9 o'clock, at the offices of the said Company, No. 120, South College Avenue, Fort Collins, Colorado, a duly called, notified and published special meeting of the Stock Holders of THE WATER SUPPLY AND STORAGE COMPANY, was held, for the special purpose of considering and acting upon the special matter of a renewal or extension of the term of the corporate life of said Company.

That the term of the corporate life of said, THE WATER SUPPLY AND STORAGE COMPANY, expired July 23d, 1911, by limitation under its charter. That at such meeting the question of the renewal or extension of the corporate life of said Company for a period of Twenty (20) years from the date of the expiration or termination of the corporate life of said Company, was submitted to the vote of the Stock Holders of said Company. We do further certify that a majority of

1356

he stock of said Company was represented at said meeting; that he vote at said meeting was taken by ballot, as provided by aw, and that a majority of the entire outstanding Capital stock of said Company was voted by ballot in favor of a renewal of the term of the corporate life of said Company.

We, therefore, August C. Kauver, the President, and T. J. Gleasner, the Secretary of said Company, do hereby, under the seal of said Company, accordingly certify the fact, as provided in and by the terms and revisions of law in that behalf, and in pursuance of the provisions of Section 892 of the Revised Statutes of Colorado for the year 1908.

WITNESS our hands and the seal of said Corporation this the 6th day of January, 1913.

August C. Kauver
President of The Water Supply and Storage Company.

T. J. Gleasner.
Secretary of The Water Supply and Storage Company.

TO WHOM IT MAY CONCERN:

This is to certify that a special meeting of the stockholders of The Water Supply and Storage Company, a Colorado corporation, was held at Fort Collins, Colorado, on the 11th day of January, A. D. 1933, such meeting having been called by the stockholders representing at least ten per cent (10%) of the entire capital stock of the company outstanding. Notice of such meeting, as provided by law, was published at least once not more than thirty days and at least ten days prior to the date fixed for said meeting in a newspaper printed at Fort Collins, State of Colorado, and notice of said meeting was delivered personally or mailed to each stockholder thirty (30) days prior to the date of such meeting, there being represented at such meeting three hundred ninety-three (393) shares of the capital stock of said company out of a total of six hundred (600) shares outstanding.

At said meeting a resolution was passed to extend the corporate existence of this said corporation perpetually from and after the date of the expiration of its corporate life, the resolution receiving a MAJORITY vote of all the outstanding stock of the corporation. The president and secretary were authorized to certify this resolution under the corporate seal of the company, to file such certificate

with the Secretary of State of the State of Colorado, and to file duplicate certificate under seal of the company in the office of the Recorder of Deeds in each county or counties wherein the company may do business in the State of Colorado, and in pursuance of such resolution, we do hereby certify the same under the seal of the company.

A C Kluver
President.

Chas. M. Armstrong SECRETARY OF STATE

By Alf Suedeker DEPUTY

KNOW ALL MEN BY THESE PRESENTS, That we, Bruce Eaton, Benj. H.Eaton and Rollin Q.Tenney, residents of the State of Colorado, have associated ourselves together as a company under the name and style of THE DIVIDE DITCH COMPANY? for the purpose of becoming a body corporate and politic under and by virtue of the laws of the State of Colorado, and in accordance with the provisions of the laws of said State we do hereby make, execute and acknowledge in triplicate this certificate in writing of our intention so to become a body corporate under and by virtue of said laws.

FIRST: The corporate name and style of our said company shall be THE DIVIDE DITCH COMPANY.

SECOND: The object for which our said company is formed is to construct and maintain a ditch for the carrying of the water appropriated by Philip Wilson under the name of The Wilson Supply Ditch taking water from Sand Creek in Larimer County, Colorado, as appears from filings in the office of the Clerk of said Larimer County under date of July 22nd, 1897.

THIRD: The capital stock of our said company is Fifty Thousand Dollars, to be divided into Five Hundred shares of One Hundred Dollars each.

FOURTH: The life of our said company shall be twenty years.

FIFTH: The affairs and management of our said Company shall be under the control of a board of directors consisting of three members and Bruce Eaton, Benj.H.Eaton and Rollin Q.Tenney are hereby selected to act as such directors and to manage the affairs and concerns of our said company for the first year of its existence and until their successors are duly elected and qualified.

SIXTH: The operations of our said company will be carried on in the counties of Weld and Larimer, in said State of

Colorado, and the principal place of business and business office of our said company shall be located in the town of Eaton, in the county of Weld, State of Colorado.

SEVENTH: The Directors of our said company shall have power to make such prudential by-laws for the management of the affairs of this company, not in contravention of the statutes of the State of Colorado, as in their judgment shall be proper.

IN WITNESS WHEREOF we have hereunto set our hands and seals this 12 day of April, A.D.1901.

SECRETARY OF STATE.

ARTICLES OF INCORPORATION
OF
THE DIVIDE CANAL AND RESERVOIR COMPANY.

KNOW ALL MEN BY THESE PRESENTS: That Benjamin H. Eaton, Bruce G. Eaton, and Ellis Smith, residents of the County of Weld and State of Colorado, have associated ourselves together, and do hereby associate ourselves together, under the name and style of THE DIVIDE CANAL AND RESERVOIR COMPANY for the purpose of becoming a body corporate and politic under and by virtue of the laws of the State of Colorado; and in accordance with the provisions of the laws of the said State, we do hereby make, execute and acknowledge, in triplicate, this certificate in writing, of our intention so to become a body corporate and politic under and by virtue of said laws, and in so doing, do hereby certify as follows:

I.

The corporate name and style of our said company shall be "THE DIVIDE CANAL AND RESERVOIR COMPANY."

II.

The business for which our said company is incorporated is as follows:

(a) For the purpose of taking, diverting, carrying, distributing, and making distribution of water for irrigation of lands, storage and other beneficial uses, from Deadman's Creek and its various branches; and Sand Creek and its branches. The said creeks being tributaries of the Laramie River in Larimer County, Colorado; it being the intent to take, divert and carry the said waters so appropriated by means of ditches and natural water-ways across the divide between the headwaters of the Laramie River and the Cache la Poudre River, and to discharge the same into the north fork of the Cache la Poudre River and into Sheep Creek, a tributary of the Cache la Poudre River and thence down the

Cache La Poudre River and its tributaries as hereinafter described, to be again diverted from the Cache la Poudre River and its tributaries for direct irrigation of lands and for storage for the subsequent irrigation of lands situate in Larimer and Weld Counties and in the State of Colorado. The ditches and appliances by means of which such appropriation of water shall be made and its diversion affected for the use intended are hereinafter more particularly mentioned and described.

(b) For the purpose of taking, diverting, carrying, storing, distributing, and making legal appropriation of water for storage of water for irrigation of any and all unappropriated waters available for storage flowing and to flow in the Cache la Poudre River and its tributaries and derived either from natural, flow, flood, or seepage water, or from the underflow of said river by means of the canals, reservoirs, waterworks and appliances, hereinafter mentioned and described, said water to be diverted for storage and stored as aforesaid, for subsequent use in irrigation in reservoirs at all times and seasons of the year when water can lawfully be obtained from the said Cache la Poudre river, and its tributaries in any manner whatsoever.

(c) For the purpose of purchasing, acquiring, constructing, owning operating, maintaining and carrying on storage reservoirs, as hereinafter mentioned and described, and otherwise to carry out the purposes above named; also to construct, acquire, purchase, own, operate, and maintain the proper and necessary ditches and laterals for the carriage and distribution of water from said stream together with outlet and discharge ditches and laterals and the necessary appurtenances and appliances connected therewith so as to utilize and devote to beneficial uses all the water to be stored as aforesaid.

(d) For the purpose of acquiring lands, rights of way for its reservoirs, inlet, outlet, supply and discharge ditches and laterals and sites for its reservoirs from the public domain, state lands, and private owners, by grant, purchase, condemnation, compliance with the

acts of congress providing for the granting of rights of way for ditches and reservoir sites and otherwise.

(e) Also for the purpose of using said waters and the application of the same to lands owned by said company and the individual members thereof and for selling and disposing of rights to the use of water for irrigation and other beneficial uses to such other persons and corporations as may acquire the use of the same upon such prices and upon such terms and conditions as may be hereafter determined by the board of directors of our said company and as its by-laws duly enacted shall prescribe.

(f) Also exercise of the powers necessary for the development and successful operation of said enterprise with the power to borrow money and sell, mortgage, or pledge its property and franchises and any and every part thereof; to secure such loans and procure funds for the corporate purposes of our said company and generally to do and to perform all things necessary and proper to be done under and by virtue of its corporate powers and to carry out the business and purposes hereinafter set forth.

III.

The natural stream from which water is to be taken and appropriated and to be taken to supply the ditches and reservoirs of our said Company, are the Laramie River and its tributaries and the Cache la Poudre River and its tributaries all in the County of Larimer and State of Colorado. Said waters are to be taken and diverted by means of ditches and canals as follows:

THE COLUMBINE DITCH, commencing at a point on a branch of Deadman Creek about five hundred feet west of the center of Sec. 35, Tp. 10, N. R. 75 W. Thence in a northeasterly direction, crossing another branch of said Creek and taking the water therefrom, to a point about 200 feet east of the S. 1/4 corner of sec. 26, said Tp. and range. Thence in a northeasterly direction to a branch of the North Fork of the Cache la

Poudre River, where water is to be discharged to be carried down said Cache la Poudre River and its branches to the place of diversion; said ditch will also be extended, from, at or near said S. 1/4 corner of said sec. 26 in a northerly direction through sections 26, 23, and 22 in said township and range, to head of Deadman Ditch on main branch of Deadman Creek at a point 750 feet north of the S.E. corner of section 15, township 10, N. Range 75 west, which ditch intersects and is to divert water from, several branches of said Deadman Creek, and runs thence from the point last mentioned in a northeasterly direction through sections 15, 16 and 9, in said Tp. and Range and described as follows: From station 0 the point last mentioned said ditch line runs as follows:

Thence S. 65° West 1000 feet; thence N. 81° west 850 feet; thence S. 73° west 890 feet; thence N. 28° east 760 feet; thence N. 16° 30' west 900 feet; thence N. 72° west 1280 feet; thence N. 56° 30' west 1150 feet; thence N. 50° west 1200 feet; thence N. 35° west 1350 feet; thence N. 30° east 565 feet; thence N. 5° east 700 feet; thence N. 75° 30' west 1000 feet; thence N. 69° 30' west 900 feet to a point where Sand Creek shows a well defined channel. Thence following said Sand Creek through sections 9 and 4, Tp. 10 N. R. 75, W. and through sections 33, 34, 27 and 22, Tp. 11 N. R. 75 W. where the Divide Ditch, socalled, is taken from said Sand Creek, to divert the waters therefrom derived as aforesaid. Said DivideDitch commencing at Station 5 at a point 240 feet S. 22° 30' west of the 1/4 corner on the E. side of sec. 22, from which point we run: S. 87° E. 391 feet; N. 45° E. 1100 feet N. 74° 30' E. 390 feet; S. 84° E. 600 feet; N. 58° E. 650 feet to point of discharge into Sheep Creek, which is a tributary of the north fork of the Cache la Poudre river.

From Station 5 we run: S. 54° 30' W. 640 feet; S. 60°30' W. 360 feet; S. 9° 30' W. 1000 feet; S. 78° 30' W. 210 feet; S. 49° W. 300 feet; S. 5° W. 300 feet and interscets and discharges into Sheep Creek,

so-called, a tributary of the Cache la Poudre River through which said waters, diverted as aforesaid, are to be carried into the Cache la Poudre River and carried, thence, to the proposed place of diversion from the Cache la Poudre River; to be used for the filling of reservoirs and for the direct irrigation of lands.

That to conserve and facilitate the collection and distribution of the waters derived from the tributaries of the Laramie River as aforesaid, several storage reservoirs are to be constructed along Sand Creek aforesaid, in sections 9 and 4, Tp. 10 N. R. 75 W., and in section 33, and 4, in Tp. 11, N. R. 75 W. and at other places.

That all of said waters derived and appropriated from the tributaries of the Laramie River and from the Cache la Poudre River and its tributaries are to be diverted from said river at the head of and carried through the ditch of the North Poudre Irrigation Co. and the ditch of the Poudre Valley Irrigation Company, respectively.

The ditch of the North Poudre Irrigation Company is an irrigating canal taken from the Cache la Poudre river, a sworn statement of which describing said ditch and the line thereof as heretofore constructed, has been duly filed in the office of the county clerk and recorder of the county of Larimer and state of Colorado, reference to which is, here made; the canal of The Poudre Valley Irrigation Company is an irrigating canal taken from the Cache la Poudre river, a sworn statement of which describing said ditch andthe line thereof as heretofore constructed, has been duly filed in the office of the county clerk and recorder of the county of Larimer and state of Colorado, reference to which is hereby made; also the Larimer county ditch, so-called, an irrigating canal taking water from the Cahhe la Poudre river, a sworn statement of which describing said ditch and the line thereof as heretofore constructed has been duly filed in the office of the county clerk and recorder of the county of Larimer and state of Colorado. That from said ditches the waters are to be carried by means of laterals, supply or connecting ditches to be hereafter constructed connecting said ditches with the reservoirs of the said company hereinafter described.

IV.

The principal reservoirs, other than above mentioned, to be constructed and operated as aforesaid by our said company, are reservoirs known as Reservoir No. 8 and Annex, and are situated in the county of Larimer and state of Colorado, being located upon parts of sections 13 and 24, in township 8, north, range 69 west, and upon sections 18 and 19, in township 8 north, range 68 west as shown by maps and statement filed in the office of the county clerk and recorder of Larimer county, Colorado, reference to which is here made, and maps filed in the United States Land Office under the provision of the acts of congress of March 3, 1891, providing for granting rights of way for ditch and reservoir sites. That the outlet from said Reservoir No. 8 and Annex is at a point whence the south quarter corner of said section eighteen bears south 55° 50' west, a distance of 658 feet and runs thence in a south-easterly direction and discharges into the Larimer County Canal and also may be carried across the Larimer County Canal and discharged into Elder Lake from which ditch and lake the water is to be carried by means of other laterals and appliances to place or places of use.

V.

The amount of capital stock of our said company shall be $200,000, divided into 2,000 shares of the par value of $100 for each share, and such stock when fully paid shall be non-assessable except for the purposes of the maintainance, operation and repairs of the canal and the ditches connected therewith.

VI.

The term of existence of the said company shall be twenty years with power thereafter to extend the term and existence in form and manner as provided by the laws of the state of Colorado.

VII.

The affairs and management of our said company shall be controlled by a board of directors consisting of three persons. The names of the directors who shall manage the affairs of said company for the first year of its existence and until the first Monday in February, 1905, and until their successors are duly elected and qualified are Benjamin H. Eaton, Bruce G. Eaton and Ellis Smith.

VIII.

The principal office and place of business of said company shall be at Eaton, county of Weld and state of Colorado, and the operations of said company shall be carried on in the county of Larimer and state of Colorado, where the said reservoirs and ditches are located

IX.

The board of directors of said company shall have power to make such prudential by-laws as they may deem proper for the management of the affairs of said company not inconsistent with the laws of the state of Colorado.

IN WITNESS WHEREOF, we have hereunto set our hands and seals this eleventh day of January, 1904.

CERTIFICATE OF AMENDMENT OF THE ARTICLES OF INCORPORATION

OF THE DIVIDE CANAL AND RESERVOIR COMPANY.

Office of The Divide Canal and Reservoir Company,
Eaton, Colorado, February 2, 1909.

At the annual meeting of the stockholders of The Divide Canal and Reservoir Company, duly called and assembled at the office of the Company on the 2nd. day of February, 1909, the following proceedings, inter alia, were had and entered of record, to-wit:

"Stockholder C. M. Strickland presented the following resolution, and moved its adoption, which was duly seconded by stockholder, Thos. Halpin:

'Be it resolved, that paragraph seven of the Articles of Incorporation of The Divide Canal and Reservoir Company be amended so as to read as follows:

'The affairs and management of our said Company shall be controlled by a board of directors consisting of five persons."

The said resolution was submitted to a vote of the stockholders, as provided by law, and the vote being duly canvassed, the chairman announced that the said resolution amending the articles of incorporation of our said Company had been duly carried, the vote in favor of said resolution being 2000 shares, being the total number of shares of stock authorized and outstanding, the

same was duly carried in form and manner as provided by law.

CERTIFICATE OF EXTENSION OF CORPORATE LIFE

OF

THE DIVIDE CANAL AND RESERVOIR COMPANY.

KNOW ALL MEN BY THESE PRESENTS: That we, the undersigned, President and Secretary. respectively, of The Divide Canal and Reservoir Company, a corporation, duly organized and doing business under and by virtue of the laws of the State of Colorado, do, pursuant to said laws, make and execute, in quadruplicate, this certificate of extension of term and renewal of life of said corporation, as follows:

I.

That on the 24th day of November, 1923, persons owning more than ten per cent of the capital stock of The Divide Canal and Reservoir Company, a corporation , organized on the 11th day of January, 1904, and whose term of existence will expire twenty years from said date, give notice as by law provided, that a special meeting of the stockholders of the Divide Canal and Reservoir Company will be held in the office of said company in Eaton, Colorado, on the 5th day of January, 1924, for the purpose of considering and voting upon the question of extending the corporate life and term of existence for a period of twenty years from the date of expiration thereof, which notice was duly mailed to each and every stockholder of said company more than thirty days prior to the date of said meeting and was also published in the Eaton Herald, a weekly newspaper published in said Town of Eaton where the principal office of said company is located, for five successive weeks as by law provided.

II.

That upon the day mentioned for said meeting, and at the time and place mentioned in said notice, all the stockholders of said corporation convened and said special meeting of the stockholders was held for said purpose. That said meeting was duly organized

2986

and an inspection showed that all of the stock of said company, to-wit: 2000 shares, was present in person or duly represented by proxy; that at said meeting the following resolution was unanimously adopted, the vote thereon being taken by ballot and all the shares of the company being cast in favor thereof, viz:

RESOLUTION:

WHEREAS, The Divide Canal and Reservoir Company, a corporation was organized under the laws of the State of Colorado and became a corporation on the ~~11th day of February~~, 1904, and has ever since been and now is a corporation, actively engaged in the business for which it was incorporated, and said company has never been dissolved, and

Whereas, the term of existence or life of said company will expire on the ~~11th day of January~~, 1924 unless the same is extended as by law provided.

NOW THEREFORE, Be it Resolved, that the corporate life and term of existence of The Divide Canal and Reservoir Company be renewed and the same be extended for another term of twenty years from the date when said original term will expire, and to and including the ~~11th~~ 14th day of ~~January~~ February 1944, and that the President and Secretary of the company be and they are hereby empowered to make and execute under the seal of said corporation, a certificate showing that the life of said corporation has been extended for another period of twenty years from the expiration thereof.

That thereupon the corporate life of said company was extended until the ~~11th day of January~~ 14th day of February, A.D. 1944, and this certificate of said action is duly made, executed and filed in evidence thereof as by law proveded.

IN WITNESS WHEREOF, We have hereunto subscribed our names as such officers of said company, and have caused the corporate seal of said company to be hereunto affixed this 5th day of January, A.D. 1924.

Orrie Eaton President.

H. D. PARKER, Pres. G. F SMITH, Sec'y.

GREELEY, COLORADO

November 8, 1926.

Mr. R. A. Mosier,
Jelm, Wyo.

Dear Sir:

Just received yourinquiry of the 6th in regard to the amount of water run thru the tunnel. The running of water was not in my hands and will not vouch for the records that I have but am sending you the computation of the water from the records sent to me by Duvall.

There are some skips in these reports and I do not know whether the tunnel was shut down at those times or not. This record also includes any water run by the Water Supply & Storage Co and as yet I have no way of seggregating same from our water.

Duvall reports as follows:

March, 1926	3,542,400 cu. ft.
April	49,446,720
May	79,427,520
June	115,215,760
July	143,710,480
August	165,720,800
September	33,056,640
	590,120,320

(1926) - 590,120320
(1927) - 260,729,280
329 391, 40 Less than 1926.

If there is any particular importance to above, would suggest that you verify same from W. J. McAnelly as Duvall was supposed to make daily reports by phone to him.

Duvall's address is as follows:

J. H. Duvall
c/o Roy Fee
315 So. Loomis St
Fort Collins, Colo.

Duvall's reports start in on the 5th of September and run to the 23rd of September, it is my understanding that this is the time that the water for the Water Supply was running and we were to get an average of 13 feet and the balance was to go to the Water Supply. There are no reports for Sept. until the 5th of the month and I presume we were shut out. Duvall quit on the 23rd of Sept.

Sorry that I cannot do more for you and if there is any thing else that you want let me know.

Yours truly, G. F. Smith

DEFENDANT'S EXHIBIT X

No. 249

Seventy-five Thousand Cubic Feet.

PREFERRED WATER RIGHT

FROM

THE GILMORE RESERVOIR

THIS INDENTURE, Made and entered into this.....day of.....A. D. 19....., by and between **THE MOUNTAIN & PLAINS IRRIGATION COMPANY,** a Colorado corporation, hereinafter called "Grantor", and.....

of.....County, Colorado, hereinafter called the "Grantee", WITNESSETH:

WHEREAS, The Mountain & Plains Irrigation Company has, under authority of its stockholders and Board of Directors so to do, fixed and set apart thirty-seven million five hundred thousand cubic feet of water for irrigation purposes, to be derived from all sources of supply of water for irrigation purposes, of said company and stored in the Gilmore Reservoir of said company, said water to be divided into five hundred water rights of seventy-five thousand cubic feet of water each, and said company, having declared such water rights to the extent of 37,500,000 cubic feet to be a first and preferred charge and use in and upon the Bob Creek Ditch, The Columbine Ditch and the Gilmore Reservoir of said company, as now constructed and used, and

WHEREAS, Said company has authorized its president and secretary to sell such preferred water rights to a total amount of 37,500,000 cubic feet.

NOW, THEREFORE, Grantor, for itself, its successors and assigns, and in consideration of the sum of One Hundred Fifty and no/100 Dollars ($150.00) for each preferred right as hereinafter described, to it in hand paid, does hereby bargain, sell and grant to said grantee, his heirs and assigns forever, the following property, water rights, and hereditaments, that is to say: The right to.....(.....) preferred rights of 75,000 cubic feet each of water annually, to be stored in the Gilmore Reservoir of said company in Larimer County, Colorado, and delivered therefrom or from other sources of supply of said grantor; said amount of water shall be set apart and reserved for grantees under this and similar contracts, subject to the terms and conditions stated below and not otherwise, viz.:

CONDITION NO. I.

The place of delivery of water under this contract shall be at the present headgate of any intake ditch on the Cache la Poudre River, which ditch shall have and maintain a sufficient diversion dam, and headgate to divert such water from the said Cache la Poudre River.

CONDITION NO. II.

The place of measurement of said water shall be at the weir of any intake ditch on the Cache la Poudre River, receiving and carrying water for the grantee herein.

CONDITION NO. III.

The measurement of said water shall be made according to the methods then in effect and use by the office of the State Engineer of Colorado, and the Water Commissioner of the Water District in which the water herein sold shall be used.

CONDITION NO. IV.

The time of delivery of water each calendar year shall be between the 15th day of May and 10th day of September, as called for by the grantee, subject to the following provisions and conditions:

Condition No. 1: Grantee shall not be entitled to have water delivered to him at any time unless he alone, or in connection with other persons holding similar contracts, shall call for water in such amount and for such duration of time as shall be in conformity with the rules of the office of the State Engineer and Water Commissioner in control of the distribution of water from the said Cache la Poudre River.

Condition No. 2: For each delivery of water grantor must have at least twenty-four hours' notice in writing of the aggregate amount called for by all grantees uniting in such call, signed by such grantees, or their authorized agents, and designating the particular contracts on which said delivery is to be pro-rated, the delivery in cubic feet per second called for in the aggregate, the duration thereof; under these conditions grantee may call for water until in the aggregate the amount delivered to him equals the amount per annum hereby sold.

Condition No. 3: Grantee shall not be entitled to receive any water under this contract until he has paid to Grantor as maintenance charge for each and every year beginning with the date of this contract, the sum of Five Dollars ($5.00) for each preferred right of 75,000 cubic feet. Such maintenance charge shall be due and payable on the 1st day of March of each any every year. All delinquent maintenance charges shall draw interest at the rate of one per cent. per month from the date of delinquency to and until the same shall be paid

Condition No. 2: For each delivery of water grantor must have at least twenty-four hours' notice in writing of the aggregate amount called for by all grantees uniting in such call, signed by such grantees, or their authorized agents, and designating the particular contracts on which said delivery is to be pro-rated, the delivery in cubic feet per second called for in the aggregate, the duration thereof; under these conditions grantee may call for water until in the aggregate the amount delivered to him equals the amount per annum hereby sold.

Condition No. 3: Grantee shall not be entitled to receive any water under this contract until he has paid to Grantor as maintenance charge for each and every year beginning with the date of this contract, the sum of Five Dollars ($5.00) for each preferred right of 75,000 cubic feet. Such maintenance charge shall be due and payable on the 1st day of March of each any every year. All delinquent maintenance charges shall draw interest at the rate of one per cent. per month from the date of delinquency to and until the same shall be paid.

It is hereby agreed and understood between the grantor and the grantees herein, and the heirs and assigns of such grantee, that in case the grantor herein shall not desire to deliver to the grantee the water herein sold from the said Gilmore Reservoir of the grantor, then and in that case the grantor does hereby specially reserve the right to deliver the water herein sold to grantee from any or all sources of supply of said grantor.

It is understood that any assignee, claiming title under grantee herein, shall file in the office of the grantor's secretary, prior to receiving water hereunder, a properly executed assignment of this contract.

IN WITNESS WHEREOF, The Mountain & Plains Irrigation Company has caused its corporate name to be hereunto subscribed by its President, attested by its Secretary, and its corporate seal to be hereunto affixed this_____ day of_____, 19____.

No. 218103

Quit Claim Deed

This Deed, made this 4th day of October, in the year of our Lord one thousand nine hundred and nineteen, between The Divide Canal & Reservoir Company, a corporation duly organized and existing under and by virtue of the laws of the State of Colorado, and Bruce G. Eaton, as executor of the will of Benjamin H. Eaton, deceased, of the first part, and Roy A. Portner, of the County of Larimer and State of Colorado, of the second part:

Witnesseth, that the said parties of the first part, for and in consideration of the sum of One Dollar, to the said parties of the first part in hand paid by the party of the second part, the receipt whereof is hereby confessed and acknowledged, have remised, released, sold, conveyed, and Quit Claimed, and by these presents do remise, release, sell, convey and Quit Claim unto the said party of the second part, his heirs and assigns forever, all the right, title, interest, claim and demand which the said parties of the first part have in and to the following described ditch right of way and water rights, situate, lying and being in the County of Larimer, and State of Colorado, to-wit:

The Columbine Ditch, commencing at a point on Columbine Creek, a branch of Deadman Creek, about five hundred (500) feet west of the center of section thirty-five (35) township ten (10) North, range seventy-five (75) west of the 6th P. M.; thence in a northeasterly direction crossing another branch of said creek and other water courses and taking the water therefrom to a point about two hundred (200) feet east of the south quarter corner of Section twenty-six (26) of said township and range; thence in a northeasterly direction to a branch of the north fork of The Cache la Poudre River, where water is to be discharged to be carried down said Cache la Poudre River and its branches to the place or places of diversion; together with all appropriations, filings, rights of way, and water rights vested in connection with said Columbine Ditch, and the water diverted and which may be diverted and used by means of said Columbine Ditch from Columbine Creek,

and from the streams intercepted by means of said ditch, it being the intention hereby to convey every right held by the grantors in and to that certain ditch and project initiated by Phillip Wilson and Rollin Q. Tenney, the work whereon was commenced on the 7th day of September, 1897, as shown by Statement of claim filed by said Wilson and Tenney in the office of the County Clerk and Recorder of Larimer County, but as said Columbine Ditch is not and has not been connected with The Sand Creek Ditch System, the rights above conveyed shall not include any part of Priority Number Thirty-eight (38) for two hundred eighty-eight (288) cubic feet decreed to The Sand Creek Ditch System by The District Court of Larimer County in Case No. 1885 made and entered October 11th, 1906, on account [fol. 3026] of any statement therein contained as to The Columbine Ditch, with respect to any diversions or appropriations made or claimed by the party of the first part out of Sand Creek and Deadman Creek, and said decreed appro-riation of 288 cubic feet per second of said system shall continue to be owned, used and enjoyed as to Sand Creek and Deadman Creek to the full extent of 288 cubic feet per second by The Divide Canal & Reservoir Company, its successors and assigns.

To have and to hold the same, together with all and singular the appurtenances and privileges thereunto belonging, or in anywise thereunto appertaining, and all the estate, right, title, interest and claim whatsoever, of the said parties of the first part, either in law or equity, to the only proper use, benefit and behoof of the said party of the second part, his heirs and assigns forever.

In witness whereof the said The Divide Canal & Reservoir Company hath caused its corporate name to be hereunto subscribed by its * * * President, and its corporate seal to be hereunto affixed, attested by its Secretary, and the said Bruce G. Eaton, as Executor aforesaid, has hereunto subscribed his hand and seal the day and year first above written.

The Divide Canal & Reservoir Company, by Bruce G. Eaton, President. Attest: Rex C. Eaton, Secretary. (Seal.) Bruce G. Eaton, Executor of the Will of Benjamin H. Eaton, Deceased.

U. S. Revenue Stamps attached. $3.50. 8-10-19. B. G. E.

STATE OF COLORADO,
County of Weld, ss:

I, William P. Cudmore, a Notary Public in and for said Weld County, in the state aforesaid, do hereby certify that Bruce G. Eaton and Rex C. Eaton, who are personally known to me to be the same persons whose names are subscribed to the foregoing deed as having executed the same respectively as President and Secretary of The Divide Canal & Reservoir Co., a corporation, and who are known to me to be such officers, respectively, appeared before me this day in person, and severally acknow-edged: That the [fol. 3027] seal affixed to the foregoing instrument is the corporate seal of said corporation; that the same was thereunto affixed by the authority of said corporation; that said instrument was by like authority subscribed with its corporate name; that the said Bruce G. Eaton is the • • • President of said corporation, and the said Rex C. Eaton is the Secretary thereof; that by the authority of said corporation they respectively subscribed their names thereto as President and secretary, and that they signed, sealed, and delivered the said instrument of writing as their free and voluntary act and deed of said corporation for the uses and purposes therein set forth.

Given under my hand and notarial seal, this 4th day of October, 1919.

William P. Cudmore, Notary Public. (Seal.)

My commission expires Nov. 1, 1922.

STATE OF COLORADO,
County of Weld, ss:

I, William P. Cudmore, a Notary Public in and for the said Weld County, in the State aforesaid, do hereby certify that Bruce G. Eaton, Executor of the Will of Benjamin H. Eaton, deceased, who is personally known to me to be the person whose name is subscribed to the foregoing Deed, appeared before me this day in person and acknowledged that he signed, sealed and delivered the said instrument of writing as his free and voluntary act and deed, for the uses and purposes therein set forth.

Giver under my hand and notarial seal, this 4th day of October, 1919.

William P. Cudmore, Notary Public, (Seal.)

[fol. 3050] DEFENDANT'S EXHIBIT D-1

JOHN MCNABB, a witness on behalf of the claimant above named, being first duly sworn, testifies as follows:

Examination by Mr. W. A. Bryans:

Q. State your name, please.
A. John McNabb.
Q. Where do you reside, Mr. McNabb?
A. Fort Collins.
Q. Have you been employed by The Mountain & Plains Irrigation Company?
A. Yes, sir.
Q. In what capacity?
A. Foreman.
Q. Where; on what work?
A. Bob Creek Ditch work.
Q. When did you first see the Bob Creek Ditch?
A. In 1903.
Q. When did you next see it?
A. I went there with Mr. Portner in 1919, I had seen it between times, but don't recollect just when.

Q. What improvements did you find at the time you went there in 1919?

A. The ditch was all completed except the upper end, there were about 500 feet——

Q. Aren't you referring to 1903. I said in 1919 what improvements did you find the ditch?

A. It was all completed and buildings up when I went there in 1919.

Q. In 1903, what was the condition of the ditch?

A. The upper end wasn't completed, about 500 feet that wasn't damned, I completed to about 400 feet of the upper end connected with the creek, and had it up to the flume, there is about 60 or 75 feet of flume, I completed the ditch on the upper end.

Q. After you had completed the work which you stated you did, was the ditch able to carry water?

A. Oh yes.

[fol. 3051] Q. Did it carry water?

A. Well, of course, I don't know, I didn't see it run water.

Q. Have you been in irrigation work for a number of years?

A. Yes, sir.

Q. How long?

A. Since 1891.

Q. In this community.

A. Yes, sir.

Q. From your observation of the ditch, state your opinion as to whether or not the ditch had carried water?

A. Yes, sir, I think it had.

Q. When you went there in 1919 in the fall, did you take a crew of men with you?

A. Yes, sir.

Q. In 1903, did you have a crew of men there?

A. Yes, sir.

Q. About how many men?

A. Seventeen.

Q. How long were you there.

A. About two weeks.

Q. And what improvements, if any, were there at that time?

A. Well, the ditch was all done except the upper end.

Q. Where there any buildings?

A. Yes, sir.

Q. What did they consist of, the buildings?

A. There were three cabins there and a barn and a little water shed house.

Q. By whom were you employed at that time?

A. In 1903, by The Larimer and Weld Reservoir Company.

Q. Do you remember the name of the man who was in charge?

A. Mr. Smille from Eaton.

Q. Is he living?

A. I don't know.

[fol. 3052] Q. Was the weir there?

A. The lower weir was there, the old one, yes, sir.

Q. Can you describe the flume that was there at that time?

A. Yes, sir.

Q. Did you build the flume in 1903?

A. In 1903 I built it.

Q. There was no flume there?

A. No, just a rock slide.

Q. What work did you do in 1919?

A. I built the telephone line clear into camp about 15 miles, then put in some waste gates and cleaned out the ditch.

Q. Who did you do that work for?

A. The Mountain & Plains Irrigation Company.

Q. Have you been employed in the ditch since that date, since 1919?

A. Yes, sir.

Q. For how long?

A. During the summer season, generally about six months in the summer.

Q. Each year?

A. Yes, sir.

Q. And what are your duties, what do you do?

A. Oversee the work and handle it.

Q. Do you go there early in the spring and help remove the snow and oversee that work?

A. Yes, sir.

Q. You are the superintendent of the ditch?

A. Yes, sir.

Q. And how late generally do you stay there?

A. Well, when we are working there, I generally stay until about the first of August, in late years we haven't been doing much the latter part of the year.

Q. For how long a period of time does the water run in the ditch?

A. It runs from along the first of May up to the middle of July.

[fol. 3053] Q. About when does it reach its peak, high point?

A. Along the first of June.

Q. Describe the weir to the Referee that's used for the purpose of calculation.

A. It's 16 feet long, 10 feet wide and 4 feet high.

Q. Do you make daily readings on the weir?

A. Yes, sir.

Q. Does it vary during the day considerably at that altitude?

A. Yes, sir.

Q. When does it reach its highest point, generally?

A. Between three and five o'clock, generally depends on the weather.

Q. At what height have you seen the water in the weir during the peak flow between the hours of three and five o'clock?

A. It runs up to about 1.6 feet in depth, that's about as high as I have seen it.

Q. In your opinion as an irrigation man, how much water would be running in the ditch at a time when the weir showed a rating of 1.6 feet?

A. I would think 50 or 60 feet. I don't have any table for the amount of feet, just read the depth and send that in.

Q. When do you state that you have seen it as high as 1.6 feet?

A. I don't know just when, this year it run 1.3 feet for top, I don't know that its runs up to 1.6 this year.

Q. Does it nearly every year reach a reading of 1.6?

A. I wouldn't think it would, it might most every year for a short time, that's not an average, just the highest peak for the day.

Q. Did you construct this feeder ditch, which has been referred to by Mr. Portner?

A. That was already built.

Q. You stated, Mr. McNabb, that it was in 1919 that you built the telephone line, wasn't that in 1921?

A. 1921, yes, sir.

That's all.

(Here follow photolithographs of side folios 3054, 3055 and 3056)

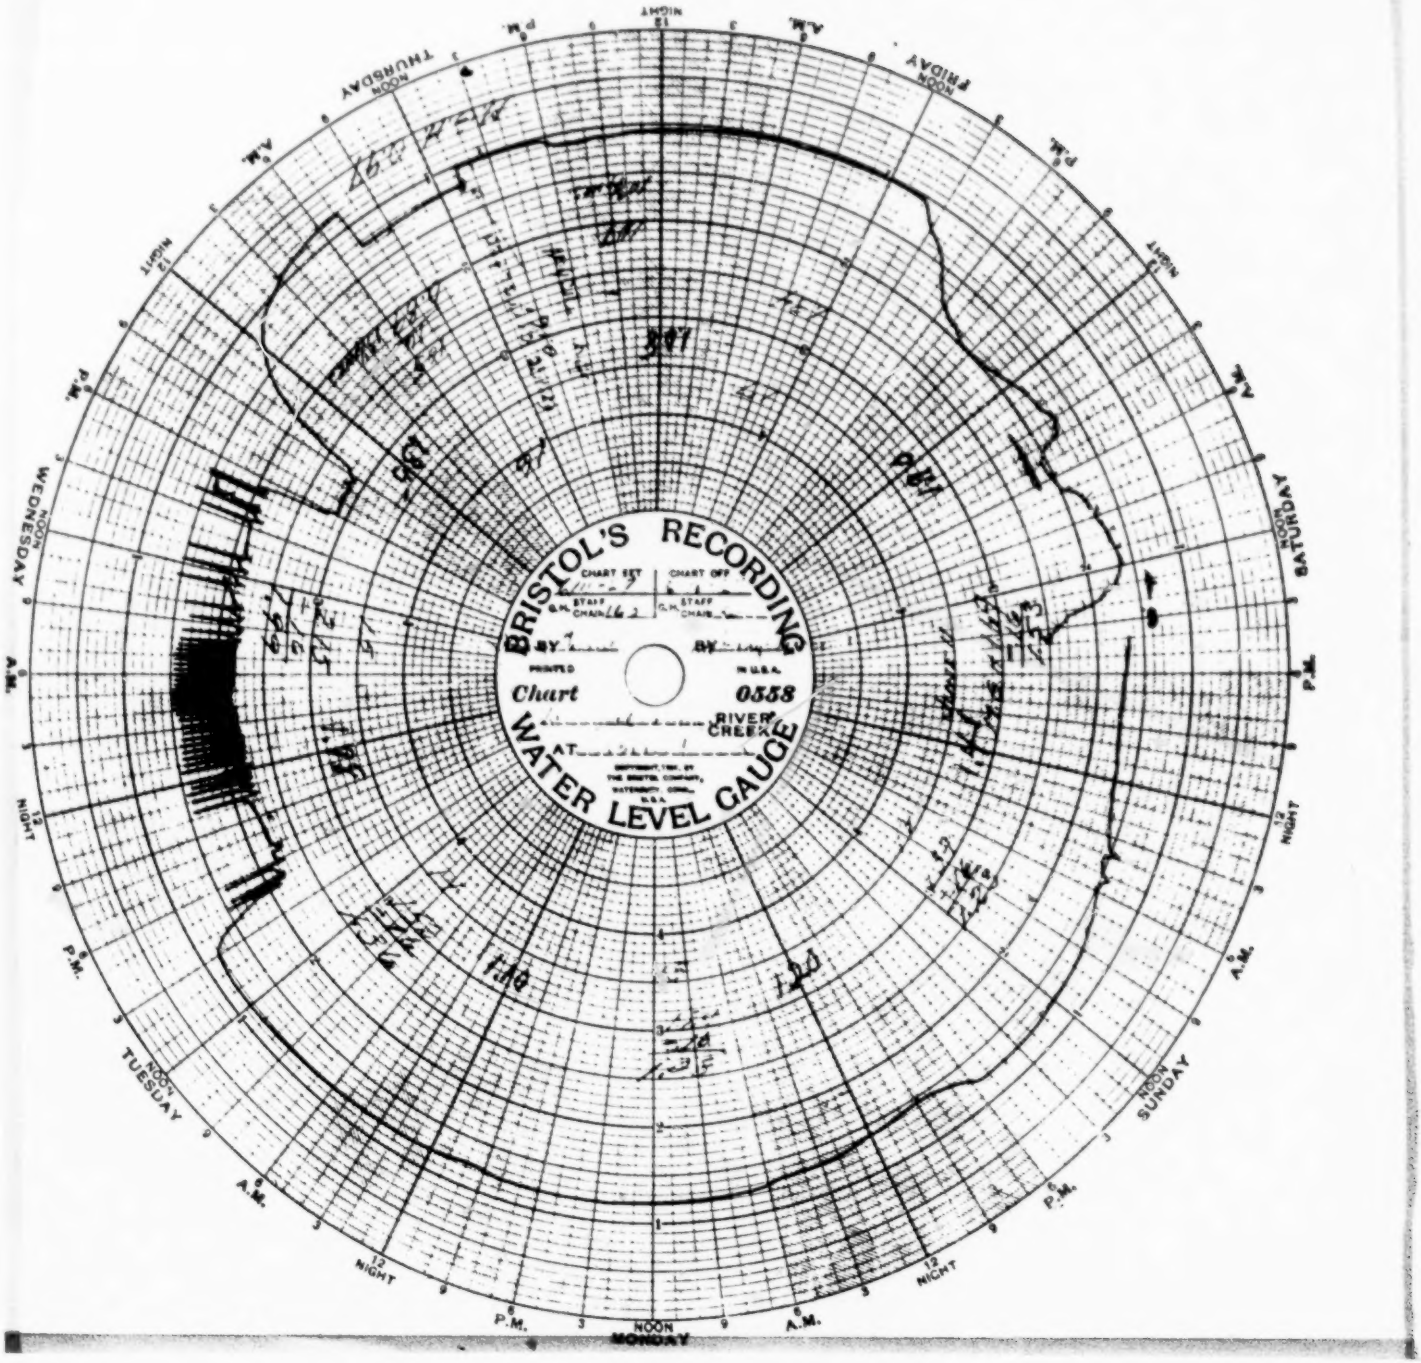
DEFENDANT'S EXHIBIT I-1



FOLD-OUT IS TOO LARGE TO BE FILMED

[fol. 3060] DEFENDANT'S EXHIBIT K-1

IN THE DISTRICT COURT

STATE OF COLORADO,
County of Larimer, ss:

In the Matter of the Adjudication of Priorities of Right to the Use of Water in Water District No. 48, Division No. 1, of the State of Colorado

STATEMENT OF CLAIM OF PRIORITY OF THE DIVIDE CANAL AND RESERVOIR COMPANY

Comes now The Divide Canal and Reservoir Company, as claimant of water priorities for irrigation and storage in and for said water district No. 48, of the state of Colorado, and makes and files this its statement of claim under oath pursuant to the statute in such case made and provided, as follows:

I

That petitioner is a corporation, duly organized, existing, and doing business under and by virtue of the laws of the state of Colorado; that petitioner is the owner of the Sand Creek Ditch and Reservoir system, so-called; being a system of ditches and reservoirs constructed for the purpose of taking, diverting, and appropriating for beneficial uses, water from the Columbine creek, and its branches, from the Deadman creek, and its branches, and from Sand creek, and its branches, tributaries of the Laramie river, all in Larimer county, Colorado, and to carry the same through and along Sand creek to a point on Sand creek hereinafter described, and thence diverted from Sand creek and carried over and across the Divide, between the head branches of the Laramie and Poudre river, into Sheep creek, a tributary of the Poudre river, to be thence carried down the Poudre river, to sundry places of diversion, all said waters to be used for direct irrigation and for fill-
[fol. 3061] ing reservoir No. 8 and other reservoirs, by claimant and its stockholders by means of the said resevvoirs and the ditch of The North Poudre Irrigation Company, the ditch of The Poudre Valley Irrigation Company, and the ditch of The Larimer and Weld Irrigation Company, in water district No. 3, of the state of Colorado.

II

That it is proposed by said system of ditches and reservoirs to divert and appropriate by means thereof all the water collected and flowing in the south branch of Columbine creek, north branch of Columbine creek, the several branches of Deadman creek, at the points of crossing said streams and water courses, by said line, and also to divert and appropriate the water flowing and to flow in Sand creek, down to the place of diversion from said Sand creek; said waters consisting of the natural flow of all of said streams and their tributaries, the water derived from floods and melting snows, coming into said streams and waterways from the territory adjacent and tributary thereto; that said Sand creek ditch system was originally located and constructed as three separate ditches, to-wit: the Columbine ditch, the Deadman ditch, and the Sand creek ditch, all of which are now surveyed, laid out, and combined as a single ditch and reservoir system, for the purpose of collecting, diverting, and conveying all the water from the said streams, waterways, natural channels, and from the hills, territory, and mountain ranges over and through which said ditch system extends, and to and into the north fork of the Cache la Poudre river, as aforesaid, from thence to be diverted from said river for beneficial uses as aforesaid.

III

That the line and survey of said combined ditch and reservoir system is shown upon the map hereto attached and described by the survey and field notes thereof, as follows, to-wit:

[fol. 3062] Commencing at the original headgate of the Columbine ditch, so-called, at a point on the south branch of the Columbine creek, north 24° 50′ west 2120 feet from the south ¼ corner of section 35, township 10 north, range 75 west. Thence north 38° 15′ east, 1325 feet; thence north 66° 30′ east, 310 feet; thence south 74° 30′ W. 515 feet; thence north 0° 15′ west, 280 feet; thence north 44° 0′ west, 1085 feet; thence north 22° 55′ west 882 feet; thence north 19° 45′ east, 510 feet; thence north 39° 45′ east, 423 1460 feet; thence north 53° 0′ east, 450 feet; thence north east 550 feet; to a point north 76° 40′ east 1200 feet from the south ¼ corner of section 26, said township and range,

to the north fork of the Poudre river, into which, said ditch originally emptied and discharged, the said ditch being changed, starting at station No. 9 as shown by the map, 1200 feet from the said north fork of the Cache la Poudre river, running thence in a northwesterly direction to the original headgate of the Deadman ditch as shown upon said map, said head being located at the point north 22° 10′ west, 950 feet from the south ¼ corner of section 26, township 10 north, range 75 west, said combined ditch running on the original line of the Deadman ditch; thence north 1° 10′ east 727 feet; thence north 41° 30′ west, 640 feet; thence north 15° 15′ west, 286 feet; thence north 12° 0′ east, 410 feet; thence north 63° 30′ west 1135 feet; thence north 63° 30′ west, 637 feet; thence north 38° 35′ west 655 feet; thence north 71° 25′ west, 603 feet; thence north 61° 10′ east, 830 feet; thence north 20° 45′ west, 571 feet; thence north 82° 0′ east, 547 feet; thence north 54° 25′ east, 2155 feet; thence north 46° 10′ west, 553 feet; thence south 84° 0′ west, 490 feet; thence north 55° 0′ west, 352 feet; thence south 58° 0′ west, 905 feet; thence north 69° 45′ west 520 feet; thence south 75° 50′ west 630 feet; thence north 44° 15′ west 1010 feet; thence north 72° 0′ east, 1460 feet; thence north 53° 0′ east 450 feet; thence north 27° 50′ east, 710 feet; thence south 76° 15′ west 1200 feet; thence north 82° 40′ west, 818 feet; thence north 31° 0′ west, 290 feet; thence north 31° 0′ east, 1063 feet; thence north 15° 30′ west, 570 feet; thence north 66° 30′ east, 627 feet; thence north 52° 20′ east, 1115 feet; thence north [fol. 3063] 24° 0′ east, 360 feet; thence north 25° 15′ west, 350 feet; thence south 61° 15′ west, 819 feet; thence north 82° 55′ west, 907 feet; thence north 57° 0′ west, 755 feet; thence north 15° 0′ west, 740 feet; thence north 80° 28′ west, 643 feet; thence north 70° 0′ west, 1485 feet; thence north 50° 10′ west, 930 feet; to a point south 7° 25′ E. 2100 ft. from NW cor. sec. 15-10-75 to Sand creek, another tributary of the Laramie river, where said Columbine and Deadman ditches empty and discharge the waters appropriated from said stream, thence following the channel of Sand creek, and using the same as a ditch to carry said waters, and by various courses and distances for about 3½ miles to the original headgate of Sand creek ditch, so-called, said Sand creek ditch to be hereafter used to carry

and discharge the accumulated waters from all sources over the Divide into the north fork of the Cache la Poudre river for the purposes above mentioned, said point of departure or head of Sand creek ditch being at a point south 84° 45′ east, 560 feet, from the south ¼ corner of section 22, township 11, north, range 75 west; thence north 29° 0′ east, 290 feet; thence north 42° 0′ east, 1000 feet; thence north 88° 45′ east, 260 feet; thence north 9° 30′ east, 700 feet; thence north 22° 30′ east, 195 feet; thence north 22° 30′ east, 50 feet; (the last 2 courses and distances being through tunnel;) thence north 11° 30′ east, 128 feet; thence north 56° 30′ east, 230 feet; thence north 55° 0′ east, 650 feet; thence south 87° 0′ east, 160 feet; thence north 60° 30′ east, 530 feet; thence north 40° 0′ east, 300 feet; thence north 46° 45′ east, 490 feet; thence north 77° 30′ east, 415 feet; thence south 81° 30′ east, 388 feet; thence south 82° 0′ east, 480 feet; thence north 81° 0′ east, 195 feet; thence north 35° 30′ east, 265 feet; thence north 58° 30′ east, 180 feet; to a point south 10° 25′ west, 1500 — from the north ¼ corner of section 23, township 11, north, range 75 west, to Sheep creek, a tributary of the north fork of the Cache la Poudre river, said waters being conveyed along and through a channel or waterway of Sheep creek to the north fork of the Cache la Poudre river, and thence carried down said river and again diverted by the ditches and ditch systems above mentioned.

IV

The claimant is also the owner of four small reservoirs, [fol. 3064] numbered one, two, seven, and ten, along the line of Sand Creek above mentioned in which the waters derived from Columbine and Deadman creek are to be collected and stored for temporary purposes, and to be afterwards drawn off and carried down Sand creek through the ditches and outlets above described to the Cache la Poudre river, the location of said reservoirs being shown upon the map hereto attached.

V

That part of the ditches above described, formerly known as Columbine ditch, was laid out and built to the dimensions and capacity, as follows: width on bottom about 4 feet,

depth about 3 feet, width on top, 7 feet, and grade of about 10 feet to the mile, with a capacity for the carriage of water of about 50 cubic feet per second of time.

That the Deadman ditch, so-called, at the head, has dimensions and capacities of about 4 feet wide on the bottom, 7 feet wide on top, 3 feet deep, and a carrying capacity of about 50 cubic feet per second of time, increasing in size and capacity so as to take and carry the increased quantities derived from the various branches of Deadman creek and streams and water courses crossed by said ditch, down to Sand creek, and at said Sand creek and above where said ditch empties into Sand creek, it has the dimensions and capacity following: 8 feet wide on the bottom, 13 feet wide on the top, carrying 3 feet in depth of water, with a grade of about 10 feet to the mile and a carrying capacity of 250 cubic feet per second of time; that the capacity of said ditch from the point where it leaves Sand creek, and originally known as Sand creek ditch, running thence to Sheep creek, is as follows: Width on bottom about 10 feet, width on top about 16 feet; carrying 5 feet in depth of water with a grade of 10 feet to the mile, with a carrying capacity of 500 cubic feet per second of time; that the entire length of said ditch system is about eleven miles.

That work was commenced on said system by surveys during the month of June, 1897, and by actual work of construction on the right of way, was commenced in June, 1899, since which time work has been prosecuted with diligence and water diverted by means of said ditches and carried over the divide as aforesaid into Sheep creek and thence down the Cache la Poudre river and applied to the beneficial uses as aforesaid.

Wherefore, claimant prays that he may be allowed appro- [fol. 3065] priations of water from the said Columbine, Deadman, creeks and their branches, in the amount of two hundred and fifty (250) cubic feet per second of time, with the right to carry the same through, and along, the channel of Sand creek, and again divert the same to the Cache la Poudre river, through the Sand creek ditch above described.

That claimant be made a further appropriation from Sand creek and the waters coming into the same from its watershed and tributaries to the amount of two hundred and fifty (250) cubic feet per second of time, or in all of

five hundred (500) cubic feet per second of time for the uses and purposes aforesaid, said appropriations to date from the 15th day of June, 1899.

James W. McCreery, 7 and 9, Bank Block, Greeley, Colorado, Attorney of claimant, The Divide Canal and Reservoir Company.

STATE OF COLORADO,
County of Weld, ss:

Bruce G. Eaton, being first duly sworn, deposes and says:

That he is the president of The Divide Canal and Reservoir Company, claimant above named; that he has read the above and foregoing statement, and knows the contents thereof; that the same is true to the best of his knowledge and belief.

——— ———.

Sworn to before me and subscribed in my presence by the said Bruce G. Eaton this second day of March, A. D. 1906. My commission expires February 20, 1908.

Henry Clay Luther, Notary Public in and for the county of Weld and state of Colorado.

[fol. 3066] [Endorsed:] No. 1885. In the District Court of Larimer County. In the matter of the adjudication of priorities of right to the use of water in Water District No. 48, Division No. 1, of the State of Colorado. Statement of claim of priority of The Divide Canal and Reservoir Company. Jas. W. McCreery, Esq., Greeley, Colorado, attorney for said company.

[fol. 3067] DEFENDANT'S EXHIBIT L-1

IN THE DISTRICT COURT

STATE OF COLORADO,
County of Larimer, ss:

In the Matter of the Adjudication of Priorities of Right to the Use of Water in Water District No. 48, Division No. 1, of the State of Colorado

Amendment to Statement of Claim to Priority of The Divide Canal and Reservoir Company

Comes now The Divide Canal and Reservoir Company, as claimant of water priorities for irrigation and storage

in and for said water district number forty-eight of the state of Colorado, and makes and files this its amendment to the statement of claim heretofore filed herein, as follows:

I

That the description and meander of Sand creek between the points where the Deadman ditch discharges into Sand creek, and where the Sand creek ditch so-called, is taken and diverted therefrom, is as follows:

Commencing at a point 2100 feet south, 7° 25′ east from south west corner of section 10, township 10 north, range 75 west; thence north 47° 0′ west, 910 feet; thence north 35° 0′ west, 1540 feet; thence north 22° 20′ east, 475 feet; thence north 19° 0′ east, 530 feet; thence north 21° 0′ west, 275 feet; thence north 58° 10′ west, 980 feet, through reservoir No. 2; thence north 62° 30′ west, 295 feet, site for dam; thence south 19° 0′ west, 374 feet, along dam; thence north 59° 0′ west, 780 feet along creek; thence north 45° [fol. 3068] 45′ west, 500 feet; thence north 82° 0′ west, 510 feet; thence south 23° 0′ west, 500 feet to reservoir No. 10; thence south 75° 0′ west, 1150 feet; thence north 30° 0′ west, 700 feet; thence north 19° 30′ west, 280 feet; thence north 9° 0′ east, 167 feet; thence north 4° 0′ west, 360 feet; thence north 28° 30′ east, 300 feet; thence north 56° 30′ east, 1060 feet; thence north 75° 30′ east, 255 feet; thence north 29° 0′ east, 420 feet, through reservoir No. 7; thence north 0° 15′ east, 475 feet, through reservoir No. 7; thence north 13° 0′ east, 600 feet, through reservoir No. 7; thence north 25° 30′ east, 315 feet, through reservoir No. 7; thence north 22° 0′ east, 390 feet; thence north 19° 30′ east, 600 feet; thence north 2° 30′ west, 445 feet; thence north 15° 0′ east, 90 feet; thence north 27° 30′ east, 400 feet; thence north 42° 30′ east, 185 feet; thence north 52° 30′ east, 207 feet; thence north 79° 0′ east, 200 feet; thence north 42° 0′ east, 120 feet; thence north 14° 30′ east, 168 feet; thence north 51° 30′ east, 420 feet; thence north 42° 0′ east, 150 feet; thence north 75° 0′ east, 148 feet; thence north 54° 0′ east, 230 feet; thence north 35° 30′ east, 270 feet; thence north 21° 30′ east, 205 feet; thence north 62° 0′ east, 140 feet; thence south 88° 30′ east, 230 feet; thence north [fol. 3069] 66° 30′ east, 180 feet; thence north 88° 0′ east, 165 feet; thence north 49° 0′ east, 170 feet; thence north 46° 0′ east, 200 feet; thence north 41° 0′ east, 158 feet;

thence north 61° 0′ east, 190 feet; thence north 38° 30′ east, 145 feet; thence north 51° 0′ east, 285 feet; thence north 19° 0′ east, 125 feet; thence north 34° 30′ east, 150 feet; thence north 18° 30′ east, 215 feet; thence north 46° 0′ east, 116 feet; thence north 5° 0′ east, 86 feet; thence north 19° 30′ east, 170 feet; thence north 24° 0′ east, 180 feet; thence north 15° 0′ west, 140 feet; thence north 18° 30′ east, 205 feet; thence north 6° 0′ east, 110 feet; thence north 6° 0′ west, 125 feet; thence north 5° 30′ east, 240 feet; thence north 36° 0′ east, 140 feet; thence north 64° 0′ east, 270 feet; thence north 45° 0′ east, 156 feet; thence north 46° 0′ east, 160 feet; thence north 71° 0′ east, 135 feet; thence north 60° 0′ east, 340 feet; thence north 67° 30′ east, 240 feet; thence north 54° 0′ east, 305 feet; thence north 86° 30′ east, 180 feet; thence north 56° 0′ east, 175 feet; thence north 46° 0′ east, 185 feet; thence north 24° 40′ east, 165 feet; thence north 37° 30′ east, 165 feet; thence north 37° 30′ east, 140 feet; thence north 29° 30′ east 125 feet; thence north 21° 30′ east, 140 feet; thence north 0° 0′ east, 215 feet; thence north 20° 30′ west, 195 feet; thence north 6° 0′ west, 182 feet; thence north 24° 30′ west, 150 feet; thence north 6° 0′ west, 93 feet; thence north 37° 30′ west, 90 feet; thence south 72° 0′ west, 73 feet; thence north 70° 0′ west, 70 feet; thence north 14° 0′ east, 72 feet; thence north 2° 0′ west, 90 feet; thence north 12° 30′ west, 140 feet; thence north 14° 30′ east, 180 feet; thence north 43° 30′ east, 85 feet; thence north 79° 30′ east, 130 feet; thence north 69° 30′ east, 115 feet; thence north 17° 30′ east, 140 feet; thence north 31° 30′ east, 140 feet; thence north 22° 0′ east, 68 feet; thence north 20° 0′ east, 100 feet; thence north 3° 0′ east, 76 feet; thence north 8° 30′ east, 96 feet; thence north 12° 30′ west, 145 feet; [fol. 3070] thence north 7° 30′ west, 98 feet; thence north 28° 30′ east, 55 feet; thence north 0° 30′ east, 55 feet; thence north 17° 30′ east, 98 feet; thence north 12° 30′ east, 50 feet; thence north 11° 0′ west, 65 feet; thence north 34° 0′ east, 52 feet; thence north 3° 0′ east, 63 feet; thence north 21° 30′ east, 70 feet; thence north 8° 0′ west, 80 feet; thence north 6° 30′ east, 76 feet; thence north 51° 30′ east, 100 feet; thence north 21° 0′ east, 145 feet; thence north 37° 30′ east, 140 feet; thence north 4° 0′ east, 220 feet; thence north 5° 0′ east, 106 feet; thence north 41° 30′ west, 160 feet; thence north 8° 30′ east, 85 feet; thence north 39° 0′

west, 172 feet; thence north 31° 30′ west, 230 feet; thence north 48° 0′ east, 62 feet; thence north 21° 30′ west, 83 feet; thence north 18° 30′ west, 53 feet; thence north 2° 0′ east, 128 feet; thence north 12° 30′ east, 105 feet; thence north 10° 0′ east, 125 feet; thence north 0° 0′ east, 110 feet; thence north 13° 0′ west, 90 feet; thence north 18° 30′ west, 66 feet; thence north 3° 0′ west, 130 feet; thence north 10° 0′ west, 125 feet; thence north 20° 30′ east, 78 feet; thence north 1° 0′ east, 52 feet; thence north 39° 0′ east, 47 feet; thence north 30° 0′ east, 64 feet; thence north 10° 30′ west, 90 feet; thence north 12° 30′ west, 190 feet; thence north 63° 0′ west, 112 feet; thence north 54° 0′ west, 70 feet; thence north 34° 0′ west, 72 feet; thence north 41° 0′ west, 73 feet; thence north 34° 0′ west, 90 feet; thence north 7° 0′ west, 115 feet; thence north 14° 0′ east, 105 feet; thence north 4° 30′ east, 94 feet; thence north 24° 0′ east, 120 feet; thence north 2° 30′ west, 400 feet; thence north 57° 30′ west, 125 feet; thence north 17° 0′ west, 80 feet; thence north 5° 30′ west, 110 feet; thence north 12° 30′ west, 78 feet; thence north 32° 0′ west, 90 feet; thence north 10° 0′ east, 300 feet; thence north 3° 30′ east, 340 feet; thence north 48° 0′ east, 135 feet; thence north 46° 0′ east, 148 feet; thence south 88° 30′ east, 100 feet to headgate of the Sand creek ditch. That the capacity [fol. 3071] of said Sand creek as above described for the carriage of water is more than 500 cubic feet per second of time, the same being a natural channel or waterway collecting and draining a large watershed and territory and being supplied chiefly by rains, floods, and melting snows, falling upon and coming into the said watershed; that the said Deadman creek and the sources of supply of the Deadman ditch, discharged as aforesaid, into said Sand creek, do not naturally discharge or come into the said Sand creek, but are turned in Sand creek, and proposed to be turned into Sand creek by means of the Deadman and Columbine ditches as aforesaid.

II.

That the description of reservoirs Nos. 2, 7, and 10, above mentioned, which reservoirs are supplied from said Deadman creek, from the waters of said Sand creek, is as follows, to-wit:

No. 10. Commencing at a point 1065 feet north, 15°, 0′ east, from the southwest corner of section 9, township 10 north, range 75 west; thence north 21°, 15′ west, 460 feet; thence south 65°, 0′ west, 255 feet; thence south 65°, 5′ west, 395 feet; thence south 57°, 35′ west, 488 feet; thence south 23°, 0′ west, 360 feet; thence south 33°, 25′ east, 245 feet; thence south 42°, 35′ east, 325 feet; thence south 70°, 25′ east, 290 feet; thence north 35°, 20′ east, 205 feet; thence north 9° 40′ east, 280 feet; thence north 30° 40′ east, 405 feet; thence north 57° 20′ east, 260 feet, to point of beginning, containing 22.90 acres, with a total storage capacity of 10,000,000 cubic feet of water.

No. 2. Commencing at a point 1345 feet north, 17° 30′ east, from the south ¼ corner of section 9, township 10 north, range 75 west; thence south 73° 30′ east, 420 feet; thence south 73° 30′ east, 478 feet; thence north 81° 30′ east, 254 feet; thence north 18° 28′ west, 365 feet; thence north 16° 0′ east, 108 feet; thence north 57° 28′ west, 108 [fol. 3072] feet; thence north 75° 50′ west, 280 feet; thence south 83° 35′ west, 295 feet; thence north 83° 55′ west, 265 feet; thence south 18° 10′ west, 374 feet; to point of beginning, containing 11.4 acres, with a total storage capacity of 6,500,000 cubic feet of water.

No. 7. Commencing at a point 167 feet north, 30° 0′ west, from the north ¼ corner of section 9, township 10 north, range 75 west and thence north 40° 0′ west, 648 feet; thence south 75° 10′ west, 315 feet; thence south 0° 30′ east, 430 feet; thence south 18° 28′ east, 665 feet; thence south 9° 45′ east, 180 feet; thence south 11° 15′ west, 282 feet; thence south 29° 30′ west, 248 feet; thence north 88° 25′ east, 250 feet; thence north 54° 15′ east, 200 feet; thence north 23° 0′ east, 265 feet; thence north 27° 30′ east, 140 feet; thence north 8° 15′ east, 190 feet; thence north 0° 40′ west, 142 feet; thence north 5° 45′ west, 120 feet; thence north 13° 45′ west, 145 feet; thence north 15° 20′ east, 215 feet; thence north 40° 7′ east 72 feet, to point of beginning, containing 21.90 acres, with a total storage capacity of 10,350,000 cubic feet of water.

III.

That The Divide Canal and Reservoir Company claims the right to appropriate all of said waters flowing in Sand creek for the filling of said reservoirs and for the use of the same

for irrigation in the watershed of the Cache la Poudre river, as aforesaid, and also claims the right to use and employ said channel above described for the carriage of said water as a part of its said Sand creek ditch system and to divert both the waters not only flowing in said Sand creek but as well the waters turned into the same and stored in said reservoirs above described, as aforesaid, through and by means of the Sand creek ditch herein described and to carry all of said waters from and through said Sand creek ditch over and across the divide into Sheep creek, and [fol. 3073] thence into the Cache la Poudre to be again diverted for storage in reservoirs and for irrigation in the valley of the Cache la Poudre river and within water district No. 3 of the state of Colorado. That the amount of water claimed is available for and required for the irrigation of upwards of 20,000 acres of land belonging to stockholders of claimant and others.

James W. McCreery, 7 and 9 Bank Block, Greeley, Colorado, Attorney for The Divide Canal and Reservoir Company.

STATE OF COLORADO,
County of Weld, ss:

Bruce G. Eaton, being first duly sworn deposes and says:

I am president of The Divide Canal and Reservoir Company, the claimant above named; I have read the above and foregoing amendment to statement of claim to priority heretofore filed herein by said company and know the contents thereof. The same is true to the best of my knowledge and belief.

Bruce G. Eaton.

Sworn to before me and subscribed in my presence by the said Bruce G. Eaton this 10th day of March, A. D. 1906.

My commission as notary public in and for Weld county, State of Colorado, will expire February 20, 1908.

Henry Clay Luther, Notary Public in and for the County of Weld and State of Colorado. (Seal.)

[fol. 3074] STATE OF COLORADO,
Larimer County, ss:

I, W. P. Hurley, Clerk of the District Court of Larimer County, in the State aforesaid, do hereby certify the above

and foregoing to be a true, perfect and complete copy of Amendment to Statement of Claim to Priority of The Divide Canal and Reservoir Company in a certain cause lately pending in said Court, entitled In the Matter of the Adjudication of Priorities of Right to the Use of Water in Water District No. 48, Division No. 1, of the State of Colorado, being Case No. 1885 in this Court.

In witness whereof I have hereunto set my hand and affixed the seal of said Court, at Fort Collins, Colorado, this 6th day of June, A. D. 1933.

W. P. Hurley, Clerk; by Gertrude Fritz, Deputy.

(Seal District Court, Larimer County, Colorado.)

FOLD-OUT IS TOO LARGE TO BE FILMED

[fol. 3077] DEFENDANT'S EXHIBIT N-1

This agreement made and entered into this fifth day of September, A. D. 1898, by and between Philipp Wilson of the County of Larimer and State of Colorado, party of the first part, and B. H. Eaton, of the County of Weld, in the state aforesaid, party of the second part,

Witnesseth, that said first party, for and in consideration of the payment to him of the sum of fifteen hundred dollars by said second party, in manner hereinafter set forth, hereby sells, transfers, conveys and assigns unto said *said* B. H. Eaton, his heirs and assigns, an entire undivided two thirds interest in and to that certain appropriation of water from the Deadman creek and Sand Creek in said Larimer County which is particularly set forth and described in a plat and statement filed in the office of the Clerk and Recorder of Larimer County, Colorado, on the 22" day of July, A. D. 1897, and numbered by the file number of said office and named the Wilson Supply Ditch.

And said B. H. Eaton, second party above named, for himself, his heirs, administrators and assigns, in consideration of the premises, agrees to pay to said Philipp Wilson, first party above named, the full sum of fifteen hundred dollars, in manner following, towit: Five hundred dollars thirty days after the ensealing of these presents, without interest; and one thousand dollars one year after the date of these presents, with interest at the rate of six per cent. per annum from this date until paid.

It is understood and agreed by the parties hereto that any payment by said Eaton on this agreement shall be forfeit to said Wilson in case of the failure by said Eaton to complete the payment of the full amount agreed upon, and the title to the said property shall not vest in said Eaton, until the full sum of fifteen hundred dollars shall have been [fol. 3078] paid to the said Wilson, his heirs or assigns.

And it is further agreed by and between the parties hereto that the sum of fifty dollars already paid by said Eaton to said Wilson is intended as a forfeit only, in case of the failure by said Eaton to consummate the purchase as above provided, and it is not in any event to be considered as a part of the fifteen hundred dollars purchase money hereinbefore named.

In witness whereof the parties hereto have signed their names to this writing, drawn in duplicate, the day and year first above written.

Philip Wilson, B. H. Eaton.

Fort Collins, Colo., Oct. 8, 1898.

B. H. Eaton has this day paid to Philip Wilson on this contract Five hundred dollars in my presence.

R. Q. Tenney.

[fol. 3079] [Endorsed:] Agreement. B. H. Eaton and Philip Wilson. Sale of ⅔ interest. Wilson Supply Ditch.

(Here follows photolithograph of map, Defendant's Exhibit O-1, side folio 3080)

FOLD-OUT IS TOO LARGE TO BE FILMED

[fol. 3081] DEFENDANT'S EXHIBIT P-1

This Deed, made this 30th day of November, in the year of our Lord one thousand nine hundred and one, between Philip Wilson of the County of Larimer and State of Colorado, of the first part, and the Divide Ditch Company, a corporation, doing business under and by virtue of the laws of Colorado, of the County of — and State of Colorado, of the second part:

Witnesseth: That the said party of the first part, for and in consideration of the sum of One Dollar and other valuable considerations, to the said party of the first part in hand paid by the said party of the second part, the receipt whereof is hereby confessed and acknowledged, has remised, released, sold, conveyed and quit claimed, and by these presents does remise, release, sell, convey and quit claim unto the said party of the second part, its successors and assigns forever, all the right, title, interest, claim and demand which the said party of the first part has in and to the following described property situate, lying and being in the County of Larimer and State of Colorado, to-wit: All of the rights, privileges and franchises of and in that certain claim and appropriation of water known as the Wilson Supply Ditch, statement for which was filed in the office of the Clerk of said Larimer County on the 22nd day of July, 1897, and in said statement described as follows, to wit: The Wilson Supply Ditch having headgate at a point on Deadman Creek which bears due north from the southeast corner of Sec. 15 in township 10 north of range 75 west in said Larimer County, 750 feet and having gate discharging water into Sand Creek at a point on the south bank thereof which bears due north from the quarter corner on the south side of Sec. 9 in township 10 north of range 75 west in said Larimer County 1480 feet, at which point said Sand Creek assumes a well defined channel; said ditch thence following the bed of Sand Creek to a point which bears south 53° west from the quarter corner on the west side of Sec. 23 in township 11 north of range 75 west in said Larimer County 370 feet, at which period is located a headgate by which the water hereby appropriated is diverted from said Sand Creek, it being the intention hereby to appropriate all the water from Deadman Creek which naturally finds its way into the

ditch herein described and the water from the streams, valleys and natural depressions intersected by said ditch and lying above the source and all water of Sand Creek which now reaches the headgate last above described, not heretofore appropriated, it being also the intention hereby to divert the water herein appropriated from the water-shed of the Big Laramie River into the water-shed of the Cache la Poudre River.

To have and to hold the same, together with all and singular the appurtenances and privileges thereunto belonging, or in anywise thereunto appertaining, and all the estate, right, title, interest and claim whatsoever, of the said party of the first part, either in law or equity, to the only proper use, benefit and behoof of the said party of the second part, his heirs and assigns forever.

In witness whereof, the said party of the first part has hereunto set his hand and seal the day and year first above written.

Philip Wilson, (Seal.)

[fol. 3081a] STATE OF COLORADO,
County of Larimer, ss:

I, Charles F. Davis, Notary Public in and for said County, in the State aforesaid, do hereby certify that Philip Wilson, who is personally known to me to be the person whose name is subscribed to the foregoing deed, appeared before me this day in person, and acknowledged that he signed, sealed and delivered the said instrument of writing as his free and voluntary act, for the uses and purposes therein set forth.

Given under my hand and notarial seal, this 30th day of November, A. D. 1901.

[fol. 3083] DEFENDANT'S EXHIBIT Q-1

This deed, made this 2 day of December, in the year of our Lord one thousand nine hundred and one, between Rollin Q. Tenney, of the County of Larimer and State of Colorado, of the first part, and The Divide Ditch Company, a corporation, of the County of —— and State of Colorado, of the second part:

Witnesseth: That the said party of the first part, for and in consideration of the sum of One Dollar and other valuable considerations, to the said party of the first part in hand paid by the said party of the second part, the re-

ceipt whereof is hereby confessed and acknowledged, has remised, released, sold, conveyed and quit claimed, and by these presents does remise, release, sell, convey and quit claim unto the said party of the second part *his* its successors and assigns forever, all the right, title, interest, claim and demand which the said party of the first part has in and to the following described property situate, lying and being in the County of Larimer and State of Colorado, to-wit: All of the rights, privileges and franchises of and in that certain claim and appropriation of water known as the Wilson Supply Ditch, statement for which was filed in the office of the Clerk of said Larimer County on the 22nd day of July, 1897, and in said statement described as follows, to-wit: The Wilson Supply Ditch, having headgate at a point on Deadman Creek which bears due north from the southeast corner of section 15 in township 10 north, of range 75 west, in said Larimer county, 750 feet, and having gate discharging water into Sand Creek at a point on the south bank thereof which bears due north from the quarter corner on the south side of sec. 9 in township 10 north, of range 75 west, in said Larimer county, 1480 feet, at which point said Sand Creek assumes a well defined channel; said ditch thence following the bed of Sand Creek to a point which bears south 53° west from the quarter corner on the west side of sec. 23, in township 11 north, of range 75 west, in said Larimer county, 370 feet, at which point is located a headgate by which the water hereby appropriated is diverted from said Sand Creek. It being the intention hereby to appropriate all of the water from Deadman Creek which naturally finds its way into the ditch herein described, and the water from the streams, valleys and natural depressions intersected by said ditch and lying above the same, and all water of Sand Creek which now reaches the headgate last above described, not heretofore appropriated. It being also the intention to divert the water herein appropriated from the water shed of the Big Laramie River into the watershed of the Cache la Poudre River.

To have and to hold, the same, together with all and singular the appurtenances and privileges thereunto belonging or in anywise thereunto appertaining, and all the estate, right, title, interest and claim whatsoever, of the said party of the first part, either in law or equity, to the only proper

use, benefit and behoof of the said party of the second part, its successors and assigns forever.

In witness whereof the said party of the first part has hereunto set his hand and seal the day and year first above written.

Rollin Q. Tenney. (Seal.)

[fol. 3085] DEFENDANT'S EXHIBIT R-1

This deed, made this first day of May, in the year of our Lord one thousand nine hundred and two, between Rollin Q. Tenney of the County of Larimer and State of Colorado, of the first part, and Benjamin H. Eaton, of the County of Weld and State of Colorado, of the second part:

Witnesseth: That the said party of the first part, for and in consideration of the sum of Nine hundred and fifty Dollars, to the said party of the first part in hand paid by the said party of the second part, the receipt whereof is hereby confessed and acknowledged, has remised, released, sold, conveyed and quit claimed, and by these presents does remise, release, sell, convey and quit claim unto the said party of the second part, his heirs and assigns forever, all the right, title, interest, claim and demand which the said party of the first part has in and to the following described property situate, lying and being in the County of Larimer and State of Colorado, to-wit: For the right of way for that certain ditch known as the Columbine Ditch, located in Section twenty-six in Tp. 10 N. R. 75 West, with all rights to the appropriation of water and any and all interests therein.

To have and to hold the same, together with all and singular the appurtenances and privileges thereunto belonging, or in anywise thereunto appertaining, and all the estate, right, title, interest and claim whatsoever, of the said party of the first part, either in law or equity, to the only proper use, benefit and behoof of the said party of the second part, his heirs and assigns forever.

In witness whereof the said party of the first part has hereunto set his hand and seal the day and year first above written.

Rollin Q. Tenney. (Seal.)

[fol. 3089] DEFENDANT'S EXHIBIT U-1

This deed, made this 15th day of February, in the year of our Lord one thousand nine hundred and four, between The Divide Ditch Co., a Corporation doing business in the Counties of Weld and Larimer, in the State of Colorado, of the first part, and The Divide Canal and Reservoir Company, a Corporation duly organized, existing and doing business in the County of Larimer and State of Colorado of the second part:

Witnesseth, that the said party of the first part, for and in consideration of the sum of One Dollar, and other valuable considerations, to it in hand paid by the party of the second part the receipt whereof is hereby confessed and acknowledged, has remised, released, sold, conveyed and quit-claimed, and by these presents does remise, release, sell, convey and quit-claim unto the said party of the second part, its successors and assigns, forever, all the right, title, interest, claim and demand which the said party of the first part has in and to the following described real estate situate, lying and being in the County of Larimer and State of Colorado, to-wit:

The following irrigation supply ditches and rights of way and appropriations thereof, taken from Deadman Creek and its branches, a tributary of the Laramie River in Larimer County, Colorado, to-wit:

The Columbine Ditch, commencing at a point on a branch of Deadman Creek about five hundred feet west of the center of Sec. 35, Tp. 10 N. R. 75 W. Thence in a Northeasterly direction, crossing another branch of said Creek and taking [fol. 1390] the water therefrom, to a point about two hundred feet east of the South ¼ corner of Sec. 26, said Tp. and Range. Thence in a Northeasterly direction to a branch of the North Fork of the Cache la Poudre River, where water is to be discharged to be carried down said Cache la Poudre River and its branches to the place of diversion; said ditch will also be extended, from, at or near said S. ¼ corner of said Sec. 26 in a Northerly direction through sections 26, 23 and 22 in said Tp. and Range, to head of Deadman Ditch at the main branch of Deadman Creek at a point 750 feet North of the South east corner of Sec. 15,

Tp. 10 N. R. 75 W. where the said Columbine Ditch discharges water into the said Deadman Ditch.

Also Deadman Ditch, also known as the Wilson Supply Ditch, and the right of way there for which is to divert water from several branches of said Deadman Creek, and extends in a Northeasterly direction from the point last mentioned through Secs. 15, 16 and 9 in Tp. 10 N. R. 75 W. being described as follows:

Commencing at the bank of Deadman Creek at a point 750 feet North of the S. E. Corner of Sec. 15 Tp. 10 N. R. 75 W. running, thence, South 65 degrees West 1,000 feet; thence North 81 degrees West 850 feet; thence South 73 degrees West 890 feet; thence North 28 degrees east 760 feet; thence North 16 degrees 30′ 900 feet; thence North 72 degrees west 1,280 feet; thence North 56 degrees 30′ west 1,150 feet; thence North 50 degrees west 1,200 feet; thence North 35 degrees west 1,550 feet; thence N. 30 degrees east 565 feet; thence North 5 degrees east 700 feet; thence North 75 degrees 30′ west 1,000 feet; thence North 69 degrees 30′ west 900 feet to a point where Sand Creek shows a well defined channel. Thence following said Sand Creek through sections 9 and 4 Tp. 10 N. R. 75 W. and through sections 33, 34, 27 and 22 Tp. 11 N. R. 75 W. where the Divide Ditch, so called, is taken from said Sand Creek, to divert the waters therefrom derrived as aforesaid.

Also the said Divide Ditch and the right of way and appropriations the same being a ditch to divert water from [fol. 3091] Sand Creek derrived from the Columbine and Deadman ditches, and otherwise, over and accross the divide between Sand Creek and Sheep Creek a tributary of the Cache la Poudre River, said ditch being described as follows:

Commencing at a point 240 feet south 22 degrees 30′ west to the ¼ corner on the east side of Sec. 22, thence S. 87 degrees E. 391 feet North 45 degrees E. 1100 feet; North 74 degrees 30′ east 390 feet; S. 84 degrees E. 600 feet; N. 58 degrees E. 650 feet to point of discharge into Sheep Creek, a tributary of the Cache la Poudre River through which said waters, diverted as aforesaid, are to be carried into the Cache la Poudre River and carried, thence to the proposed place of diversion from the Cache la Poudre River; to be used for the filling of reservoirs and for the direct irrigation of lands.

Also several storage reservoirs are to be constructed along Sand Creek aforesaid, in sections 9 and 4, Tp. 10 N. R. 75 W. and in section 33 and 4 in Tp. 11, N. R. 75 W. and at other places.

That all of said waters derived and appropriated from the tributaries of the Laramie River and from the Cache la Poudre River and its tributaries are to be diverted from said river at the head of and carried through the ditch of The North Poudre Irrigation Company, the ditch of The Poudre Valley Irrigation Company and the ditch of the Larimer and Weld Irrigation Company, respectively.

To have and to hold the same, together with all and singular the appurtenances and privileges thereunto belonging or in anywise appertaining, and all the estate, right, title, interest and claim whatsoever of the said party of the first part, either in law or equity, to the only proper use, benefit and behoof of the said party of the second part, its successors and assigns, forever.

In witness whereof, the said party of the first part has caused these presents to be signed by its president, attested by its secretary and affixed its corporate seal hereto the [fols. 3092 & 3093] day and year first above written.

The Divide Ditch Company. By Bruce G. Eaton, President. (Seal.) Attest: Ellis Smith, Secretary.

State of Colorado,
County of Weld, ss:

I, Frederick L. Weller, a Notary Public in and for the above named county, in the state aforesaid, do hereby certify that Bruce G. Eaton, president of The Divide Ditch Company, personally known to me to be the person whose name is subscribed to the foregoing Deed appeared before me this day in person and acknowledged that he signed, sealed and delivered the said instrument of writing as his free and voluntary act, and the free and voluntary act of the above named corporation for the uses and purposes therein set forth.

Given under my hand and Notarial seal this 16th day of February, A. D. 1804.

Frederick L. Weller, Notary Public. (Seal.)

My commission expires February 12th, 1906.

[fol. 3094] [Endorsed:] 82324. Quit-claim deed from the Divide Ditch Company to the Divide Canal & Reservoir Co.

STATE OF COLORADO,
County of Larimer, ss:

I hereby certify that this instrument was filed for record at 1:35 o'clock P. M. Feb. 18, 1904, in my office, and duly recorded in book 181, page No. 112.

J. E. Ramer, County Recorder. By F. J. Burnett, Deputy Recorder.

Fees $1.75 Pd., B. H. Eaton, P. O. Box 159, Eaton, Colo.

[fol. 3097] DEFENDANT'S EXHIBIT X-1

Warranty Deed

This Indenture, made this third day of February, in the year of our Lord one thousand nine hundred and six, between Peter Cunningham and Minerva Cunningham, his wife, of the County of Albany, and State of Wyoming, of the first part, and James M. Hoge, of the County of Albany, and State of Wyoming, of the second part:

Witnesseth: That the said parties of the first part, for and in consideration of the sum of Seven Thousand Dollars, to the said parties of the first part in hand paid by the said party of the second part, the receipt whereof is hereby confessed and acknowledged, have granted, bargained, sold and conveyed, and by these presents do grant, bargain, sell, convey and confirm unto the said party of the second part, his heirs and assigns forever, all the following described lots or parcels of land, situate, lying and being in the County of Albany, and State of Wyoming, to-wit:

All of Section Twenty-six (26) and the northeast quarter of Section Twenty-four (24); Township fourteen (14), Range Seventy-five (75); together with all the improvements and appurtenances, including among other things all fences, water rights and ditches situated upon or used in connection with said lands or any of them; also all the right, title and interest in and to the certain irrigation ditch known as the Le Roy Ditch, hereby waiving and releasing any and all rights under and by virtue of the homestead exemption laws of the State of Wyoming.

To have and to hold the same, together with all and singular the appurtenances and privileges thereunto belonging, or in anywise thereunto appertaining, including the release and waiver of the right of homestead, and all the estate, right, title, interest and claim whatsoever of the said parties of the first part, either in law or equity, to the only proper use, benefit and behoof of the said party of the second part, his heirs, and assigns forever.

And the said parties of the first part, for themselves, their heirs, executors and administrators, do covenant and agree to and with the said party of the second part, his heirs and assigns, that at the ensealing and delivery of these presents

they are well seized of the said granted premises, in and of a good and indefeasible estate in fee simple.

And that they have good and lawful right to sell and convey the same, and that they will warrant and defend the same against all lawful claims and demands whatsoever.

And for the consideration aforesaid, I, the said Minerva Cunningham, wife of the said Peter Cunningham, do hereby relinquish and release unto the said party of the second part, his heirs and assigns forever, all my rights, and including the release and waiver of the right of homestead, and all of my rights whatsoever, of, in and to the aforegranted premises.

In witness whereof, the said parties of the first part have hereunto set their hands and seals the day and year first above written.

Peter Cunningham (Seal.) Minerva Cunningham (Seal.)

Signed, sealed and delivered in presence of Will McMurray.

THE STATE OF WYOMING,
County of Albany, ss:

I, R. G. Fitch, a Notary Public in and for the said County, in the State aforesaid, do hereby certify that Peter Cunningham and Minerva Cunningham, his wife, personally known to me to be the same persons whose names are subscribed to the foregoing instrument, appeared before me this day in person, and acknowledged that they signed, sealed and delivered the said instrument as their free and voluntary act, for the uses and purposes therein set forth, including the release and waiver of all rights of homestead in and to the property therein described.

And I further certify that Minerva Cunningham, wife of the said Peter Cunningham, while separate and apart from her said husband, was by me fully apprised of her right and the effect of signing and acknowledging said instrument, the contents and nature of which were explained to her by me, and thereupon, while so separate and apart from her said husband, and out of his hearing, she signed and acknowledged said instrument, and acknowledged to me that she released and waived her right of homestead in and to said property, and also signed and acknowledged said in-

strument freely and voluntarily, for the uses and purposes therein set forth.

My commission expires Sept. 20, 1906.

Given under my hand and notarial seal this 6th day of February, A. D. 1906.

[fol. 3098] DEFENDANT'S EXHIBIT Y-1

Warranty Deed.

This indenture, made this third day of February, in the year of our Lord one thousand nine hundred and six, between James M. Hoge, of the County of Albany, and State of Wyoming, of the first part, and Bruce G. Eaton, of the County of Weld, and State of Colorado, of the second part:

Witnesseth: That the said party of the first part, for and in consideration of the sum of seven thousand dollars, to the said party of the first part in hand paid by the said party of the second part, the receipt whereof is hereby confessed and acknowledged, has granted, bargained, sold and conveyed, and by these presents does grant, bargain, sell, convey and confirm unto the said party of the second part,

his heirs and assigns forever, all the following described lots or parcels of land, situate, lying and being in the County of Albany, and State of Wyoming, to-wit:

All of Section twenty six (26) and the northeast quarter of Section twenty four (24) in township fourteen (14) north, of range seventy five (75) west.

Together with all the improvements and appurtenances including, among other things, all fences, water rights and ditches situated upon or used in connection with said lands or any of them, also all the right title and interest of the party of the first part in and to the certain irrigating ditch known as the LeRoy Ditch.

To have and to hold the same, together with all and singular the appur-enances and privileges thereunto belonging, or in anywise thereunto appertaining, including the release and waiver of the right of homestead, and all the estate, right, title, interest and claim whatsoever of the said party of the first part, either in law or equity, to the only proper use, benefit and behoof of the said party of the second part, his heirs and assigns forever.

And the said party of the first part, for himself, his heirs, executors and administrators, doth covenant and agree, to and with the said party of the second part, his heirs and assigns, that he will warrant and defend the same against all lawful claims and demands whatsoever of all persons claiming or to claim the same by, through or under the party of the first part.

In witness whereof the said party of the first part has hereunto set his hand and seal the day and year first above written.

James M. Hoge. (Seal.)

Signed, sealed and delivered in presence of N. E. Corthell.

THE STATE OF WYOMING,
County of Albany, ss:

I, Nellis Corthell, a Notary Public in and for the said County, in the State aforesaid, do hereby certify that James M. Hoge, who is personally known to me to be the same person whose name is subscribed to the foregoing instrument, appeared before me this day in person, and acknowledged that he signed, sealed and delivered the said instrument as his free and voluntary act, for the uses and purposes

therein set forth, including the release and waiver of his rights of homestead in and to the property therein described.

Given under my hand and notarial seal this 4th day of April, A. D. 1906.

Nellis Corthell, Notary Public. (Seal.)

My commission expires Nov. 13, 1907.

[fol. 3099] DEFENDANT'S EXHIBIT Z-1

Warranty Deed

This indenture, made this thirtieth day of March, in the year of our Lord one thousand nine hundred and six, between James Hardman and Alice Hardman, his wife, of the County of Albany, and State of Wyoming, of the first part and Bruce G. Eaton, of the County of Weld, and State of Colorado, of the second part:

Witnessth: That the said parties of the first part, for and in consideration of the sum of eight thousand five hundred dollars, to the said parties of the first part in hand paid by the said party of the second part, the receipt whereof is hereby confessed and acknowledged, have

granted, bargained, sold and conveyed, and by these presents do grant, bargain, sell, convey and confirm unto the said party of the second part, his heirs and assigns forever, all the following described lots or parcels of land, situate, lying and being in the County of Albany, and State of Wyoming, to-wit:

The West half; and the West half of the East half of Section two (2); and all that portion of the North half of Section Eleven (11) bounded and described as follows: Beginning at a point in the County road, 3.14 chains west of the North East corner of said Section 11, and running thence along said road, South, 54° 30′ West. 36.40 chains; thence, along said county road, South 68° 30′ West, 15.56 chains; thence, along said county road, North, 62° West, 4.80 chains; thence, North 22° East, 7.95 chains, to a point of the west side of Sand Creek; thence, North 88° West, 30.60 chains, to a point on the west line of said Section 11; thence north, on the west line of said Section 11, 17.10 chains, to the northwest corner thereof; thence South 89° 30′ East, on the north line of said Section 11, 76.86 chains, to the place of beginning, subject to the right reserved in the deed of said James and Emma King for said lands in Section 11, in case Sand Creek should change its channel by washing or otherwise, so that said Kings or their heirs should be deprived of sufficient water within the boundaries of the lands reserved by said Kings in said Section 11, to have egress and ingress to said Sand Creek, within the boundaries of the land above described in Section 11 for the purpose of watering all stock of said Kings, in which event said Kings are to pay for a lane leading to Sand Creek, at the same price per acre that was paid by said Alice Hardman to the said Kings for the lands above described in said Section 11.

All of said lands situate lying and being in Township thirteen (13) north, of range seventy-five (75) west of the Sixth Principal Meridian.

Also, all buildings and improvements situated upon said lands and all water rights connected with the same or with the general ranch premises of the parties of the first part, also all fencing and enclosures connected with said general ranch premises, and including among other things the following ditches and the water rights belonging to the same, towit: the James Hardman No. 2 Ditch, the James Hard-

man No. 1 Ditch, the undivided interests of James and Alice Hardman in the Davis Brothers No. 1 Ditch and in the Davis Brothers No. 2 Ditch. Hereby releasing and waiving any and all rights under and by virtue of the homestead exemption laws of the State of Wyoming.

To have and to hold the same, together with all and singular the appurtenances and privileges thereunto belonging, or in anywise thereunto appertaining, including the release and waiver of the right of homestead, and all the estate, right, title, interest and claim whatsoever of the said parties of the first part, either in law or equity, to the only proper use, benefit and behoof of the said party of the second part, his heirs and assigns forever.

And the said parties of the first part, for themselves, their heirs, executors and administrators, do covenant and agree, to and with the said party of the second part, his heirs and assigns, that at the ensealing and delivery of these presents they are well seized of the said granted premises, in and of a good and indefeasible estate in fee simple.

And that they have good and lawful right to sell and convey the same, and that they will warrant and defend the same against all lawful claims and demands whatsoever.

And for the consideration aforesaid, I, the said Alice Hardman, wife of the said James Hardman, do hereby relinquish and release unto the said party of the second part, his heirs and assigns forever, all my rights, and including the release and waiver of the right of Homestead, and all of my rights whatsoever, of, in and to the aforegranted premises.

In witness whereof the said parties of the first part have hereunto set their hands and seals the day and year first above written.

James Hardman. (Seal.) Alice Hardman. (Seal.)

Signed, sealed and delivered in presence of
N. E. Corthell.

The State of Wyoming,
County of Albany, ss:

I, Nellis Corthell, a Notary Public in and for the said County, in the State aforesaid, do hereby certify that

James Hardman and Alice Hardman, who are personally known to me to be the same persons whose names are subscribed to the foregoing instrument, appeared before me this day in person, and acknowledged that they signed, sealed and delivered the said instrument as their free and voluntary act, for the uses and purposes therein set forth, including the release and waiver of their rights of homestead in and to the property therein described.

And I further certify that Alice Hardman, wife of the said James Hardman, while separate and apart from her said husband, was by me fully apprised of her right and the effect of signing and acknowledging said instrument, the contents and nature of which were explained to her by me, and thereupon, while so separate and apart from her said husband, and out of his hearing, she signed and acknowledged said instrument, and acknowledged to me that she released and waived her right of homestead in and to said property, and also signed and acknowledged said instrument freely and voluntarily, for the uses and purposes therein set forth.

Given under my hand and notarial seal this 24 day of April, A. D. 1906.

Nellis Corthell, Notary Public. (Seal.)

My commission expires Nov. 13, 1907.

[fol. 3100] DEFENDANT'S EXHIBIT A-2

Warranty Deed

This indenture, made this twenty-fourth day of November, in the year of our Lord one thousand nine hundred and six, between Bruce G. Eaton of the County of Weld, and State of Colorado, of the first part, and Lemuel E. Cook, of the County of Albany, and State of Wyoming, of the second part:

Witnesseth: That the said party of the first part, for and in consideration of the sum of One Thousand Dollars to the said party of the first part in hand paid by the said party of the second part, the receipt whereof is hereby confessed and acknowledged, has granted, bargained, sold and conveyed, and by these presents does grant, bargain, sell, convey and confirm unto the said party of the second part, his heirs and assigns forever all the following described lot or parcel of land, situate, lying and being in the County of Albany, and State of Wyoming, to-wit:

The northeast quarter of Section Twenty-four (24) in Township Fourteen (14) North, of Range Seventy-five (75) of the Sixth Principal Meridian. Together with all the improvements and appurtenances. Excepting and reserving, however, unto the party of the first part, his heirs and assigns, any and all water rights belonging to the party of the first part and heretofore connected with said lands or any part thereof.

[fol. 3101] To have and to hold the same, together with all and singular the appurtenances and privileges thereunto belonging, or in anywise thereunto appertaining, including the release and waiver of the right of homestead, and all the estate, right, title, interest and claim whatsoever of the said party of the first part, either in law or equity, to the only proper use, benefit and behoof of the said party of the second part, his heirs and assigns forever.

And the said party of the first party, for himself, his heirs, executors, and administrators, does covenant and agree, to and with the said party of the second part, his heirs and assigns, that at the ensealing and delivery of these presents he is well seized of the said granted premises, in and of a good and indefeasible estate in fee simple.

And that he has good and lawful right to sell and convey the same, and that he will warrant and defend the same against all lawful claims and demands whatsoever.

In witness whereof the said party of the first part has hereunto set his hand and seal the day and year first above written.

Bruce G. Eaton. (Seal.)

Signed, sealed and delivered in presence of C. J. Stockfleth.

[fol. 3102] THE STATE OF COLORADO,
County of Weld, ss:

I, Clarence W. Candlin, a Notary Public in and for the said County, in the State aforesaid, do hereby certify that Bruce G. Eaton, who is personally known to me to be the same person whose name he subscribed to the foregoing instrument appeared before me this day in person, and acknowledged that *is* signed, sealed and delivered the said instrument as his free and voluntary act and deed, for the uses and purposes therein set forth, including the release and waiver of his rights of homestead in and to the property therein described.

And I further certify that wife of the said —— ——, while separate and apart from her said husband, was by me fully apprised of her right and the effect of signing and acknowledging said instrument, the contents and nature of which were explained to her by me, and thereupon, while so separate and apart from her said husband, and out of his hearing, she signed and acknowledged said instrument, and acknowledged to me that she released and waived her right of homestead in and to said property, and also signed and acknowledged said instrument freely and voluntarily, for the uses and purposes therein set forth.

Given under my hand and notarial seal this 6th day of December, A. D. 1906.

Clarence W. Candlin, Notary Public. (Notarial Seal.)

My commission expires March 11, 1909.

[fol. 3105] DEFENDANT'S EXHIBIT B-2

Warranty Deed

This indenture, made this twentieth day of December, in the year of our Lord one thousand nine hundred and seven, between Bruce G. Eaton and Mary H. Eaton, his wife, of the County of Weld, and State of Colorado of the first part, and Franklin P. Mason, of the County of Albany, and State of Wyoming of the second part:

Witnesseth: That the said parties of the first part, for and in consideration of the sum of Four Thousand Dollars, to the said parties of the first part in hand paid by the said party of the second part, the receipt whereof is hereby confessed and acknowledged, have granted, bargained, sold

and conveyed, and by these presents do grant, bargain, sell, convey and confirm unto the said party of the second part, his heirs and assigns forever, all the following described lots or parcels of land, situate, lying and being in the County of Albany, and State of Wyoming, to-wit:

The west half, and the west half of the east half of Section Two (2), and all that portion of the north half of Section Eleven (11) bounded and described as follows: Beginning at a point in the County Road 3.14 chains west of the northeast corner of said section eleven (11) and running thence along said road south 54° 30′ west 36.40 chains; thence along said county road south 68° 30′ west 15.56 chains; thence along said county road north 62° west 4.80 chains; thence north 22° east 7.95 chains to a point on the west side of Sand Creek; thence north 88° west 30.60 chains to a point on the west line of said Section Eleven (11); thence north on the west line of said Section Eleven 17.10 chains to the northwest corner thereof; thence south 89° 30′ east on the north line of said Section Eleven (11) 76.86 chains to the place of beginning. Subject to the right reserved in deed of James and Emma King for said lands in said Section Eleven (11) in case said creek should change its channel by washing or otherwise, so that said Kings or their heirs or assigns should be deprived of sufficient water within the boundaries of the lands reserved by said Kings in said Section Eleven (11) to have egress and ingress to said Sand Creek within the boundaries of the land above described in Section Eleven (11) for the purpose of watering all the stock of said Kings, in which event said Kings [fol. 3106] are to pay for lane leading to Sand Creek at the same price per acre that was heretofore paid by Alice Hardman to the said Kings for the lands above described in said Section Eleven (11). All of said lands situate, lying and being in Township Thirteen (13) North of Range Seventy-five West of the Sixth Principal Meridian. Together with all improvements and appurtenances, including all water rights from Spring Creek, but reserving unto the parties of the first part, their heirs and assigns, any and all other water rights belonging to the parties of the first part heretofore connected with said lands or any part thereof. Hereby waiving and releasing any and all rights under and by virtue of the homestead exemption laws of this State of Wyoming.

To have and to hold the same, together with all and singular the appurtenances and privileges thereunto belonging, or in anywise thereunto appertaining, including the release and waiver of the right of homestead, and all the estate, right, title, interest and claim whatsoever of the said party of the first part, either in law or equity, to the only proper use, benefit and behoof of the said party of the second part, his heirs and assigns forever.

And the said party of the first part, for themselves, their heirs, executors, and administrators, do covenant and agree, to and with the said party of the second part, his heirs and assigns, that at the ensealing and delivery of these presents they are well seized of the said granted premises, in and of a good and indefeasible estate in fee simple.

And that they have good and lawful right to sell and convey the same, and that they will warrant and defend the same against all lawful claims and demands whatsoever.

And for the consideration aforesaid, I, the said Mary H. Eaton, wife of the said Bruce G. Eaton, do hereby relinquish and release unto the said party of the second part, and assigns forever, all my Rights, and including the release and waiver of the right of Homestead, and all of my rights whatsoever, of, in and to the aforegranted premises.

In Witness Whereof, The said parties of the first part have hereunto set their hands and seals the day and year first above written.

Bruce G. Eaton. (Seal.) Mary H. Eaton. (Seal.)

Signed, sealed and delivered in presence of C. M. Stockover, A. J. Allen.

[fol. 3107] The State of Colorado,
County of Weld, ss:

I, —— ——, a Notary Public in and for the said County, in the State aforesaid, do hereby certify that Bruce G. Eaton and Mary H. Eaton, his wife, who are personally known to me to be the same persons whose names are subscribed to the foregoing instrument appeared before me this day in person, and acknowledged that they signed, sealed and delivered the said instrument as their free and voluntary act and deed, for the uses and purposes therein set forth, including the release and waiver of all rights of homestead in and to the property therein described.

And I further certify that Mary H. Eaton, wife of the said Bruce G. [fol. 3110] DEFENDANT'S EXHIBIT C-2

Warranty Deed

This indenture, made this tenth day of April, in the year of our Lord one Thousand nine hundred and seven, between Bruce G. Eaton, of the County of Weld, and State of Colorado of the first part, and James M. Hoge, of the County of Albany, and State of Wyoming of the second part:

Witnesseth: That the said party of the first part, for and in consideration of the sum of ($2560.00) Twenty-five hundred sixty & 00/100 Dollars, to the said party of the first part in hand paid by the said party of the second part, the receipt whereof is hereby confessed and acknowledged, has granted, bargained, sold and conveyed, and by these presents does grant, bargain, sell, convey and confirm unto the said party of the second part, his heirs and assigns forever all the following described lots or parcels of land, situate, lying and being in the County of Albany, and State of Wyoming, to-wit:

All of Section Twenty-six (26) in Township Fourteen (14) North of Range Seventy-five (75) West of the Sixth Principal Meridian. Together with all the improvements and appurtenances including, among other things, all fences and ditches situated upon or used in connection with said lands, or any of them, and especially all the right, title and interest of the party of the first part in and to the certain irrigating ditch known as the LeRoy Ditch. Excepting and reserving, however, unto the party of the first part, his heirs, and assigns, any and all water rights belonging to

the party of the first part and heretofore connected with said lands or any part thereof.

[fol. 3111] To have and to hold the same, together with all and singular the appurtenances and privileges thereunto belonging, or in in anywise thereunto appertaining, including the release and waiver of the right of homestead, and all the estate, right, title, interest and claim whatsoever of the said party of the first part, either in law or equity, to the only proper use, benefit and behoof of the said party of the second part, his heirs and assigns forever.

And the said party of the first part, for himself, his heirs, executors, and administrators, doth covenant and agree, to and with the said party of the second part, his heirs and assigns, that at the ensealing and delivery of these presents he is well seized of the said granted premises, in and of a good and indefeasible estate in fee simple.

And that he has good and lawful right to sell and convey the same, and that he will warrant and defend the same against all lawful claims and demands whatsoever, save only the taxes for 1907 which the party of the second part assumes and agrees to pay.

In witness whereof the said party of the first part has hereunto set his hand and seal the day and year first above written.

Bruce G. Eaton, (Seal.)

Signed, sealed and delivered in presence of Clarence W. Candlin.

[fol. 3115] DEFENDANT'S EXHIBIT D-2

Deed

This Indenture, made this second day of January, A. D. 1920, by and between Bruce G. Eaton and Martha L. Eaton, his wife, of the first part, and The Divide Canal and Reservoir Company, a corporation, of the second part, all of Weld county, State of Colorado;

Witnesseth: That the said parties of the first part for and in consideration of the sum of one dollar and other good and valuable considerations, to them in hand paid, by the said party of the second part, the receipt whereof is hereby confessed and acknowledged, have granted, bargained, sold and conveyed, and by these presents do grant, bargain, sell, convey and confirm, unto the said party of the second part, its successors and assigns, forever, all the following described ditches and interests in ditches, and water rights and appropriations of water pertaining thereto, situate, lying, and being in the county of Albany, in the state of Wyoming, to-wit:

All the right, title and interest of the parties of the first part in and to the following irrigation ditches, taking waters out of Sand Creek and its tributaries, in the said county, and also in the appropriations of water therefor, as follows, viz:

The interests of first parties in and to that certain irrigation ditch known as the Le Roy Ditch and the appropriations of water allowed and decreed thereto, under the name of Peter Cunningham, as of the date of May, 1885, in the amount of 8.65 cubic feet of water per second of time, and which by mesne conveyances, has vested in parties of the first part.

Also the interests of the parties of the first part in and to that certain irrigation ditch known as The James Hard-
[fol. 3116] man No. 2 Ditch and the appropriations of water allowed and decreed thereto under the name of James Hardman as of the date of May, 1878, in the amount of 1.81 cubic feet of water, per second of time, and which by mesne conveyances has vested in the parties of the first part.

Also the interests of the parties of the first part in and to that certain irrigation ditch known as Davis Brothers No. 2 and Alice Hardman Ditch, and its Enlargements, and the appropriations of water allowed and decreed thereto, under the name of Alice Hardman as of the date of August 8, 1891, in the amount of 4.57 cubic feet of water per second of time, and which by mesne conveyances has vested in the parties of the first part.

Also the interests of the parties of the first part in and to that certain irrigation ditch known as Davis Brothers Sand Creek No. 2 Ditch, and its Enlargements, and the appropriations of water allowed and decreed thereto, under the name of Alice Hardman, as of the date of November 26, 1894, in the amount of 1.79 cubic feet of water per second of time, and which by mesne conveyances has vested in the parties of the first part.

The parties of the first party hereby intend to convey and do hereby convey all their rights, title, and interests, in and to the Le Roy Ditch and its appropriations of water conveyed to Bruce G. Eaton by James M. Hoge by deed dated February 3, 1906, and recorded in the office of the county clerk of Albany county, state of Wyoming, May 7, 1909, in book R-1 of deeds, at page 246; also the parties of the first part hereby intend to convey and do hereby convey all their rights, title, and interests in and to the James Hardman No. 2 Ditch, The James Hardman No. 1 Ditch, The Davis Brothers No. 1 Ditch and The Davis Brothers No. 2 Ditch, and all of the appropriations of water therefor, which are mentioned and described, and thereby in- [fol. 3117] tended to be conveyed, and were conveyed to them in that certain deed from James Hardman and Alice Hardman to Bruce G. Eaton, dated March 30, 1906, and recorded in the office of the county clerk of Albany county, in the state of Wyoming, on May 7, 1909, in book R-1 of deeds, at page 244.

To have and to hold the same together with all and singular the appurtenances and the privileges thereunto belonging, or in anywise appertaining, and all the estate, right, title, claim and interest whatsoever of the said parties of the first part, therein or thereto, either in law or in equity, to the only proper use, benefit and behoof of the said party of the second part, its successors and assigns forever.

And for the considerations aforesaid, I, the said Martha L. Eaton, wife of the said Bruce G. Eaton, do hereby relinquish and release unto the said party of the second part, its successors and assigns forever, all my rights, and including the release and waiver of the right of Homestead, and all of my rights whatsoever, of, in and to the aforegranted premises and property.

In witness whereof the said parties of the first part, have hereunto set their hands and seals the day and year first above written.

Bruce G. Eaton. (Seal.) Martha L. Eaton. (Seal.)

Signed, sealed and delivered in the presence of W. P. Cudmore, Ray C. Eaton.

[fol. 3118] STATE OF COLORADO,
County of Weld, ss:

I, William P. Cudmore, a notary public in and for the said county, in the State aforesaid, do hereby certify that Bruce G. Eaton and Martha L. Eaton, who are personally known to me to be the same persons whose names are subscribed to the foregoing instrument, appeared before me this day in person, and acknowledged that they signed, sealed and delivered, the said instrument of writing as their free and voluntary acts, for the uses and purposes therein set forth, including the release and the waiver of their rights of Homestead in and to the properties therein described.

And I further certify that Martha L. Eaton, wife of the said Bruce G. Eaton, while separate and apart from her husband, was by me fully apprised of her rights and the effect of signing and acknowledging the said instrument, the contents and nature of which were explained to her by me, and thereupon, while so separate and apart from her said husband, and out of his hearing, she signed and acknowledged the said instrument, and acknowledged to me that she released and waived her rights of Homestead in, of and to the said properties, and also signed and acknowledged the said instrument, freely and voluntarily, for the uses and purposes therein set forth.

Given under my hand and notarial seal this 2nd day January, A. D. 1920.

William P. Cudmore, Notary Public. (Seal.)

My commission expires November 1, 1922.

DEFENDANT'S EXHIBIT X-3

LARAMIE WYOMING November 24, 1926.

Letter X-3

H. D. Parker, President,
Laramie Poudre Irrigation Co.,
Greeley, Colorado.

Dear Sir:

Miss Agnes Zimmerman, personally and as agent for other parties interested in the John Zimmerman estate on their ranch situated on the Cache La Poudre River near Home postoffice, has retained me in relation to the adjustment of her conflicts with you and others in the matter of the water rights and damages to the land by trans-mountain diversion.

I have not gone into the matter very thoroughly, nor have I given it much time. But from the general statement of Miss Zimmerman and papers she has in her possession, it seems to me that Miss Zimmerman has a cause of action against you and others. You ought to know, or can easily find out from information from your engineers and other papers in your records, how much the Zimmerman Ranch has been damaged.

It will be a very expensive and disagreeable matter to work up the evidence in this case, as it involves such a scope of territory in relation to the diversion of water rights. And I did not think that I would be justified in putting Miss Zimmerman to this expense unless I first told you what was being done, and that perhaps you would be willing to try to adjust the matter out of Court.

If it becomes necessary to commence a suit to protect the Zimmerman interests, of course it will be necessary for me to obtain the evidence and involve in this suit the water interests in Jackson County and Grand County as these rights are conflicting.

It also probably would be necessary to include in this action the users on the North Platte in Nebraska. This would make an endless complication and probably would cause damage which can be avoided. If this suit were tried, it would furnish information to California on their Imperial Water suit which might be very adverse to Colorado.

It would be perfectly satisfactory with me if you would take the matter up with Miss Zimmerman directly as she is located nearer to you than I am. If I do not hear from you by the 10th of December next, I will proceed to collect the evidence and commence a proper suit to protect the interests of the Zimmerman estate.

THE STATE OF WYOMING,
Complainant,

vs.

THE STATE OF COLORADO,
Defendant,

Original

Motion for Leave to File Bill of Complaint in Equity

To the Honorable The Chief Justice and the Associate Justices of the Supreme Court of the United States:

The State of Wyoming, one of the states of the union of the United States of America, appearing by William O. Wilson, its attorney general, upon the application of Frank C. Emerson, Governor of the State of Wyoming, and in compliance with the request of Honorable John A. Whiting, State Engineer and its Commissioner charged with author-

ity in relation to interstate streams, respectfully applies for leave to file as an original cause in this court its bill of complaint in equity against the State of Colorado, which bill of complaint is attached hereto and submitted herewith.

The State of Wyoming respectfully shows that in an original proceeding in this court commenced by the State of Wyoming on or about the 29th day of May, A. D. 1911 and reported under the name of Wyoming vs. Colorado in Volume 259, United States Supreme Court Reports, Page 419, wherein this Honorable Court considered and determined the rights of the State of Wyoming and of the State of Colorado, and through said state the rights of the respective citizens, residents and inhabitants thereof, to appropriate and apply to beneficial use the waters of the Laramie River, a stream with its headwaters in the State of Colorado and flowing into and through a portion of the State of Wyoming.

That in the final determination of said court, as found in the decree entered in said original cause, reported in Volume 259, United States Supreme Court Reports, Page 496, it was decreed that the annual available supply of water for appropriation and application to beneficial use from said Laramie River and/or its tributaries was in the amount of 310,250 acre-feet.

That the State of Colorado is entitled to divert, appropriate and use, by means of what is in said decree designated as the Skyline Ditch Diversion, the annual amount of 18,000 acre-feet; the further amount of 4,250 acre-feet annually to be diverted and applied to the irrigation of that number of acres of meadow lands in the State of Colorado; which said appropriations and diversions by said decree were recognized as having a priority over any appropriations in the State of Wyoming;

That Wyoming had the right to divert, appropriate and apply to beneficial use 272,500 acre-feet of water annually of said stream and/or its tributaries to irrigate 181,500 acres of land in the State of Wyoming; leaving the amount of 15,500 acre-feet available annually for diversion through the Laramie-Poudre Tunnel;

That such findings and determinations by said court as to the use of said waters in said respective amounts should not prejudice the right of the State of Colorado, or of anyone recognized by her as duly entitled thereto, to continue to exercise the right then existing and recognized to divert and take from the headwaters of Deadman Creek, a Colorado tributary of the Laramie River, the relatively small amount of water appropriated therefrom prior to the year 1902 by and through the Wilson Supply Ditch; nor prejudice nor affect the right of the State of Colorado, or the State of Wyoming, or anyone recognized by either state as duly entitled thereto, to continue to exercise the right to divert and use water from Sand Creek, sometimes spoken of as a tributary of Laramie River; in virtue of any then existing and lawful appropriation of waters of said creek;

That notwithstanding such findings and determinations by this Honorable Court as to the rights of the State of Colorado and the State of Wyoming to divert and appropriate to beneficial use the waters of said Laramie River and/or its tributaries in the manner and amount as in said final decree stated, which said decree is found, made and entered, in said original cause, and reported in Volume 259, United States Supreme Court Reports, Page 496, wherein the amount of water available for appropriation for the State of Colorado was found, stated and limited to an aggregate amount of 37,750 acre-feet to be diverted annually by means of the several diversions as recognized in said

decree, the State of Colorado is now and has been for a period of many years last past, and threatens to continue, acting through its officers, agents and representatives, making excessive, additional and/or unlawful diversions of water from the watershed of said Laramie River and/or its tributaries; and through its officers and agents authorize and permit the users of water from such unlawful diversion to have adjudicated to them, and for their benefit, decrees recognizing and allowing the continuance of such unlawful diversions, which are accomplished by means of the following storage and diversions, to-wit: the Bob Creek ditch; Lost Lake Reservoir system, consisting of Laramie Lake, Lost Lake, Lily Lake and Twin Lakes, the Deadman Ditch Feeder or Wilson Supply ditch; the Deadman Extension Ditch, and the Divide Ditch, and the Skyline Ditch; and the excessive or unrecorded Laramie-Poudre Tunnel diversions, and used to carry such diverted waters over into the Cache la Poudre River for use in the State of Colorado; and also all excessive and unrecorded diversions on the meadow lands in Colorado.

The State of Wyoming now prays leave to file its Bill in Equity in this court and bring to the attention of this court the matters as in its Bill of Complaint set forth and complained of against the State of Colorado, to the end that this court will prevent the continuance of such unlawful diversions of the waters of said Laramie River and/or its tributaries, and prevent further loss and damage to the State of Wyoming and to its citizens, residents and inhabitants by enabling said State of Wyoming to have for the use and benefit of its citizens, residents and inhabitants the waters from said river and/or its tributaries in accordance with the terms of the decree of this court, as determined in said original proceeding in this court heretofore referred to.

Wherefore the State of Wyoming prays leave to file its original Bill of Complaint as above stated.

Respectfull submitted,

THE STATE OF WYOMING

By WILLIAM O. WILSON
Attorney General of the State of Wyoming.
JAMES A. GREENWOOD
Deputy Attorney General of the State of Wyoming.
RICHARD J. JACKSON
Assistant Attorney General of the State of Wyoming.
PHILIP S. GARBUTT
Assistant Attorney General of the State of Wyoming.

THE STATE OF WYOMING,
Complainant,

vs.

THE STATE OF COLORADO,
Defendant.

Original

Bill of Complaint in Equity

To the Honorable, the Chief Justice and Associate Justices of the Supreme Court of the United States:

The State of Wyoming, by William O. Wilson, Attorney General of the State, under the direction of the Honorable Frank C. Emerson, Governor of the State, and in compliance with the request of the Honorable John A. Whiting, State Engineer of the State, and its Commissioner charged with authority in relation to interstate streams, by leave of this Honorable Court first had and obtained, brings this,

its original bill of complaint, in its own behalf and that of its officials, agents, servants, and other citizens, residents and corporations, against the State of Colorado in its own behalf and that of its officials, agents, servants, representatives and other citizens, residents and corporations; and respectfully sets forth and alleges, as its first cause of action:

FIRST

That your complainant is one of the states of the United States entitled to enjoy all the privileges, rights and powers, and with all the duties, including the duty of protecting the rights, interests and property of its citizens and residents possessed or devolved upon each and all of said states of the United States of America.

SECOND

That the State of Colorado is likewise one of the states constituting the United States of America entitled to enjoy all the privileges, rights and powers, and with all the duties, including the duty of protecting the rights, interests and property of its citizens and residents possessed and devolving upon each and all of said states of the United States of America.

THIRD

That on May twenty-ninth, A. D. 1911, an original suit in equity was instituted in this Honorable Court, by the above named complainant, the State of Wyoming, against the State of Colorado and the Greeley-Poudre Irrigation District and the Laramie-Poudre Reservoirs & Irrigation Company, to prevent a proposed diversion in Colorado of part of the waters of the Laramie River, an interstate stream; the opinion in said case rendered June 5, 1922, appearing

in Vol. 259, U. S. Reports, page 419; 66 Law Edition, page 999; and the modified decree therein entered Oct. 9, 1922, appearing in said 259 U. S. Reports, page 496; 66 Law Edition, page 1026.

FOURTH

That it was found and determined in said case that the said Laramie is an unnavigable river which has its source in the mountains of northern Colorado, flows northerly twenty-seven miles in that state, crosses into Wyoming, and there flows northerly and northeasterly one hundred and fifty miles to the North Platte river, of which it is a tributary; and that both Colorado and Wyoming are in the arid region where flowing waters are, and long have been, commonly diverted from their natural channels and used in irrigating the soil and making it productive; and that for many years some of the waters of the Laramie river have been subjected to such diversion and use, part in Colorado and part in Wyoming.

FIFTH

That this Honorable Court further found the entire water supply available for the proposed Colorado appropriation and the Wyoming appropriations down to and including the diversion for the Wheatland district is 288,000 acre-feet per annum; and that there are some existing Colorado appropriations having priorities entitling them to precedence over many of the Wyoming appropriations; that these recognized Colorado appropriations are 18,000 acre-feet to be diverted by what is known as the Skyline ditch diversion, and 4,250 acre-feet for the irrigation of that number of acres of native-hay meadows in the Laramie valley in Colorado; and that these recognized Colorado appropriations, aggregating 22,250 acre-feet, were not to be deducted from

the 288,000 acre-feet, that being the available annual supply after they are satisfied; and that thus the total available annual supply of water for irrigation, in Wyoming and Colorado out of the waters of the Laramie river and its tributaries, was said 288,000 acre-feet of water, and said 22,250 acre-feet of water; or a total available annual supply of water for irrigation of lands in Colorado and Wyoming from the Laramie river and its tributaries in the total sum of 310,250 acre-feet of water; in addition to the waters of Sand Creek, which rises in Colorado and extends into the Laramie plains in Wyoming, and discharges into Hutton Lake, a few miles from the Laramie River, and the waters of which creek, for reasons stated in the opinion, were not regarded by this Honorable Court as a factor in the controversy;

SIXTH

That this Honorable Court further found and determined that the evidence showed that the Wyoming appropriations having priorities senior to the one in Colorado, and which are dependent on the available water supply before named, cover 181,500 acres of land, and that the amount of water appropriated and reasonably required for the irrigation of said lands is 272,500 acre-feet; that a much larger amount was claimed, but the findings of the court restricted the amount to what the evidence showed was reasonably required; and that as the available supply is 288,000 acre-feet, and the amount covered by senior appropriations in Wyoming is 272,500 acre-feet, there remains 15,500 acre-feet which are subject to the junior appropriation in Colorado, to-wit: the Laramie-Poudre Tunnel appropriation.

SEVENTH

That in and by its final decree, this Honorable Court then considered, ordered and decreed, that the defendants, their officers, agents and servants be, and they were thereby, severally enjoined from diverting or taking from the Laramie River and its tributaries in the State of Colorado, more than fifteen thousand five hundred (15,500) acre-feet of water per annum, in virtue of or through what is designated in the pleadings and evidence as the Laramie-Poudre tunnel appropriation in that state; and provided therein that said decree should not prejudice the right of the State of Colorado, or of anyone recognized by her as duly entitled thereto, to continue to exercise the right existing and thereby recognized to divert and take from such stream and its tributaries in that state the following:

(1) Eigheen thousand (18,000) acre-feet of water per annum in virtue of and through said Skyline ditch appropriation in that state;

(2) Four thousand two hundred and fifty (4,250) acre-feet of water per annum in virtue of and through the meadow-land appropriations in that state;

(3) The relatively small amount of water appropriated from the headwaters of Deadman Creek, a Colorado tributary of the Laramie River, prior to the year 1902, by and through what is designated in the evidence as the Wilson Supply Ditch; and

(4) That the decree should not prejudice or affect the right of the State of Colorado or the State of Wyoming, or anyone recognized by either state as duly entitled thereto, to continue to exercise the right to divert and use water from Sand Creek, sometimes spoken of as a tributary of the Laramie River, by virtue of any existing and lawful appropriation of the waters of such creek.

EIGHTH

That plaintiff has been reliably informed, and therefore on information and belief alleges the fact to be that the gauging and measuring devices installed by the defendant do not accurately gauge and measure the full amount of water diverted by means of and through the designated lawful diversions as defined in the said decree of this Honorable Court.

NINTH

That the State of Colorado, as your complainant is informed and believes, and therefore alleges the fact to be, has permitted water to be diverted from the Laramie River and its tributaries by means of and through the Laramie-Poudre tunnel diversion in excess of 15,500 acre-feet per annum; that during portions of the year 1926, there were, as shown by the official records of Colorado, diversions through said tunnel of 13,572 acre-feet, and unreported diversions through said tunnel in the amount of over 3,000 acre-feet, making a total diversion for the year 1926 in excess of the amount of 15,500 acre-feet as provided in said decree; that such measurements, on which complainant has relied, are from the records certified by the State Engineer of Colorado; based on records of the water commissioner of the district, who compiled the original record of measurements; that, however, the records of the division engineer, certified to by him, show the diversion of 5644 acre-feet, instead of 13,572 acre-feet, of water;

TENTH

That through, by and under said decree, the State of Wyoming was found by this Honorable Court to be entitled to an amount of water for the purpose of irrigating lands in said state far in excess of the amount of water to which

the State of Colorado was entitled, for the purpose of irrigating lands in the State of Colorado; and therefore has a vital interest in the appropriation, diversion and measurement of the waters of the Laramie river and its tributaries in Colorado, and should therefore be permitted to install its own standard gauging devices and make its own measurements of diversion of water from said Laramie River and its tributaries in Colorado; yet Colorado, though requested in writing by Wyoming for such permission, denied such request; and that, therefore, all allegations herein as to the measurements of water and the quantities are necessarily dependent on the gauging devices and measurements and records thereof as kept by Colorado and its officials.

ELEVENTH

That the State of Colorado has, in the manner and by the means hereinafter alleged, violated and disregarded said decree and the terms thereof; and the injunction therein contained against the excessive or otherwise unlawful diversions, of water, as hereinafter described;

TWELFTH

That during the following years there was diverted in the State of Colorado by its officials, agents, representatives, and other citizens and residents, by and with the knowledge, consent, permission, and cooperation of the said State of Colorado, and its officials, agents, representatives and servants, from the Laramie River and its tributaries in Colorado, to the Cache La Poudre River, for the irrigation of lands in Colorado, the following amounts of water in excess of the 18,000 acre-feet of water, being the amount authorized so to be diverted under said decree of this Honorable Court by said Skyline Ditch, to-wit:

(1) During the year 1927, 22,150 acre-feet of water, or 4,150 acre-feet in excess of the annual amount of water authorized by said decree thus to be diverted;

(2) During the year 1928, 19,397 acre-feet of water, or 1,397 acre-feet in excess of the annual amount of water authorized by said decree thus to be diverted;

(3) During the year 1929, 24,363 acre-feet of water, or 6,363 acre-feet of water in excess of the annual amount authorized by said decree thus to be diverted.

THIRTEENTH

That during the following years there was diverted in the State of Colorado by its officials, agents, representatives, and other citizens and residents, and corporations, by and with the knowledge, consent and cooperation of the said State of Colorado, and its officials, agents, representatives and servants, from the Laramie River and its tributaries in Colorado, the following amounts of water in excess of the amount authorized under said decree to be diverted for the purpose of irrigating 4,250 acres of meadow land in the State of Colorado:

(1) During the year 1926, 61,767 acre-feet of water, or 57,517 acre-feet of water in excess of the annual amount authorized by said decree thus diverted, which was used to irrigate 6,162 acres of natural hay meadows.

(2) During the year 1927, 54,152 acre-feet of water, or 49,902 acre-feet of water in excess of the annual amount authorized by said decree thus diverted, which was used to irrigate 5,517 acres of natural hay meadows.

(3) During the year 1928, 56,275 acre-feet of water, or 52,025 acre-feet of water in excess of the annual amount authorized by said decree thus diverted, which was used to irrigate 6,767 acres of natural hay meadows.

(4) During the year 1929, 58,772 acre-feet of water, or

54,522 acre-feet of water in excess of the annual amount authorized by said decree thus diverted, which was used to irrigate 6,792 acres of natural hay meadows.

FOURTEENTH

That in addition to the excessive and unlawful diversions in violation of said decree of this Honorable Court, as above alleged, the State of Colorado, by its officials, agents and servants, and by and with the knowledge, consent and cooperation of the said State of Colorado, and its officials, agents and servants, has permitted the following unlawful and/or excessive trans-mountain diversions of water to be made from the Laramie River and its tributaries in Colorado through the Bob Creek ditch; Lost Lake Reservoir System; Columbine ditch; the Deadman Ditch Feeder or Wilson Supply Ditch; the Divide ditch; and the Deadman Extension Ditch; to the watershed of the Cache La Poudre River for the irrigation of lands in Colorado, contrary to and in violation and disregard of the terms of said decree of this Honorable Court, as follows:

1. The Bob Creek ditch as constructed, heads north fifty-eight degrees fifty-six minutes west three thousand and five (3005) feet from the quarter corner between sections three and ten, in township nine north of range seventy-five west of the sixth principal meridian; that from this point it has a northeasterly course to near the center of section three; thence in a southeasterly course through the southeast quarter of section three and the southwest quarter of the southwest quarter of section two; thence in a southeasterly course through the north one-half of section eleven in said township and range, emptying into Roaring Fork, a Colorado tributary of the Cache La Poudre River, in the southwest quarter of the northeast quarter of section eleven, in said township and range; that the length of the

ditch is two and one-half miles, that the cross section shows a bottom width of four feet capable of carrying two feet depth of water, eight feet wide at two-foot water level; that it has a fall of five feet per mile, with an approximate carrying capacity of thirty-six second feet of water;

2. That a small ditch eight hundred (800) feet long has been constructed across a marsh to divert water into Bob Creek Ditch about the southeast quarter of the northwest quarter of section eleven, township nine north of said range; that the sources of supply of said Bob Creek ditch are several tributaries of Nunn Creek, and that the water then flows into Roaring Fork Creek, a tributary of the Cache La Poudre River; and thus the water is thereby unlawfully diverted from the Laramie River and its tributaries into the Cache La Poudre watershed for the irrigation of lands in Colorado, contrary to and in violation and disregard of the terms of the said decree of this Honorable Court; and that the records of such unlawful diversions as kept by Colorado officials are as follows:

(1) In the year 1922, 512 acre-feet
(2) In the year 1923, 1174 acre-feet
(3) In the year 1924, 0 acre-feet
(4) In the year 1925, 745 acre-feet
(5) In the year 1926, 0 acre-feet
(6) In the year 1927, 1044 acre-feet
(7) In the year 1928, 535 acre-feet
(8) In the year 1929, 1153 acre-feet

That there is also an unfinished extension ditch to said Bob Creek ditch:

3. The Columbine ditch is located in sections twenty-six and thirty-five, township ten north of said range, in the State of Colorado; that the length of the ditch is one and three-tenths (1.3) miles; that the ditch has an average cross section of four-foot bottom, six feet at water level, with a

depth of two feet, and a slope of five feet per mile; that its approximate carrying capacity is thirty second feet; that its source of supply is Columbine Creek or a branch of it being tributaries of the Laramie River; that the greater part of the water being carried by it is the early run-off; that the water from the said Columbine ditch is discharged into a branch of the North Poudre river, and thence into the Poudre River watershed, for the irrigation of lands in Colorado, contrary to and in violation and disregard of the terms of the said decree of this Honorable Court; and that the records of such unlawful diversions have been kept by the officials of Colorado, as follows:

(1) In the year 1922, 181 acre-feet;
(2) In the year 1923, 332 acre-feet;
(3) In the year 1924, 0 acre-feet;
(4) In the year 1925, 259 acre-feet;
(5) In the year 1926, 0 acre-feet;
(6) In the year 1927, 376 acre-feet;
(7) In the year 1928, 373 acre-feet;
(8) In the year 1929, 590 acre-feet;

4. The Lost Lake system is composed of five lakes: Lost Lake, Laramie Lake, Lily Lake, and the Twin Lakes; but that three of such lakes only are used for storing water, to-wit: Lost Lake, Laramie Lake and Lily Lake; their capacity being 806 acre-feet of water:

(1) Lost Lake, which is located in the northeast quarter of section six, in township seven north of said range, and in the southeast quarter of section thirty-one in township eight north of said range;

(2) Laramie Lake, which is located in the northwest quarter of the southwest quarter, and the southwest quarter of the northwest quarter of section thirty-two, in township eight north of said range; that a ditch has been constructed in order that the water from the Lar-

amie Lake will flow into Lost Lake, and thence into Chambers Lake situated at the head of the Cache La Poudre River, into which river it flows;

(3) Lily Lake, which is located near the center of section twenty-nine, in township eight north of said range; that the water from Lily Lake flows down a natural channel to Laramie Lake;

(4) Twin Lakes, which are located in the northwest quarter of section twenty-nine, in township eight north of said range; that such lakes have no dike to hold water as the other three lakes of the Lost Lake system have; but a ditch has been constructed to drain these lakes which flows into a natural channel into Laramie Lake;

(5) That the sources of supply of said Lost Lake system are unnamed tributaries of the Laramie River; and that the water flows therefrom into said Chambers Lake; that all the water stored in these lakes would flow into the Laramie River if the dams and ditches did not cause the water to flow into Chambers Lake, thence into the Cache La Poudre River; and thus the water is thereby unlawfully diverted from the Laramie River and its tributaries into the Cache La Poudre watershed for the irrigation of lands in Colorado, contrary to and in violation and disregard of the terms of the said decree of this Honorable Court; and that the only record of the water diverted by the officials of Colorado shows that in the year 1926, 448 acre-feet were thus unlawfully diverted;

5. The Deadman Ditch Feeder, or Wilson Supply Ditch, has its headgate in the southeast quarter of section fifteen, township ten north of said range; and runs in a northwesterly course; is one and three-tenths (1.3) miles long, with

a five-foot fall per mile; has a cross section of eight-foot bottom, three feet depth of water, thirteen feet across at water level, carrying capacity of approximately one hundred and thirty second-feet; its main source of water is Deadman Creek or a tributary to it; and the water flows through this ditch into Sand Creek, and from Sand Creek is diverted by the Divide ditch, sometimes also known as the Wilson Supply ditch, into Sheep Creek, a tributary of the North Cache La Poudre River, which flows into the Cache La Poudre River, for the irrigation of lands in Colorado;

6. The Deadman Extension ditch is an extension of the Deadman ditch Feeder or Wilson Supply ditch, running to the south to intercept several small streams; that it extends from the Deadman Feeder ditch in the southwest quarter of section fourteen, in township ten north of said range, in a general southerly direction through the east half of section twenty-two and the west half of section twenty-three, diverting water from two small streams in the west half of said section twenty-three; and the ditch is extended a short distance beyond the point where the water is diverted in the southwest quarter of said section twenty-three.

7. That an examination of said Deadman Extension ditch in 1929 disclosed that a survey of the ditch had been made for an enlargement; the slope stakes being set for enlarging the ditch from a three-foot bottom to a six-foot bottom; that the point where the enlargement stakes were set was north thirteen degrees east six hundred feet from the southwest corner of section fourteen, in township ten north of said range; thence in a southwesterly course thirty-two hundred feet; thence in a southeasterly course about twenty-four hundred feet to a branch of Deadman Creek; passing through the southwest quarter of the southwest quarter of section fourteen; thence through the southeast

quarter of the southeast quarter of section fifteen; thence through the northeast quarter of section twenty-two, ending in the southwest quarter of the northwest quarter of section twenty-three; all in said township ten north of said range;

8. That an enlargement based on such survey was made in the fall of 1929; and in 1930 it was disclosed that said ditch had been recently constructed to a six-foot bottom; that the ditch can, as reconstructed and enlarged, carry a two-foot depth of water with a two-foot freeboard; that the slope or fall per mile is approximately five feet; that the ditch is capable of carrying forty-eight second feet of water; that part of the ditch carrying water last year has not been enlarged this year.

FIFTEENTH

That in and by the Decree of this Honorable Court, as heretofore alleged, it was provided that said decree should not prejudice the right of the State of Colorado, or of anyone recognized by her as duly entitled thereto, to continue to exercise the right then existing and thereby recognized to divert and take from such stream (Laramie) and its tributaries the relatively small amount of water appropriated from the headwaters of Deadman Creek, a Colorado tributary of the Laramie River, prior to the year 1902, by and through what is designated in the evidence as the Wilson Supply Ditch; that insofar as said extension and enlargement of said Wilson Supply Ditch, otherwise known as the Deadman Feeder ditch to the Wilson Supply Ditch, together with the Divide Ditch, divert more than the relatively small amount of water appropriated from the headwaters of Deadman Creek, prior to the year 1902, by and through what was designated in said decree as the Wilson Supply ditch, such enlargement has been done contrary to

and in violation and disregard of the decree of this Honorable Court, and for the purpose of increasing the amount of water thus diverted.

SIXTEENTH

That there are pending at this time in the district court of Larimer County, Colorado, applications filed July 12, 1926 on behalf of the Water Supply and Storage Company, as owner, of said Laramie Lake, Lost Lake and Lily Lake, referred to therein as reservoirs, for the purpose of having decreed to said owner, authority under the laws of Colorado, to divert and store water for irrigation purposes in said reservoirs; in the amount and capacity in the petitions filed therein set forth; the petitions alleging further that said Laramie reservoir has an area of forty-seven acres, and an estimated capacity of 14,817,744 cubic feet of water; that said Lost Lake reservoir has an area of twenty-six acres, and an estimated capacity of 12,541,030 cubic feet of water; that said Lily Lake reservoir has an area of fifty-nine and five-tenths acres, and an estimated capacity of 7,747,189 cubic feet of water;

SEVENTEENTH

That there is also pending in the said district court of Larimer County, Colorado, the application filed July 12, 1926 of the Mountain and Plains Irrigation Company, owner of the Bob Creek ditch, for the purpose of having decreed to it an adjudication of priority to waters to be diverted from the Laramie River Basin by means of said Bob Creek ditch diversion, sometimes known as Nunn Creek ditch, said petition alleging as follows: That said ditch begins in section three and ends in section two, in township nine north of said range; that it is eight thousand one hundred

and thirty feet (8130) long, with a carrying capacity of one hundred cubic feet per second of time; that as a part of said Bob Creek ditch, a feeder ditch was constructed, located in said section two; and also that the Bob Creek Extension ditch across the channel of said Bob Creek, also sometimes known as Nunn Creek ditch, is completed to a distance of approximately six thousand feet, and has a carrying capacity of fifty cubic feet per second of time; and that said Bob Creek ditch and said Bob Creek Extension ditch are used for the irrigation of agricultural lands in the counties of Larimer and Weld in the State of Colorado, the number of acres not being alleged; and that said applications for said decrees are now pending before referees.

EIGHTEENTH

That a topographical map of the watershed of the Laramie river and its tributaries in Colorado, showing the location of the diversions, described herein, is attached hereto, marked "Exhibit A" and hereby expressly made a part hereof;

NINETEENTH

That officials of the State of Wyoming, charged with the supervision of the waters of the state and of their appropriation, diversion and distribution, have conferred with like officials of the State of Colorado, and have protested orally against such excessive or otherwise unlawful diversions of water from the Laramie River and its tributaries in Colorado, for the irrigation of lands in Colorado, contrary to and in violation and disregard of said decree of this Honorable Court; but such officials of Colorado have denied that any such excessive or otherwise unlawful diversions existed; and that such officials in Wyoming further protested in writing to the said officials of Colorado against

such excessive and otherwise unlawful diversions; and such officials of Colorado replied in writing that they were unable to find that Colorado or her citizens had violated the decree of this Honorable Court, and were at all times willing and anxious to abide by the terms thereof, and requested a conference of such officials, which was accordingly held on September 26th, A. D. 1930; and that at such conference the assertion on behalf of Wyoming, of such excessive and otherwise unlawful diversions of water by and on behalf of Colorado, as herein alleged, was denied by and on behalf of Colorado; and that, therefore, your complainant is without relief from such excessive and otherwise unlawful diversions of water, except through and by the order, judgment and decree of this Honorable Court.

TWENTIETH

That furthermore, the State of Colorado, unless restrained by this Honorable Court, will, through its officials, agents, representatives, servants, or other citizens or residents, or its corporations, continue to increase the diversion of water from the Laramie River and its tributaries for the irrigation of lands in Colorado; and unless restrained, will continue until the amount of water determined by the decree of this Honorable Court as being available to Wyoming for the water users in Wyoming, to-wit: 272,500 acre-feet, will be gradually reduced and finally consumed, and Wyoming and its citizens, residents and corporations will be deprived of any protection under the said decree to the use of the waters to which it was determined by said decree to be entitled, and that annually since the entry of said decree, the amount of water available to the State of Wyoming for its water users has been less than said 272,500 acre-feet of water per annum; caused by reason of said excessive and otherwise unlawful diversions;

TWENTY-FIRST

Your complainant, the State of Wyoming, offers to do full and complete equity to the State of Colorado in respect to the administration, diversion and use of the waters of the Laramie River and its tributaries; but this complainant alleges that no other court than this Honorable Court, upon the general doctrines of law, or the constitution of the United States, or under the specific adjudication and decree and the governing principles set forth in the said case of Wyoming vs. Colorado, et al., has any authority or jurisdiction whatsoever to adjudicate upon the matters which were adjudicated in said decree in said case; and furthermore, that Colorado, and through it, its officials, agents, representatives, servants, and other citizens and residents, and its corporations, should be required by this Honorable Court to abide by the terms of said decree, and be prevented by this Honorable Court from any violation of the terms thereof.

TWENTY-SECOND

Your complainant has no adequate remedy at law, nor any remedy at law, nor any remedy in any court whatsoever, except this Supreme Court of the United States, in respect to the matters and things herein set forth and alleged.

Second Cause of Action

The State of Wyoming by William O. Wilson, Attorney General of the State, under the direction of the Honorable Frank C. Emerson, Governor of the State, and in compliance with the request of the Honorable John A. Whiting, State Engineer of the State and its Commissioner charged with authority in relation to interstate streams, by leave of this Honorable Court first had and obtained, brings this its original bill of complaint, in its own behalf and that of its officials, agents, servants, and other citizens and residents and corporations, against the State of Colorado, in its own behalf, and that of its officials, agents, servants, representatives and other citizens, residents and corporations, and respectfully and fully sets forth and alleges as and for its second cause of action:

FIRST

Complainant refers to all matters and things alleged and set forth in paragraphs numbered first to twenty-first both inclusive of this petition, and makes all of the said matters and things alleged in said paragraphs numbered first to twenty-first both inclusive of said first cause of action, a part of this its second cause of action, with the same effect and to all intents and purposes, as though herein specifically set forth and alleged herein.

SECOND

That the State of Wyoming made request on March 8, 1928, in writing, of the State of Colorado for permission to install measuring devices in order to make an inventory of such waters in Colorado, jointly with Colorado and with the United States Geological Survey, such inventory to be made

by Wyoming, at its own expense; but that this request was denied in writing on April 5, 1928, by the State of Colorado, and that by reason of such refusal, Wyoming, with a greater interest than Colorado in the said waters of the Laramie River watershed, by virtue of the said decree of this court, is compelled to rely on the measurements made by Colorado.

THIRD

That, therefore, the State of Wyoming should be permitted by means of the order of this Honorable Court, to install gauging devices in the State of Colorado, in the Laramie River and its tributaries and in any transmountain ditches, lakes and reservoirs by means of which water is being or may be diverted from said Laramie River and its tributaries in the State of Colorado to the Poudre River basin; and to take any and all measurements therefrom for the purpose of ascertaining the amount of water being appropriated and diverted from said Laramie River and its tributaries, for the irrigation of lands in Colorado, or that such installation of gauges, and measuring of such waters should be carried on by the Federal Government, at the expense of the said states.

FOURTH

Your complainant, the State of Wyoming, offers to do full and complete equity to the State of Colorado in respect to the matters and things in this cause of action alleged.

FIFTH

Your complainant has no adequate remedy at law, or any remedy at law, nor any remedy in any court whatsoever except this Supreme Court of the United States in respect to the matters and things herein set forth and alleged.

WHEREFORE the State of Wyoming prays as to its first and second causes of action herein that this Honorable Court may cause its subpoena or other proper process to issue under the seal of this Court, summoning the State of Colorado, as defendant to appear herein, present its answer, if any, and abide by the determination of this Court; and that this Honorable Court may exercise its sole jurisdiction over the determination of the use of the waters of the Laramie river and its tributaries, and protect and quiet the rights of the State of Wyoming, its officers, agents, representatives or other citizens and residents, and its corporations, under the adjudication and decree in said case of Wyoming vs. Colorado, et al.; and also that the State of Wyoming be permitted to install standard gauging devices, and take any and all such requisite measurements of water, and make records thereof, as heretofore alleged; or that such installation of gauges and measuring and recording of such waters be carried on by the Federal Government, and that in the event the said court shall find in and by said decree that the injunction entered therein applied only to the diversion by the State of Colorado of the waters through the Laramie-Poudre Tunnel, that this Honorable Court may, temporarily, during the pendency of this cause, and permanently, on the final determination hereof, enjoin the said State of Colorado, and through it or otherwise, as the court may determine, its officers, agents, representatives or servants, or other persons or citizens and its corporations, from diverting any water from said Laramie River and its tributaries in Colorado,

for the irrigation of lands in Colorado, in excess of the available quantities of water allotted to Colorado in and by said decree; or from further adjudication thereon in the Courts of Colorado; and that this Honorable Court give and grant such other full, further, or different relief as may be just and equitable.

THE STATE OF WYOMING

By WILLIAM O. WILSON
Attorney General of the State of Wyoming.

THE STATE OF WYOMING, *Complainant,*
vs.
THE STATE OF COLORADO, *Defendant.*

Notice:

To the State of Colorado, defendant herein; and to the Honorable John S. Underwood, Attorney General of the said State, and Solicitor for said defendant:

You will please take notice that at the incoming of the Supreme Court of the United States, at the capitol building, in the City of Washington, District of Columbia, at 12:00 o'clock noon, on October 6th, A. D. 1930, or as soon thereafter as solicitors can be heard, the above named complainant, the State of Wyoming, will appear by its solicitors, and present to said court, the motion of complainant, with its complaint attached thereto, against the above named defendant, the State of Colorado; and ask leave of court to file said complaint; and if the said motion be granted, will thereupon file its said complaint in the office of the Clerk of said Court; a copy of which said motion and of said complaint are presented herewith; when and where you may be present if you so desire.

Dated this October 1st, A. D. 1930.

WILLIAM O. WILSON,
Attorney General of Wyoming, and solicitor for complainant
JAMES A. GREENWOOD,
Deputy Attorney General, and solicitor for complainant

STATE OF COLORADO, }
CITY AND COUNTY OF DENVER } ss.

Service of the foregoing notice, by the delivery to me of a copy thereof, together with a copy of the motion and of the complaint therein mentioned, is hereby acknowledged, this 2nd day of October, A. D. 1930.

.....
Attorney General of Colorado, and solicitor for defendant.

In Equity

OCTOBER TERM, 1931

No......

THE STATE OF WYOMING,
Complainant,
vs.
THE STATE OF COLORADO,
Defendant.

Amended Original Bill of Complaint in Equity

To the Honorable, the Chief Justice and Associate Justices of the Supreme Court of the United States:

The State of Wyoming, by William O. Wilson, Attorney General of the State, under the direction of the Honorable Frank C. Emerson, Governor of the State, and in compliance with the request of the Honorable John A. Whiting, State Engineer of the State, and its Commissioner charged with authority in relation to interstate streams, by leave of this Honorable Court first had and obtained, brings this, its original bill of complaint, in its own behalf and that of its officials, agents, servants, and other citizens, residents and corporations, against the State of Colorado in its own behalf and that of its officials, agents, servants, representatives and other citizens, residents and corporations; and

respectfully sets forth and alleges, as its first cause of action, and permission having been granted by the Honorable Supreme Court of the United States so to do, complainant now, through its Attorney General, James A. Greenwood, files this, its amended bill of complaint:

FIRST

That your complainant is one of the states of the United States entitled to enjoy all the privileges, rights and powers, and with all the duties, including the duty of protecting the rights, interests and property of its citizens and residents possessed or devolved upon each and all of said states of the United States of America.

SECOND

That the State of Colorado is likewise one of the states constituting the United States of America entitled to enjoy all the privileges, rights and powers, and with all the duties, including the duty of protecting the rights, interests and property of its citizens and residents possessed and devolving upon each and all of said states of the United States of America.

THIRD

That on May twenty-ninth, A. D. 1911, an original suit in equity was instituted in this Honorable Court, by the above named complainant, the State of Wyoming, against the State of Colorado and the Greeley-Poudre Irrigation District and the Laramie-Poudre Reservoirs & Irrigation Company, to prevent a proposed diversion in Colorado of part of the waters of the Laramie River, an interstate stream; the opinion in said case rendered June 5, 1922, appearing in Vol. 259, U. S. Reports, page 419; 66 Law Edition, page 999; and the modified decree therein entered Oct. 9, 1922,

appearing in 260 U. S. Reports, page 1; 66 Law Edition, page 1026.

FOURTH

That it was found and determined in said case that the said Laramie is an unnavigable river which has its source in the mountains of northern Colorado, flows northerly twenty-seven miles in that state, crosses into Wyoming, and there flows northerly and northeasterly one hundred and fifty miles to the North Platte river, of which it is a tributary; and that both Colorado and Wyoming are in the arid region where flowing waters are, and long have been, commonly diverted from their natural channels and used in irrigating the soil and making it productive; and that for many years some of the waters of the Laramie river have been subjected to such diversion and use, part in Colorado and part in Wyoming.

FIFTH

That this Honorable Court further found the entire water supply available for the proposed Colorado appropriation and the Wyoming appropriations down to and including the diversion for the Wheatland district is 288,000 acre-feet per annum; and that there are some existing Colorado appropriations having priorities entitling them to precedence over many of the Wyoming appropriations; that these recognized Colorado appropriations are 18,000 acre-feet to be diverted by what is known as the Skyline ditch diversion, and 4,250 acre-feet for the irrigation of that number of acres of native-hay meadows in the Laramie valley in Colorado; and that these recognized Colorado appropriations, aggregating 22,250 acre-feet, were not to be deducted from the 288,000 acre-feet, that being the available annual supply after they are satisfied; and that thus the total available

annual supply of water for irrigation, in Wyoming and Colorado out of the waters of the Laramie River and its tributaries, was said 288,000 acre-feet of water, and said 22,250 acre-feet of water; or a total available annual supply of water for irrigation of lands in Colorado and Wyoming from the Laramie River and its tributaries in the total sum of 310,250 acre-feet of water; in addition to the waters of Sand Creek, which rises in Colorado and extends into the Laramie plains in Wyoming, and discharges into Hutton Lake, a few miles from the Laramie River, and the waters of which creek, for reasons stated in the opinion, were not regarded by this Honorable Court as a factor in the controversy;

SIXTH

That this Honorable Court further found and determined that the evidence showed that the Wyoming appropriations having priorities senior to the one in Colorado, and which are dependent on the available water supply before named, cover 181,500 acres of land, and that the amount of water appropriated and reasonably required for the irrigation of said lands is 272,500 acre-feet; that a much larger amount was claimed, but the findings of the court restricted the amount to what the evidence showed was reasonably required; and that as the available supply is 288,000 acre-feet, and the amount covered by senior appropriations in Wyoming is 272,500 acre-feet, there remains 15,500 acre-feet which are subject to the junior appropriation in Colorado, to-wit; the Laramie-Poudre Tunnel appropriation.

SEVENTH

That in and by its final decree, this Honorable Court then considered, ordered and decreed, that the defendants, their officers, agents and servants be, and they were thereby,

severally enjoined from diverting or taking from the Laramie River and its tributaries in the State of Colorado, more than fifteen thousand five hundred (15,500) acre-feet of water per annum, in virtue of or through what is designated in the pleadings and evidence as the Laramie-Poudre tunnel appropriation in that state; and provided therein that said decree should not prejudice the right of the State of Colorado, or of anyone recognized by her as duly entitled thereto, to continue to exercise the right existing and thereby recognized to divert and take from such stream and its tributaries in that state the following:

(1) Eighteen thousand (18,000) acre-feet of water per annum in virtue of and through said Skyline ditch appropriation in that state;

(2) Four thousand two hundred and fifty (4,250) acre-feet of water per annum in virtue of and through the meadow-land appropriations in that state;

(3) The relatively small amount of water appropriated from the headwaters of Deadman Creek, a Colorado tributary of the Laramie River, prior to the year 1902, by and through what is designated in the evidence as the Wilson Supply Ditch; and

(4) That the decree should not prejudice or affect the right of the State of Colorado or the State of Wyoming, or anyone recognized by either state as duly entitled thereto, to continue to exercise the right to divert and use water from Sand Creek, sometimes spoken of as a tributary of the Laramie River, by virtue of any existing and lawful appropriation of the waters of such creek.

EIGHTH

That plaintiff has been reliably informed, and therefore on information and belief alleges the fact to be that the gauging and measuring devices installed by the defendant

do not accurately gauge and measure the full amount of water diverted by means of and through the designated lawful diversions as defined in the said decree of this Honorable Court.

NINTH

That the State of Colorado, as your complainant is informed and believes, and therefore alleges the fact to be, has permitted water to be diverted from the Laramie River and its tributaries by means of and through the Laramie-Poudre tunnel diversion in excess of 15,500 acre-feet per annum; that during portions of the year 1926, there were, as shown by the official records of Colorado, diversions through said tunnel of 13,572 acre-feet, and unreported diversions through said tunnel in the amount of over 3,000 acre-feet, making a total diversion for the year 1926 in excess of the amount of 15,500 acre-feet as provided in said decree; that such measurements, on which complainant has relied, are from the records certified by the State Engineer of Colorado; based on records of the water commissioner of the district, who compiled the original record of measurements; that, however, the records of the division engineer, certified to by him, show the diversion of 5644 acre-feet, instead of 13,572 acre-feet, of water;

TENTH

That through, by and under said decree, the State of Wyoming was found by this Honorable Court to be entitled to an amount of water for the purpose of irrigating lands in said state far in excess of the amount of water to which the State of Colorado was entitled, for the purpose of irrigating lands in the State of Colorado; and therefore has a vital interest in the appropriation, diversion and measurement of the waters of the Laramie river and its tributaries

in Colorado, and should therefore be permitted to install its own standard gauging devices and make its own measurements of diversion of water from said Laramie River and its tributaries in Colorado; yet Colorado, though requested in writing by Wyoming for such permission, denied such request; and that, therefore, all allegations herein as to the measurements of water and the quantities are necessarily dependent on the gauging devices and measurements and records thereof as kept by Colorado and its officials.

ELEVENTH

That the State of Colorado has, in the manner and by the means hereinafter alleged, violated and disregarded said decree and the terms thereof; and the injunction therein contained against the excessive or otherwise unlawful diversions, of water, as hereinafter described;

TWELFTH

That during the following years there was diverted in the State of Colorado by its officials, agents, representatives, and other citizens and residents, by and with the knowledge consent, permission, and cooperation of the said State of Colorado, and its officials, agents, representatives and servants, from the Laramie River and its tributaries in Colorado, to the Cache La Poudre River, for the irrigation of lands in Colorado, the following amounts of water in excess of the 18,000 acre-feet of water, being the amount authorized so to be diverted under said decree of this Honorable Court by said Skyline Ditch, to-wit:

(1) During the year 1927, 22,150 acre-feet of water, or 4,150 acre-feet in excess of the annual amount of water authorized by said decree thus to be diverted;

(2) During the year 1928, 19,397 acre-feet of water, or 1,397 acre-feet in excess of the annual amount of water authorized by said decree thus to be diverted;

(3) During the year 1929, 24,363 acre-feet of water, or 6,363 acre-feet of water in excess of the annual amount authorized by said decree thus to be diverted.

THIRTEENTH

That during the following years there was diverted in the State of Colorado by its officials, agents, representatives, and other citizens and residents, and corporations, by and with the knowledge, consent and cooperation of the said State of Colorado, and its officials, agents, representatives and servants, from the Laramie River and its tributaries in Colorado, the following amounts of water in excess of the amount authorized under said decree to be diverted for the purpose of irrigating 4,250 acres of meadow land in the State of Colorado:

(1) During the year 1926, 61,767 acre-feet of water, or 57,517 acre-feet of water in excess of the annual amount authorized by said decree thus diverted, which was used to irrigate 6,162 acres of natural hay meadows.

(2) During the year 1927, 54,152 acre-feet of water, or 49,902 acre-feet of water in excess of the annual amount authorized by said decree thus diverted, which was used to irrigate 5,517 acres of natural hay meadows.

(3) During the year 1928, 56,275 acre-feet of water, or 52,025 acre-feet of water in excess of the annual amount authorized by said decree thus diverted, which was used to irrigate 6,767 acres of natural hay meadows.

(4) During the year 1929, 58,772 acre-feet of water, or 54,522 acre-feet of water in excess of the annual amount authorized by said decree thus diverted, which was used to irrigate 6,792 acres of natural hay meadows.

FOURTEENTH

That in addition to the excessive and unlawful diversions in violation of said decree of this Honorable Court, as above alleged, the State of Colorado, by its officials, agents and servants, and by and with the knowledge, consent and co-operation of the said State of Colorado, and its officials, agents and servants, has permitted the following unlawful and/or excessive trans-mountain diversions of water to be made from the Laramie River and its tributaries in Colorado through the Bob Creek ditch; Lost Lake Reservoir System; Columbine ditch; the Wilson Supply ditch, sometimes referred to as the Deadman Feeder Ditch; the Divide ditch; and the Deadman Extension Ditch; to the watershed of the Cache La Poudre River for the irrigation of lands in Colorado, contrary to and in violation and disregard of the terms of said decree of this Honorable Court, as follows:

1. The Bob Creek ditch as constructed, heads north fifty-eight degrees fifty-six minutes west three thousand five (3005) feet from the quarter corner between sections three and ten, in township nine north of range seventy-five west of the sixth principal meridian; that from this point it has a northeasterly course to near the center of section three; thence in a southeasterly course through the southeast quarter of section three and the southwest quarter of the southwest quarter of section two; thence in a southeasterly course through the north one-half of section eleven in said township and range, emptying into Roaring Fork, a Colorado tributary of the Cache La Poudre River, in the southwest quarter of the northeast quarter of section eleven, in said township and range; that the length of the ditch is two and one-half miles, that the cross section shows a bottom width of four feet capable of carrying two feet depth of water, eight feet wide at two-foot water level; that

it has a fall of five feet per mile, with an approximate carrying capacity of thirty-six second feet of water;

2. That a small ditch eight hundred (800) feet long has been constructed across a marsh to divert water into Bob Creek Ditch about the southeast quarter of the northwest quarter of section eleven, township nine north of said range; that the sources of supply of said Bob Creek ditch are several tributaries of Nunn Creek, and that the water then flows into Roaring Fork Creek, a tributary of the Cache La Poudre River; and thus the water is thereby unlawfully diverted from the Laramie River and its tributaries into the Cache La Poudre watershed for the irrigation of lands in Colorado, contrary to and in violation and disregard of the terms of the said decree of this Honorable Court; and that such unlawful diversions of water from the watershed of the Laramie River into the watershed of the Cache La Poudre River by means of and through the said Bob Creek Ditch have been in the following quantities, to-wit:

(1) In the year 1922, 512 acre-feet;
(2) In the year 1923, 1174 acre-feet;
(3) In the year 1924, 0 acre-feet;
(4) In the year 1925, 745 acre-feet;
(5) In the year 1926, 0 acre-feet;
(6) In the year 1927, 1044 acre-feet;
(7) In the year 1928, 535 acre-feet;
(8) In the year 1929, 1153 acre-feet;

and that in addition to said quantities of water so unlawfully diverted as hereinabove alleged, the defendant State of Colorado, through its officials, agents and servants, and by and with the knowledge, consent and cooperation of said State of Colorado and its officials, agents and servants, was, on the 17th day of June, A. D. 1932, diverting and permitting to be diverted from the watershed of the Laramie River

into the watershed of the Cache La Poudre River through said Bob Creek Ditch, water at the rate of 6.06 cubic feet per second;

That there is also an unfinished extension ditch to said Bob Creek Ditch;

3. The Columbine Ditch is located in sections twenty-six and thirty-five, township ten north of said range, in the State of Colorado; that the length of the ditch is one and three-tenth (1.3) miles; that the ditch has an average cross section of four-foot bottom, six feet at water level, with a depth of two feet, and a slope of five feet per mile; that its approximate carrying capacity is thirty second feet; that its source of supply is Columbine Creek or a branch of it, being tributaries of the Laramie River; that the greater part of the water being carried by it is the early run-off; that the water from the said Columbine Ditch is discharged into a branch of the North Poudre River, and thence into the Poudre River watershed, for the irrigation of lands in Colorado, contrary to and in violation and disregard of the terms of the said decree of this Honorable Court; that such unlawful diversions of water from the watershed of the Laramie River into the Cache La Poudre River by means of and through the Columbine Ditch, have been in the following quantities, to-wit:

(1) In the year 1922, 181 acre-feet;
(2) In the year 1923, 332 acre-feet;
(3) In the year 1924, 0 acre-feet;
(4) In the year 1925, 259 acre-feet;
(5) In the year 1926, 0 acre-feet;
(6) In the year 1927, 376 acre-feet;
(7) In the year 1928, 373 acre-feet;
(8) In the year 1929, 590 acre-feet;

and that in addition to said quantities of water so unlawfully diverted as hereinabove alleged, the defendant

State of Colorado, through its officials, agents and servants, and by and with the knowledge, consent and cooperation of said State of Colorado and its officials, agents and servants, was, on the 17th day of June, A. D. 1932, diverting and permitting to be diverted from the watershed of the Laramie River into the watershed of the Cache La Poudre River through said Columbine Ditch, water at the rate of 4.02 cubic feet per second.

4. The Lost Lake system is composed of five lakes: Lost Lake, Laramie Lake, Lily Lake, and the Twin Lakes; but that three of such lakes only are used for storing water, to-wit: Lost Lake, Laramie Lake and Lily Lake; their capacity being 806 acre-feet of water:

(1) Lost Lake, which is located in the northeast quarter of section six, in township seven north of said range, and in the southeast quarter of section thirty-one in township eight north of said range;

(2) Laramie Lake, which is located in the northwest quarter of the southwest quarter, and the southwest quarter of the northwest quarter of section thirty-two, in township eight north of said range; that a ditch has been constructed in order that the water from the Laramie Lake will flow into Lost Lake, and thence into Chambers Lake situated at the head of the Cache La Poudre River, into which river it flows;

(3) Lily Lake, which is located near the center of section twenty-nine, in township eight north of said range; that the water from Lily Lake flows down a natural channel to Laramie Lake;

(4) Twin Lakes, which are located in the northwest quarter of section twenty-nine, in township eight north of said range; that such lakes have no dike to hold water as the other three lakes of the Lost Lake system have; but a ditch has been constructed to drain these

lakes which flows into a natural channel into Laramie Lake;

(5) That the sources of supply of said Lost Lake system are unnamed tributaries of the Laramie River; and that the water flows therefrom into said Chambers Lake; that all the water stored in these lakes would flow into the Laramie River if the dams and ditches did not cause the water to flow into Chambers Lake, thence into the Cache La Poudre River; and thus the water is thereby unlawfully diverted from the Laramie River and its tributaries into the Cache La Poudre watershed for the irrigation of lands in Colorado, contrary to and in violation and disregard of the terms of the said decree of this Honorable Court; and that the only record of the water diverted by the officials of Colorado shows that in the year 1926, 448 acre-feet were thus unlawfully diverted;

(6) That the State of Colorado, by its officials, agents, and servants, and by and with the knowledge, consent and cooperation of said State of Colorado and its officials, agents and servants, was, on the 17th day of June, A. D. 1932, through and by means of Lost Lake, Laramie Lake and Lily Lake, being three of the five lakes constituting the Lost Lake System, unlawfully storing in said lakes, the waters collected from the watershed of the Laramie River with the purpose and intent to divert said stored waters from said lakes into Chambers Lake Reservoir and thence into the Cache La Poudre River.

5. The Wilson Supply Ditch, sometimes referred to as the Deadman Feeder Ditch, has its headgate in the southeast quarter of section fifteen, township ten north of said range; and runs in a northwesterly course; is one and three-

tenths (1.3) miles long, with a five-foot fall per mile; has a cross section of eight-foot bottom, three feet depth of water, thirteen feet across at water level, carrying capacity of approximately one hundred and thirty second-feet; its main source of water is Deadman Creek or a tributary to it; and the water flows through this ditch into Sand Creek, and from Sand Creek is diverted by the Divide ditch into Sheep Creek, a tributary of the North Cache La Poudre River, which flows into the Cache La Poudre River, for the irrigation of lands in Colorado;

6. The Deadman Extension Ditch is an addition to the Wilson Supply Ditch, sometimes referred to as the Deadman Feeder Ditch, running to the south to intercept several small streams; that it extends from the Wilson Supply Ditch in the southwest quarter of section fourteen, in township ten north of said range, in a general southerly direction through the east half of section twenty-two and the west half of section twenty-three, diverting water from two small streams in the west half of said section twenty-three; and the ditch is extended a short distance beyond the point where the water is diverted in the southwest quarter of said section twenty-three.

7. That an examination of said Deadman Extension ditch in 1929 disclosed that a survey of the ditch had been made for an enlargement; the slope stakes being set for enlarging the ditch from a three-foot bottom to a six-foot bottom; that the point where the enlargement stakes were set was north thirteen degrees east six hundred feet from the southwest corner of section fourteen, in township ten north of said range; thence in a southwesterly course thirty-two hundred feet; thence in a southeasterly course about twenty-four hundred feet to a branch of Deadman Creek; passing through the southwest quarter of the southwest quarter of section fourteen; thence through the southeast

quarter of the southeast quarter of section fifteen; thence through the northeast quarter of section twenty-two, ending in the southwest quarter of the northwest quarter of section twenty-three; all in said township ten north of said range;

8. That an enlargement based on such survey was made in the fall of 1929; and in 1930 it was disclosed that said ditch had been recently constructed to a six-foot bottom; that the ditch can, as reconstructed and enlarged, carry a two-foot depth of water with a two-foot freeboard; that the slope or fall per mile is approximately five feet; that the ditch is capable of carrying forty-eight second feet of water; that part of the ditch carrying water last year has not been enlarged this year.

FIFTEENTH

That in and by the decree of this Honorable Court, as heretofore alleged, it was provided that said decree should not prejudice the right of the State of Colorado, or of any one recognized by her as duly entitled thereto, to continue to exercise the right then existing and thereby recognized to divert and take from such stream (Laramie) and its tributaries the relatively small amount of water appropriated from the headwaters of Deadman Creek, a Colorado tributary of the Laramie River, prior to the year 1902, by and through what is designated in the evidence as the Wilson Supply Ditch; that prior to the year 1902, neither the defendant State of Colorado, nor anyone claiming under the laws of the State of Colorado, had an existing and lawful appropriation of water from the headwaters of Deadman Creek, a Colorado tributary of the Laramie River; and prior to the year 1902, neither the defendant State of Colorado, nor anyone claiming to be recognized by her as duly entitled thereto, diverted any water from said Deadman

Creek or any other recognized tributary of said Laramie River through said Wilson Supply Ditch; that there was not prior to the year 1902, and there is not now, an existing lawful appropriation of the waters of said Deadman Creek by and through said Wilson Supply Ditch into Sand Creek and thence into the Divide Ditch; that plaintiff, because no records are available to plaintiff showing the exact quantities of water diverted in Colorado by and through the Wilson Supply Ditch into Sand Creek, therefore, on information and belief, alleges the fact to be that said Wilson Supply Ditch, as a means of so diverting water from said Deadman Creek, has, as hereinbefore alleged, been enlarged and the capacity thereof increased and that by means thereof, continuing and additional quantities of water have been diverted during the twenty-five years last past from said Deadman Creek and from the area of said Laramie River watershed affected by said Wilson Supply Ditch in addition to the waters of Deadman Creek, that the defendant was, on the 20th day of June, A. D. 1932, by and through its officers, agents and servants, and with the defendant's knowledge, consent and cooperation, diverting and permitting to be diverted by and through the Sand Creek System, (including the Wilson Supply and Divide Ditch) the entire flow of said waters (approximately 43.75 cubic feet per second) of said Sand Creek in Colorado above the point of diversion from said Sand Creek into the Divide Ditch, thence through Sheep Creek into the Cache La Poudre Valley, including approximately, 25.02 cubic feet of water per second from the Laramie River watershed, including said Deadman Creek, through and by means of said Wilson Supply Ditch, and thus preventing any of the waters of said Sand Creek continuing in said stream to flow into the State of Wyoming for the benefit of those lawfully entitled to the use thereof in Wyoming; and that the water so unlawfully di-

verted by and through said Wilson Supply Ditch from the watershed of the Laramie River, constitutes a part of the 272,500 acre-feet which this Honorable Court found available for the irrigation of land within the State of Wyoming, and that said diversions by and through said Wilson Supply Ditch have contributed to the fact that Wyoming and its water users have been unable to obtain from said Laramie River, the amount of water, namely, 272,500 acre-feet, which this Honorable Court decreed was her equitable portion of said waters to be obtained in the manner as by said Court directed.

SIXTEENTH

That there are pending at this time in the district court of Larimer County, Colorado, applications filed July 12, 1926 on behalf of the Water Supply and Storage Company, as owner, of said Laramie Lake, Lost Lake and Lily Lake, referred to therein as reservoirs, for the purpose of having decreed to said owner, authority under the laws of Colorado, to divert and store water for irrigation purposes in said reservoirs; in the amount and capacity in the petitions filed therein set forth; the petitions alleging further that said Laramie reservoir has an area of forty-seven acres, and an estimated capacity of 14,817,744 cubic feet of water; that said Lost Lake reservoir has an area of twenty-six acres, and an estimated capacity of 12,541,030 cubic feet of water; that said Lily Lake reservoir has an area of fifty-nine and five-tenths acres, and an estimated capacity of 7,747,189 cubic feet of water;

SEVENTEENTH

That there is also pending in the said district court of Larimer County, Colorado, the application filed July 12, 1926 of the Mountain and Plains Irrigation Company, owner of the Bob Creek ditch, for the purpose of having decreed to it an adjudication of priority to waters to be diverted from the Laramie River Basin by means of said Bob Creek ditch diversion, sometimes known as Nunn Creek ditch; said petition alleging as follows: That said ditch begins in section three and ends in section two, in township nine north of said range; that it is eight thousand one hundred and thirty feet (8130) long, with a carrying capacity of one hundred cubic feet per second of time; that as a part of said Bob Creek ditch, a feeder ditch was constructed, located in said section two; and also that the Bob Creek Extension ditch across the channel of said Bob Creek, also sometimes known as Nunn Creek ditch, is completed to a distance of approximately six thousand feet, and has a carrying capacity of fifty cubic feet per second of time; and that said Bob Creek ditch and said Bob Creek Extension ditch are used for the irrigation of agricultural lands in the counties of Larimer and Weld in the State of Colorado, the number of acres not being alleged; and that said applications for said decrees are now pending before referees.

EIGHTEENTH

That a corrected topographical map of the watershed of the Laramie river and its tributaries in Colorado, showing the location of the diversions, described herein, is attached hereto, marked "Exhibit A" and hereby expressly made a part hereof;

NINETEENTH

That officials of the State of Wyoming, charged with the supervision of the waters of the state and of their appropriation, diversion and distribution, have conferred with like officials of the State of Colorado, and have protested orally against such excessive or otherwise unlawful diversions of water from the Laramie River and its tributaries in Colorado, for the irrigation of lands in Colorado, contrary to and in violation and disregard of said decree of this Honorable Court; but such officials of Colorado have denied that any such excessive or otherwise unlawful diversions existed; and that such officials in Wyoming further protested in writing to the said officials of Colorado against such excessive and otherwise unlawful diversions; and such officials of Colorado replied in writing that they were unable to find that Colorado or her citizens had violated the decree of this Honorable Court, and were at all times willing and anxious to abide by the terms thereof, and requested a conference of such officials, which was accordingly held on September 26th, A. D. 1930; and that at such conference the assertion on behalf of Wyoming, of such excessive and otherwise unlawful diversions of water by and on behalf of Colorado, as herein alleged, was denied by and on behalf of Colorado; and that, therefore, your complainant is without relief from such excessive and otherwise unlawful diversions of water, except through and by the order, judgment and decree of this Honorable Court.

TWENTIETH

That furthermore, the State of Colorado, unless restrained by this Honorable Court, will, through its officials, agents, representatives, servants, or other citizens or residents, or its corporations, continue to increase the diversion

of water from the Laramie River and its tributaries for the irrigation of lands in Colorado; and unless restrained, will continue until the amount of water determined by the decree of this Honorable Court as being available to Wyoming for the water users in Wyoming, to-wit: 272,500 acre-feet, will be gradually reduced and finally consumed, and Wyoming and its citizens, residents and corporations will be deprived of any protection under the said decree to the use of the waters to which it was determined by said decree to be entitled, and that annually since the entry of said decree, the amount of water available to the State of Wyoming for its water users has been less than said 272,500 acre-feet of water per annum; caused by reason of said excessive and otherwise unlawful diversions;

TWENTY-FIRST

Your complainant, the State of Wyoming, offers to do full and complete equity to the State of Colorado in respect to the administration, diversion and use of the waters of the Laramie River and its tributaries; but this complainant alleges that no other court than this Honorable Court, upon the general doctrines of law, or the constitution of the United States, or under the specific adjudication and decree and the governing principles set forth in the said case of Wyoming vs. Colorado, et al., has any authority or jurisdiction whatsoever to adjudicate upon the matters which were adjudicated in said decree in said case; and furthermore, that Colorado, and through it, its officials, agents, representatives, servants, and other citizens and residents, and its corporations, should be required by this Honorable Court to abide by the terms of said decree, and be prevented by this Honorable Court from any violation of the terms thereof.

TWENTY-SECOND

Your complainant has no adequate remedy at law, nor any remedy at law, nor any remedy in any court whatsoever except this Supreme Court of the United States, in respect to the matters and things herein set forth and alleged.

Second Cause of Action

The State of Wyoming by William O. Wilson, Attorney General of the State, under the direction of the Honorable Frank C. Emerson, Governor of the State, and in compliance with the request of the Honorable John A. Whiting, State Engineer of the State and its Commissioner charged with authority in relation to interstate streams, by leave of this Honorable Court first had and obtained, brings this its original bill of complaint, in its own behalf and that of its officials, agents, servants, and other citizens, residents and corporations, against the State of Colorado, in its own behalf, and that of its officials, agents, servants, representatives and other citizens, residents and corporations, and respectfully and fully sets forth and alleges as and for its second cause of action, and permission having been granted by the Honorable Supreme Court of the United States so to do, claimant now, through its Attorney General, James A. Greenwood, files this, its amended bill of complaint:

FIRST

Complainant refers to all matters and things alleged and set forth in paragraphs numbered first to twenty-first, both inclusive, of this petition, and makes all of the said matters and things alleged in said paragraphs numbered first to twenty-first, both inclusive, of said first cause of action, a part of this its second cause of action, with the same effect and to all intents and purposes, as though herein specifically set forth and alleged.

SECOND

That the State of Wyoming made request on March 8, 1928, in writing, of the State of Colorado for permission to install measuring devices in order to make an inventory of such waters in Colorado, jointly with Colorado and with the United States Geological Survey, such inventory to be made by Wyoming, at its own expense; but that this request was denied in writing on April 5, 1928, by the State of Colorado, and that by reason of such refusal, Wyoming, with a greater interest than Colorado in the said waters of the Laramie River watershed, by virtue of the said decree of this court, is compelled to rely on the measurements made by Colorado.

THIRD

That, therefore, the State of Wyoming should be permitted by means of the order of this Honorable Court, to install gauging devices in the State of Colorado, in the Laramie River and its tributaries and in any transmountain ditches, lakes and reservoirs by means of which water is being or may be diverted from said Laramie River and its tributaries in the State of Colorado to the Poudre River basin; and to take any and all measurements therefrom for the purpose of ascertaining the amount of water being appropriated and diverted from said Laramie River and its tributaries, for the irrigation of lands in Colorado, or that such installation of gauges, and measuring of such waters should be carried on by the Federal Government, at the expense of the said states.

FOURTH

Your complainant, the State of Wyoming, offers to do full and complete equity to the State of Colorado in respect to the matters and things in this cause of action alleged.

FIFTH

Your complainant has no adequate remedy at law, or any remedy at law, nor any remedy in any court whatsoever except this Supreme Court of the United States in respect to the matters and things herein set forth and alleged.

WHEREFORE the State of Wyoming prays as to its first and second causes of action herein that this Honorable Court summon the State of Colorado, as defendant to appear herein, present its answer, if any, and abide by the determination of this Court; and that this Honorable Court may exercise its sole jurisdiction over the determination of the use of the waters of the Laramie River and its tributaries, and protect and quiet the rights of the State of Wyoming, its officers, agents, representatives or other citizens and residents, and its corporations, under the adjudication and decree in said case of Wyoming vs. Colorado, et al.; and that the State of Wyoming be permitted to install standard gauging devices, and take any and all such requisite measurements of water, and make records thereof, as heretofore alleged; and that this Honorable Court direct the installation of necessary gauging devices for the recording of all waters diverted from the Laramie River under authority of the decrees of this Honorable Court; and that said gauging and measuring devices be supervised, maintained and operated under the direction, authority and control of the Federal Government; and that this Honorable Court prohibit any diversions of water from the Laramie River and its tributaries in excess of the quantities annually authorized to be diverted under the terms of said decrees; and that all diversion works and structures heretofore constructed in the State of Colorado for the diversion or storage of water on the Laramie River watershed other than for the diversion of the recognized appropriations, be ordered abated and said means of diversion and storage be ordered

removed; that the said State of Colorado, and through it or otherwise, as the court may determine, its officers, agents, representatives or servants, or other persons or citizens and its corporations, be permanently enjoined from diverting any water from said Laramie River and its tributaries in Colorado, for the irrigation of lands in Colorado, in excess of the quantities of water allotted to Colorado in and by the terms of said decrees; or from further adjudication thereon in the Courts of Colorado; and that this Honorable Court give and grant such other full, further, or different relief as may be just and equitable.

THE STATE OF WYOMING

By JAMES A. GREENWOOD,
Attorney General of the State of Wyoming.

RICHARD J. JACKSON,
Deputy Attorney General of the State of Wyoming.

GEORGE W. FERGUSON,
Assistant Attorney General of the State of Wyoming.

R. DWIGHT WALLACE,
Assistant Attorney General of the State of Wyoming.

Solicitors for Complainant.

THE STATE OF WYOMING }
COUNTY OF LARAMIE } ss.

JAMES A. GREENWOOD, being duly sworn on his oath according to law, deposes and says: That he is the Attorney General of the State of Wyoming, and as such, at the direction and upon the request of the Acting Governor of said State, and upon the request of the State Engineer and Commissioner for Wyoming, exhibits the foregoing amended bill of complaint; that he has read said amended bill of complaint and that the facts therein set forth, saving and excepting those averred on information and belief, are true; and that as to the facts therein alleged as upon information and belief, affiant is credibly informed and verily believes that said facts are true.

JAMES A. GREENWOOD

Subscribed in my presence and sworn to before me, this 22nd day of June, A. D. 1932.

My commission expires December 10, 1933.

W. S. FORSYTH,
Notary Public.

THE STATE OF WYOMING,
Complainant,
vs.
THE STATE OF COLORADO,
Defendant.

NOTICE.

TO:

The State of Wyoming, the Complainant herein, and the Honorable James A. Greenwood, Attorney General of said State and Solicitor for said Complainant:

YOU WILL PLEASE TAKE NOTICE that at the incoming of the Supreme Court of the United States at the hour of 12:00 o'clock M. in the Capitol Building in the City of Washington, District of Columbia, on Monday, April 6, 1931 or as soon thereafter as Solicitors can be heard, the above named defendant will appear by its solicitors, ask leave to file a motion to dismiss the complaint; a copy of which Motion to Dismiss, together with a copy of the Brief in support there-

of is herewith served upon you. When and where you may be present if you so desire.

CLARENCE L. IRELAND,
Attorney General of the State of Colorado,
CHARLES ROACH,
Deputy Attorney General,
FRED A. HARRISON,
Assistant Attorney General of the State of Colorado,
Attorneys for Defendant.

State of Wyoming, County of Laramie, ss.

Service of the above Notice by delivery to me of a copy thereof, with a copy of the aforesaid Motion to Dismiss and Brief in support, is hereby acknowledged this .... day of April, 1931.

JAMES A. GREENWOOD,
Attorney General of the State of Wyoming and Solicitor for Complainant.

Supreme Court of the United States

OCTOBER TERM, 1930.

IN EQUITY

No. 20, Original

THE STATE OF WYOMING, *Complainant,* vs. THE STATE OF COLORADO, *Defendant.*	MOTION TO DISMISS

Comes now the State of Colorado by its undersigned attorneys and respectfully moves that the Court do now dismiss the pending bill of complaint and each count thereof for want of equity apparent on the face of said bill, and for that the said bill does not state facts warranting the granting of the relief therein sought, or any relief, for the following reasons:

I.

That this Court has no jurisdiction of either the parties to or the subject matter of this suit, because it appears on the face of said bill of complaint that the matters set forth therein do not constitute, within the meaning of the constitution of the United States, any controversy between the State of Wyoming and the State of Colorado.

II.

That although the present bill purports to be supplemental to the bill filed in this Court in case No. 3, Original, State of Wyoming v. State of Colorado, and to have as its object the enforcement of the final decree entered by this Court in said suit, it fails sufficiently or at all to disclose any reason why any further decree is necessary to enforce said former decree, since the allegations of the present bill fail to show with certainty any violation of the provisions of said decree, and the allegations as to the supposed excessive diversions in the year 1926, through the Laramie-Poudre tunnel, are ambiguous and insufficient, and because if such alleged excessive diversions were made then the State of Wyoming has been and is guilty of laches in the premises.

III.

That the bill of complaint fails to show damage suffered by complainant or by its citizens with respect to any diversions alleged in said bill of complaint to have been unlawfully or excessively made.

IV.

That the allegations in Paragraphs 8 and 10 of the bill of complaint in support of the prayer for the installation by complainant of gauging devices and instruments in Colorado do not show that there is any uncertainty or difficulty in the ascertainment of the quantity of water diverted or carried through and by means of the Laramie-Poudre appropriation and tunnel, but said allegations have reference to other diversions not adjudicated or determined in and by the final decree of this Court in said former suit.

V.

That although the bill of complaint purports to be a supplemental bill for the enforcement of the former decree of this Court, in the case of State of Wyoming v. State of Colorado, it seeks greatly to extend the scope and effect of the decree entered in said case, to the end of undertaking a complete ad-

judication of the rights to the use of water from the Laramie River, under an asserted claim that as against the rights of water users in the State of Colorado, the priority of right of Wyoming appropriators as a class has been finally determined to be 272,500 acre-feet of water per annum, which asserted claim is without merit as does appear from the inspection of the record, opinions and decisions of this Court found in 259 U. S. 419 and 259 U. S. 496.

VI.

That said bill invites a construction of the former decree and seeks thereunder to extend the scope thereof to the adjudication of rights not therein litigated or determined, whereas said decree is not susceptible of such construction and no facts are alleged in support of the claimed interpretation of said decree, and such construction is inhibited by the 5th Amendment to the Constitution of the United States.

VII.

That the bill is multifarious in this, to-wit, that thereby the State of Wyoming seeks (1) a supplemental decree to enforce and carry into effect the decree heretofore renderd by this Court in said case No. 3, Original; (2) the claims of the State of Wyoming in its sovereign capacity and as representative of the separate and several claims of numerous undisclosed Wyoming appropriators of water against the separate and several claims of the numerous undisclosed Colorado appropriators of water; (3) to obtain relief with respect to alleged excessive diversions through and by means of the Laramie-Poudre diversion and tunnel in the year 1926; and (4) to obtain ancillary relief with respect to the installation, maintenance and inspection of certain gauging devices for measurement of water diverted and carried by means of all transmountain ditches and reservoirs.

VIII.

That it appears from the face of said bill that the acts complained of are not done by the State of Colorado nor under its authority, but by certain private corporations and individuals

with respect to whom relief is sought against the State of Colorado, and no decree which might be herein rendered would be efficacious to affect the vested rights of such corporations and individuals.

IX.

That said bill of complaint is in other respects uncertain and insufficient and does not state facts sufficient to entitle the said State of Wyoming to the equitable relief prayed for.

CLARENCE L. IRELAND,
Attorney General of the State of Colorado,
CHARLES ROACH,
Deputy Attorney General,
FRED A. HARRISON,
Assistant Attorney General of the State of Colorado,
Attorneys for Defendant State of Colorado.

HE STATE OF COLORADO,
Defendant.

Brief on Motion to Dismiss.

INTRODUCTION.

(Wyoming vs. Colorado, 259 U. S. 419, 260 U. S. 1)

The present suit is intimately connected with the above decision, is supplemental thereto and seeks enforcement of the decree rendered by this Court.

By reason of the nature of the present complaint it will be necessary for the Court to take cognizance of the pleadings, evidence, arguments and decree in the former proceeding.

It is our contention that the suit mentioned was concerned solely with the prayer of the State of Wyoming for an injunction prohibiting the diversion of any of the waters of the

15,500 acre-feet. This allegation is on information and belief, and it is stated that, according to an official record, this diversion amounted to 13,572 acre-feet and that there were additional "unreported diversions" in the amount of over 3,000 acre-feet; however, that the records of the Division Engineer certified to by him show a diversion of 5,644 acre-feet instead of 13,572 acre-feet of water.

This Ninth paragraph contains the only allegations in the complaint which undertake to charge a violation of the specific terms of the former decree. It will be noted that the averments are ambiguous and uncertain in character and by the Nineteenth paragraph of the complaint it is made to appear that the officials of the State of Colorado charged with supervision over the diversion and distribution of water have denied that any unlawful or excessive diversions of water were in fact made.

We consider that this Ninth paragraph does not measure up to the requirement of a clear and convincing charge of violation of the former decree.

Under Section 1838, Compiled Laws of Colorado, 1921, the Water Commissioner is required to make reports to the Superintendent of Irrigation of his division (now called "Division Engineer").

The immediate control over the Water Commissioner is vested in the Division Engineer, and the record of a Division Engineer as certified to by him, should be regarded as being prima facie correct.

The inference of this paragraph is, that the complainant has no independent belief in the premises, but is making the charge on the sole basis of finding a so-called "official record" in the office of the State Engineer, which is based on the record of the Water Commission of the district. The district is not stated.

The duty is cast upon the Water Commissioner of the district in which the water is used, to keep a record of the amount of water turned into his district from any other district (Sec.

1704 C. L. 1921). The district in which the water is diverted is No. 48 and the district in which it is used is No. 3. In event of discrepancy, it would appear to be the duty of the Division Engineer to investigate and arrive at a conclusion as to the true fact.

Aside from this consideration, the record in the office of the State Engineer, according to the allegation made, shows a diversion of 13,572 acre-feet, which is well within the permitted amount.

While there is a reference to additional "unreported diversions", the pleader fails to state who made these diversions, and fails to allege the facts upon which it is justified in asserting that these "unreported diversions" were in fact made.

The "Skyline Ditch", the property of the Water Supply & Storage Company, carries its water supplies by means of an open ditch around the mountain, and the tunnel appropriator diverts its supplies through the mountain.

For aught that appears from the charge, if the "unreported diversions" were in fact made, this may have been done under arrangements between the two owners, whereby the Water Supply & Storage Company was permitted by the Tunnel owner temporarily to use that conduit.

Compainant bases "belief" solely on the records, but alleges nothing to show that it was entitled to believe the record of 13,572 acre-feet rather than the record of 5,644 acre-feet, nor is it disclosed whether the "unreported diversions" were made under claim of right or otherwise.

The Tenth paragraph states that by the decree the plaintiff was found to be entitled to an amount of water from the river far in excess of the amount to which the State of Colorado was entitled; therefore, having a vital interest in the appropriation, diversion and measurement of the waters of the Laramie River and its tributaries in Colorado, should be permitted to install its own standard gauging devices and make its own measurements in Colorado, yet that the defendant,

though requested in writing by the complainant for such permission, denied such request.

This paragraph is to be read in connection with the Eighth paragraph, which charges, upon information and belief, that the gauges installed by defendant do not accurately measure the full amount of water diverted.

It is not, however, indicated in what manner the plaintiff has reached the conclusion that these gauges are inaccurate.

Under Section 1703, C. L. (Colo.) 1921, an appropriator transferring water from one public stream to another is required to construct and maintain, under the direction of the State Engineer, flumes or weirs and self-registering devices at the point where the water leaves its natural watershed and is turned into another and also at the point where it is finally diverted for use from the public stream. These automatic devices exist—at least their existence is not denied by the bill. Having regard to the presumption of regularity and honesty, which attends official acts, it would appear that the plaintiff, in attacking the correctness of the gauges, should set forth the facts why they are under suspicion. It is not claimed that there has been any refusal on the part of defendant to permit access to these self-registering devices or to make any investigations required to reach a determination regarding their correctness.

The Tenth paragraph is to be read in connection with the Second Count, and it contains merely the flat assertion that, by reason of the extent of complainant's interest, it ought to be permitted to install its own gauges. This was not thought to be necessary in 1922 at the time of drafting of the former decree, and, if anything has since transpired indicating that Wyoming has been prejudiced by reason of its not possessing check gauges, these facts should be alleged.

Paragraphs Eleven to Fifteen, inclusive, deal with certain alleged excessive or unlawful diversions.

Paragraph Twelve refers to "the 18,000 acre-feet of water being the amount *authorized* • • • to be diverted under

said decree * * * by said Skyline Ditch" (the property of the Water Supply and Storage Company), and it is then said that, in 1927, 4,150 acre-feet were taken in excess of the annual amount of water *authorized by said decree thus to be diverted*— in 1928, 1,397 acre-feet and, in 1929, 6,363 acre-feet.

By the Thirteenth paragraph a similar complaint is made as to the so-called "meadow" appropriators.

By the Fourteenth paragraph the defendant is charged as having permitted "unlawful and/or excessive trans-mountain diversions of water to be made from the Laramie River and its tributaries in Colorado through the Bob Creek Ditch; Lost Lake Reservoir System; Columbine Ditch, the Deadman Ditch Feeder or Wilson Supply Ditch; the Divide Ditch, and the Deadman Extension Ditch; to the watershed of the Cache la Poudre River for the irrigation of lands in Colorado, *contrary to and in violation and disregard* of the terms of said decree * * *."

It is then shown that there were diversions by the Bob Creek Ditch in the year 1922 of 512 acre-feet, and in subsequent years varying volumes of water ranging from zero in the years 1924 and 1926 to 1,174 acre-feet in 1923 and concluding with the year 1929, 1,153 acre-feet.

Similar charges are made as to the Columbine Ditch which is said to have diverted 181 acre-feet in the year 1922 with varying quantities in the succeeding years, except that in the years 1924 and 1926 there was no diversion.

Next it is said that Lost Lake, Laramie Lake and Lily Lake, being a part of the Lost Lake System, are used for storing water, their capacity being 806 acre-feet of water; that by means of these reservoirs waters are unlawfully diverted from the Laramie River into the Cache la Poudre River—the only record of the water diverted by the officials of Colorado showing that, in the year 1926, 448 acre-feet were thus unlawfully diverted.

It is next stated that the Deadman Extension Ditch, being

an extension of the Wilson Supply Ditch, has been in part enlarged "from a three foot bottom to a six foot bottom," but it is not alleged that this enlargement will divert a greater quantity of water than the original ditch.

Subsection 8 of paragraph Fourteen states: "That part of the ditch carrying water last year has not been enlarged this year."

We comment that the portion of the ditch referred to as the Deadman Extension Ditch is merely the central part of the Deadman feeder of the Wilson Supply Ditch. This is approximately 5½ miles long as indicated on the map attached to the complaint, and the part said to have been enlarged is a segment of this. In view of the nature of the allegations here, we feel justified in saying that this so-called enlargement is merely a different formation of the cross-section of a small portion of the ditch, and the carrying capacity was not thereby increased, nor is it intended to be increased.

The Fifteenth paragraph undertakes to state the substance of the provisos of the former decree as modified.

The Sixteenth and Seventeenth paragraphs disclose the fact that the Water Supply and Storage Company, as owner of Laramie Lake, Lost Lake and Lily Lake, has made its application to the District Court of Larimer County, Colorado, for authority, under the laws of the state, to divert and store water for irrigation purposes in said reservoirs—the claim being made for 14,817,744 cubic feet of water for the Laramie reservoir; 12,541,030 cubic feet of water for Lost Lake; and 7,747,189 cubic feet of water for Lily Lake.

Paragraph Sixteenth says nothing as to the dates claimed by this owner as to the vesting of its appropriation in connection with these reservoirs.

There was a reference in the former record to the Lost Lake System. (See the testimony of A. A. Edwards at marginal page 2214 of the transcript, concerning Lost Lake; the testimony of L. G. Carpenter at page 2278, referring to the efforts made as early as 1879, 1880 and 1881 to

bring water from Lost Lake into the tributaries of the Poudre; that of J. L. Armstrong at page 2494, referring to his recollection as to the time when Laramie Lake and Lost Lake reservoirs were constructed.)

The Seventeenth paragraph contains similar allegations directed against the Mountain and Plains Irrigation Company, as owner of the Bob Creek Ditch, showing that this owner has applied for an adjudication of its priority to waters to be diverted from the Laramie River Basin by means of the Bob Creek Ditch. The priority date claimed by this appropriator is not stated. Under the allegations of these paragraphs, plaintiff asks in its prayer that these adjudications should be enjoined. They contain no suggestion that this course is necessary for the protection of the rights asserted. The state adjudications, if made, could not bind the Wyoming appropriators nor the complainant, and it would appear extraordinary in a suit between these states, for this Court to enjoin ordinary judicial proceedings carried on in a court of competent jurisdiction by citizens of defendant state. We apprehend that to permit such action a case of over-riding necessity should be made out, which is not here disclosed.

The Eighteenth paragraph refers to a topographical map of the watershed of the Laramie, showing location of the several diversions described.

Paragraph Nineteenth charges that the water officials of Wyoming have conferred with like officials of Colorado protesting "against such excessive or otherwise unlawful diversions of water from the Laramie River and its tributaries in Colorado, for the irrigation of lands in Colorado, contrary to and in violation and disregard of said decree of this Honorable Court; but such officials of Colorado have denied that any such excessive or otherwise unlawful diversions existed."

Therefore complainant is without relief "from such excessive and otherwise unlawful diversions of water, except

through and by the order, judgment and decree of this Honorable Court."

Paragraph Twentieth states that defendant, unless restrained will, through its officials, agents, representatives, servants, or other citizens or residents, or its corporations, continue to increase the diversion of water from the Laramie River and its tributaries for the irrigation of lands in Colorado; and unless restrained "will continue until the amount of water determined by the decree of this Honorable Court as being available to Wyoming for the water users in Wyoming, to-wit, 272,500 acre-feet, will be gradually reduced and finally consumed, and Wyoming and its citizens, residents and corporations will be deprived of any protection under the said decree * * * and that annually since the entry of said decree, the amount of water available to the State of Wyoming for its water users has been less than the said 272,500 acre-feet of water per annum, caused by reason of said excessive and otherwise unlawful diversions."

The foregoing paragraph Twentieth contains the only allegations tending to show injury or damage, and is largely prophetic in character.

The Twenty-first paragraph states that this Court has the exclusive jurisdiction to adjudicate upon the matters which were determined in the former suit, and that thereupon "Colorado, and through it, its officials, agents, representatives, servants, and other citizens and residents, and its corporations should be required by this Honorable Court to abide by the terms of said decree, and be prevented by this Honorable Court from any violation of the terms thereof."

The Twenty-second paragraph states that the complainant has no adequate remedy at law.

SECOND COUNT.

By the SECOND COUNT all the allegations of paragraphs numbered First to Twenty-first are adopted by reference, and it is thereupon alleged that, on March 8, 1928, the

plaintiff made request in writing for permission to install measuring devices "in order to make an inventory of such waters in Colorado, jointly with Colorado and with the United States Geological Survey," but that said request was denied.

The claim is made that, by reason of the premises, the complainant should be permitted to install gauging devices in the State of Colorado in the Laramie River and its tributaries and *in any trans-mountain ditches, lakes and reservoirs* by means of which water is being or may be diverted from said Laramie River and its tributaries in the State of Colorado to the Poudre River basin.

The allegations of this count are to be read in connection with the Eighth and Tenth paragraphs of the First Count; and it is then disclosed that Wyoming takes the position that, without any allegations showing prejudice to her rights, without any facts being alleged showing that the automatic gauges now in use understate the amounts diverted, without any investigation disclosed as having been made upon which to found a charge of error in the gauges installed, Wyoming is entitled, because of her interest in this stream alone, to install and maintain her own independent meters. No suggestion is made as to solution of disagreements between agents in charge of the respective measuring devices of the two states. An alternative course is, however, suggested that the installation of gauges and measuring of waters should be carried on by the Federal Government.

By the prayer the Court is asked to assume sole jurisdiction; that defendant present its answer and abide by the determination of the Court; that the rights of the State of Wyoming be quieted under the adjudication in said case of Wyoming vs. Colorado, et al.; that Wyoming be permitted to install standard gauging devices, etc.; and "that in event the said court shall find in and by said decree that the injunction entered therein applied only to the diversion by the State of Colorado of the waters through the Laramie-Poudre Tunnel, that this Honorable Court may, temporarily, during the pen-

dency of this cause, and permanently, on the final determination hereof, enjoin the said State of Colorado, and through it or otherwise, as the court may determine, its officers, agents, representatives or servants, or other persons or citizens and its corporations, from diverting any water from said Laramie River and its tributaries in Colorado, for the irrigation of lands in Colorado, in excess of the available quantities of water allotted to Colorado in and by said decree; or from further adjudication thereon in the Courts of Colorado" and for general relief.

MOTION TO DISMISS.

From the above summary it is apparent that the relief sought in this action is primarily against the owners of the Skyline Ditch, the Meadow appropriators and the Wilson Supply Ditch, all of whom were mentioned in the testimony and decision in the original proceeding, but none of whom were parties, and against the owners of the Bob Creek Ditch, the Columbine Ditch and the so-called Lost Lake System, none of whom were mentioned or made parties in the former action.

In this respect it is different from the former suit in which the two Colorado corporations which were seeking to perfect the diversion and appropriation of the water of the Laramie River were joined as defendants and were directly enjoined "from diverting or taking more than 15,500 acre-feet per year from the Laramie River by means of or through the so-called Laramie-Poudre project."

Briefly stated, the motion shows that the facts alleged do not disclose a "controversy" within the meaning of the Constitution; it points out the indefiniteness in allegation as to violation of the former decree; the failure of the bill to show damage; that claims made as to the necessity for gauging devices refer not to the Laramie-Poudre tunnel but to other appropriations, the rights of which were not and could not have been adjudicated in the former suit; that the present complaint, regarded as supplemental to the former decree, seeks without

justification to enlarge the effect thereof to the end of limiting the appropriations which were not in controversy in the former action; that regarded as a bill for construction of the former decree, it claims an interpretation which would make the decree conclusive on the rights of all appropriators in Colorado without regard to the actual relative priorities of these appropriators and those of Wyoming, and the decree is not and could not under "due process" be susceptible to such construction; that the bill is multifarious—being

(1) one for enforcement of the former decree; (2) for the general adjudication of all Wyoming as against all Colorado appropriations of the waters of the Laramie River; (3) for relief as to certain claimed excessive diversions through the Laramie-Poudre tunnel in 1926; (4) for ancillary relief as to the installation of gauging devices for the measurement of water diverted by trans-mountain ditches and reservoirs; that the bill discloses that acts charged to have been committed, viz., excessive or claimed "unlawful" diversions were made by persons other than the owners of the Laramie-Poudre tunnel appropriation, and as to such persons any decree to be rendered in the present suit would be inefficacious, since their rights were not drawn in question in the former suit, and any action now to be taken to make these rights subject to the decree of 1922 on the basis of the record in said suit would be without due process and in conflict with the Fifth Amendment to the Constitution of the United States.

This motion is directed to both counts of the complaint.

The rights asserted under the second count grow out of the facts alleged in the first count; and in the discussion of the Motion to Dismiss it is not considered to be necessary separately to treat these different causes of action.

ARGUMENT.

The complaint presents the defendant as having violated and disregarded the decree of this Court rendered in the former suit. Some of its allegations are those of a bill for enforcement of the former decree—some seek a construction of the former decree to the end that it be now determined that diversions made other than that made from the Laramie River by means of the Laramie-Poudre are subject to the force and effect of such former decree so that, for illustration, the so-called "Skyline" ditch diversion is limited perforce of said decree to a maximum of 18,000 acre-feet per annum in like manner as if the owner of said ditch and water right had been a party to the former suit and had been specifically thereby enjoined from diverting any water in excess of the permitted amount.

The complainant, however, is not willing, on this aspect of its case, to ground its claim solely upon the basis that the former decree was effective to define and limit all other diversions in Colorado taking water from the Laramie, in addition to enjoining the diversion by means of the tunnel, for by its prayer it asks for additional relief in the event the Court "shall find in and by said decree that the injunction entered therein applied only to the diversion by the State of Colorado of the waters through the Laramie-Poudre tunnel."

In this event a temporary injunction is sought to restrain diversions of "any water from said Laramie River and its tributaries in Colorado for the irrigation of lands in Colorado in excess of the available quantities of water *allotted to Colorado in and by said decree.*"

The idea expressed by the bill under this aspect is that, by the decree as modified (260 U. S. 1), which was expressly made without prejudice to the right of the State of Colorado to continue to exercise rights of diversion thereby recognized to take certain quantities of water by means of stated diversions and appropriations, thereby such appropriations and diversions were effectively limited to the conceded and recognized amounts. If, however, the Court should disagree with this

contention and hold that the decree as modified did not produce that result, and the matter was not thereby finally adjudicated to the end of limiting the rights of all "others", then that the Court, with respect to the temporary status, should consider, for the purpose of the showing on the application for the temporary injunction, that the quantities of water referred to in the modified decree should be deemed, until the time of final adjudication, to be the amounts "allotted" to Colorado. Under this concept the "allocation" should continue to govern until such a time as by proof presented by defendant it should be made to appear that the owners of such "other" appropriations of the Laramie waters had been unduly circumscribed in the enjoyment of their vested rights. The burden thus is sought to be imposed upon Colorado to justify any diversions in excess of the amounts which were conceded by Wyoming in the former proceeding, and under the concession, recognized by this Court in the decree as modified. Although the prayer of the complaint thus suggests alternative courses for this Court to follow, and the complainant is presented as unwilling to abide the result of the determination of the single issue whether the decrees in question effectively limit and enjoin appropriators other than the tunnel appropriators, and desires, in event that issue shall be determined adversely to its contention, to prosecute further to the end of obtaining a determination that these others must not exceed the conceded and recognized amounts, yet no facts are alleged to show that appropriators in Wyoming are justly entitled to this result. There are no allegations in the bill touching the dates of the several appropriations perfected in the State of Wyoming which are supposed to be prior in right to the appropriators in Colorado other than the tunnel appropriator, and the prayer in this connection is simply that, upon the final hearing, these other appropriators shall be limited to the amounts designated in the decree as modified.

The real attitude here is that although it may be that "others" are not now technically bound to abide the decree, yet that they may be effectually drawn into the controversy now,

and upon the existing record, by amendment of the former decree, should be enjoined.

As we understand the position here taken, it is that, due to some oversight in drafting the former decree, it was not made in terms to include an injunction against the several appropriators in Colorado who were owners of the "recognized" water rights, nor was the injunction entered against the state adequate to affect these rights possessed by citizens who are not parties to the former suit. This situation the State of Wyoming considers can now be corrected, and it is faintly suggested in the prayer that this should be done by bringing in other parties, in which action is demanded that this Court "enjoin the State of Colorado, and through it, *or otherwise* as the Court may determine * * * from diverting any water * * * in excess of the available quantities of water *allotted* to Colorado in and by said decree." (Page 27, Complaint.)

So in this view the bill does not seek, upon a disclosure of the facts showing priority of right possessed by the whole body of Wyoming appropriators, or by any one or several of them against the other "Colorado appropriators," to obtain a general adjudication of water rights in this interstate stream, but instead presents the matter to the Court as if the rights possessed by Wyoming may be ascertained and discovered by the Court upon inspection of the whole record in the former suit, and thereupon that the Court should so amend and expand its decree as to bring within its force and effect not only the tunnel diversion which was complained of in the former suit, but, as well, every appropriator in Colorado from the Laramie, regardless of the effective vesting of his title and the relative rights of the several appropriators in the State of Wyoming.

So the bill appears to be one for enforcement of the rights clearly given the State of Wyoming by the former determination, in respect of the injunction against any diversion in excess of 15,500 acre-feet by the tunnel; also to have the Court declare that this former determination was effective not alone

for what the decree said, but also as an adjudication of all interstate controversies respecting the water of the Laramie River: alternatively, if the decree is not susceptible on its face to the construction claimed, then there is sufficient in the record from which that result may be now determined; and that, under the present "original" bill, the Court can properly render a decree to have the effect of modifying and enlarging the scope of the former decree.

The complaint has various and inconsistent aspects: First, as for enforcement of the decree as written; second, as a bill to construe the decree to the end of obtaining a declaration that everything now complained of by Wyoming was fully litigated and determined in the former action; if this determination cannot be reached as a matter of construction of the decree merely, then, as a bill to amend the former decree by enlarging and extending its scope and effect, and if necessary to that end, to bring in additional parties to abide the foreordained result.

There is not a single allegation in the complaint to the effect that any Wyoming appropriator is entitled to prevail because of priority possessed in fact over the Colorado appropriators whose rights are now attacked. All charges are made with reference to the 272,500 acre-feet claimed to have been awarded to Wyoming as a finality, and disregarding the obvious fact that the determination of that amount was confined to the issue presented of the rights of Wyoming appropriators relative to the effective date of vesting of the tunnel appropriation. These rights are prior to that date—October, 1909—but they are not prior to the rights possessed by the Water Supply & Storage Company in connection with its Skyline Ditch, which the record in the former suit discloses was built in 1891, nor are they as a class prior to any other Colorado water right vested prior to 1909, nor is there in the former proceeding any proof from which these relative rights can now be ascertained even if the ambit of the former suit were considered to be sufficient to permit of a general adjudication

of all rights of appropriators from the Laramie River in both Colorado and Wyoming.

A cursory reading of the complaint in the first suit will convince that the plaintiff there had no purpose to draw in question anything other than the then threatened diversion through the tunnel and was perfectly satisfied with the *status quo ante.* Nor is any such purpose now to be discerned in the present bill, save upon the assumption that all Colorado rights other than those of the tunnel, were defined and limited by the decree, and that rights then existing and vested, but not mentioned in the decree, were destroyed because of its silence.

Non constat that if Wyoming is held to be in error in this assumption, it will desire to maintain this suit or file a new bill in equity for such a general adjudication. Its right to act in such supposed suit, as representative of the purely private and individual rights of citizens would be open to grave question, but that is a problem which it is not necessary now to attempt to solve.

Nowhere in the complaint is to be found a specific allegation of injury to the State of Wyoming.

For aught that appears in the complaint every appropriator in Wyoming since the year 1922, when the former decree was rendered, may have obtained ample water supplies to the full extent of his beneficial use. There is a studied effort to abstain from any disclosure of claimed damage.

The only allegations dealing with the effect of the alleged "trespasses" of Colorado are to be found in the twentieth paragraph, in which it is said that the State of Colorado, unless restrained, will continue to increase the diversion of water from the Laramie River * * * and unless restrained will continue until the amount of water determined by the decree of this Honorable Court as being available to Wyoming for the water users in Wyoming, to-wit, 272,500 acre-feet, will be gradually reduced and finally consumed. * * *

This is prophecy merely, and no facts are stated to show the "increase" referred to; it is not alleged that any of the

so-called "unlawful" or "excessive" diversions had their inception on dates subsequent to the commencement of the former suit; nor is it said that the methods of use practiced have been changed in any respect from the methods in vogue before the former suit was instituted.

The diversions by the Bob Creek Ditch and by the Columbine Ditch are characterized as unlawful, but it appears from the allegations of the fourteenth paragraph that these diversions were continuously made since the year 1922 and so rights were asserted in connection therewith at the time of entry of the former decree. There is nothing in the complaint which charges that these diversions are junior in right to any of the Wyoming appropriations, and they are so "unlawful" merely under the claim that any diversion not recognized and permitted by the former decree is such. Similarly with respect to Lost Lake, Laramie Lake and Lily Lake—these lakes had long been in use prior to the taking of evidence in Wyoming vs. Colorado, and it is now claimed that their diversions are rendered unlawful by force of the former adjudication. There is a reference in the thirteenth paragraph of the complaint to an apparent increase in acreage irrigated by means of the so-called "meadow" diversions, but it is not therein stated that this increased the consumptive draft on the stream to the prejudice of complainant, nor that the acreage represents an actual increase over the acreage irrigated prior to the rendition of the former decree. The whole complaint in this connection is with regard to the limitation claimed to have been imposed with respect to these "meadow" appropriations by force of the former decree.

In paragraph fourteen, sub (5), (6), (7) and (8), there is reference to a projected enlargement of the Deadman extension ditch. It is disclosed, however, that this has not been completed, and it is not alleged that, upon the completion of this extension, any more water will be diverted from the stream than has customarily in the past been diverted.

The allegations of the complaint are very weak as to facts

showing the present necessity of the Court's taking cognizance to the end of enforcing the right admittedly possessed by complainant, to limit the tunnel diversion to 15,500 acre-feet. These allegations do not constitute the gravamen of the cause of action. They seem to be incorporated in order to afford a definite basis for the prayer that this Court assume exclusive jurisdiction.

This is to the end of affording an excuse to invite the Court's attention to the problem of construction and extension of the decree which the complainant desires to present.

The plaintiff asserts that the decree already rendered means that the Skyline diversion is now effectively limited to but 18,000 acre-feet per annum, or that it should be so limited upon a reconsideration of the former decree, and similarly with respect to all other of the diversions referred to in the decision. As to diversions not referred to, it is claimed that they are made illegal and subject to be enjoined by reason of the former decree alone.

If this Court should conclude that this is the correct view of the force and effect of its decree, that conclusion would practically dispose of the case, because, it will not be denied by Colorado that at times the Skyline Ditch, for example, has diverted more than 18,000 acre-feet per annum under claim of right, this ditch having been constructed in the year 1891, many years prior to the application of water to the larger portion of the 181,500 acres of land in Wyoming referred to by this Court in its opinion as having rights to 272,500 acre-feet of water prior in time and right to October, 1909. As to the Second Count of the complaint it is not to be assumed that Colorado will decline to permit access to and opportunity to check operation of measuring devices in event it shall be determined by this Court that all other appropriators are bound to abide the decree under the construction claimed by plaintiff, or as amended by the Court expressly to bind them. If orders are considered necessary to cover installation and operations of check gauges by Wyoming they would be incidental to the main relief. So

the "Second Count" is not an independent cause of action but presents merely an aspect of the remedy sought. It stands or falls with the determination of the principal issue.

If Wyoming is not right in the contentions which are now made, we think there is little, if any, difficulty with respect to measurements of the flow through the tunnel, or with respect to any actual excess diversion by means thereof.

The allegation as to such supposed excess diversion is found in the ninth paragraph of the bill. This is on information and belief—it refers only to the year 1926, and the record in the office of the State Engineer showing a diversion of 13,572 acre-feet and some "unreported" diversions in the amount of 3,000 acre-feet. Nevertheless, the records of the Division Engineer, as certified to by him, show a diversion of but 5,644 acre-feet in that year.

The allegations concerning the need of Wyoming to have accurate measurements of the waters of the Laramie River and the diversion thereof refer to the entire stream and to all of the appropriations. It is not charged that there is any inadequacy or error in the gauging devices and measurements of water carried through the Laramie-Poudre tunnel.

If the major contentions of Wyoming were out of the way, we feel very sure that the officials of the two states could readily reach an accord as to the measurements of stream flow and diversions through and by means of the tunnel, and by other appropriators.

If consideration of this bill were confined alone to the allegations concerning excessive diversions through the tunnel, it would appear sufficiently evident that the grievances asserted are not of sufficient moment to enlist the attention of the Court.

The principal purpose of the motion to dismiss is to join issue with the contention of the complainant that the whole matter has already been finally adjudicated by the former decree. The problem so presented is a law question and it is apprehended that this should be determined *in limine.*

If upon the motion it is determined by the Court that the major contention of the plaintiff is untenable, the question thereupon for determination would be whether or not, under the allegations of the complaint, a sufficient foundation in fact had been laid to require the court to undertake a general adjudication of all water rights in Colorado and their priorities as respects the water rights and priorities of appropriators in Wyoming. We say that this would not be required because not in accord with the theory under which the plaintiff presents its case, which is that in any event the determination must be reached either with regard to the decree alone or with regard to the decree sought to be amended in the light of the whole record so as to enjoin all diversions in excess of the "recognized" appropriations.

The major contentions of Wyoming present law issues only, and until those issues are disposed of and the determination is reached as to possible fact issues involved, it would be futile for defendant to tender its answer raising the issues of fact upon which it will predicate its claim that the appropriations under attack are prior in right to the great majority of the several appropriations in Wyoming which were recognized to the extent of 272,500 acre-feet as prior to the Laramie-Poudre tunnel appropriations of date 1909.

If it should be contended that the Motion to Dismiss goes to the whole bill and should not be entertained because the complaint tenders a sufficient issue regarding the necessity of specific enforcement of the decree, our answer would be that the complaint as a whole is founded upon a fallacious theory as to the effect of the decree, and but for this fallacy it is not apparent that Wyoming would desire to prosecute the suit to be founded alone upon the charges as to the supposed excess diversion in 1926 through the tunnel and the necessity for installing gauging devices, especially since as to the latter there is not disclosed any inaccuracy in the measurement of water carried through the tunnel, nor any difficulty confronting the plaintiff in access to the existing

measuring devices installed in connection with all transm. intain diversions.

But if the bill is to be limited to the allegations germane to a suit for enforcement merely, it would not present a controversy of the "serious magnitude" referred to in the decisions of this Court, as a prerequisite to assumption of jurisdiction. (State of Connecticut vs. Commonwealth of Massachusetts. Decision rendered Feb. 24, 1931.)

The bill is not susceptible to the construction that complainant is seeking a decree fixing the *status quo* which prevailed at the time of the rendition of the former decree, to the end that no new appropriations shall be permitted, and that any "new" rights claimed shall be declared to be invalid, and that diversions in excess of those customarily practiced prior to the institution of the former suit should be enjoined.

If it had been the purpose of the pleader to assert that the Bob Creek and Columbine Ditches were new enterprises possessing no rights prior to 1911 (the date of institution of the former suit) or prior to 1909 (the date of the Laramie-Poudre appropriation), and that the Lost Lake System was non-existent at that time, it would have been an easy matter to make this categorical charge.

But instead these diversions are characterized as "illegal", without more. And so with regard to the "excessive" diversions claimed, they are "excessive" only because in excess of the amounts which the pleader considers to have been "allotted" and, therefore, conclusively in violation of the decree.

Thus, virtually the entire case for plaintiff is made upon the theory that the provisos of the modified decree (260 U. S. 1) produce the result that the Water Supply & Storage Company, for example, in its enjoyment of its Skyline Ditch appropriation is as effectually limited to 18,000 acre-feet per annum as is the owner of the Laramie-Poudre tunnel appropriation to 15,500 acre-feet. This result is thought to be attained, although the owner of the Skyline appropriation was not made

a party, nor did the plaintiff in the former suit attack that appropriation but, on the contrary, expressly recognized it, and in argument contended that the amount which reasonably might be anticipated to be diverted would be substantially in excess of the average of 18,000 acre-feet per annum. (See the discussion at page 6, et seq. of "Supplemental Brief on Behalf of Plaintiff" in the former suit.)

This supplemental brief conclusively shows that it was not claimed that the diversions of either the Skyline Ditch or the Divide Ditch could be limited to any precise volume.

At page 10 of that brief, it is said in behalf of Wyoming:

> "Our conclusion with respect to the amount of water that Colorado will divert from the Laramie River into the watershed of the Poudre, is:
>
> 1. That under conditions existing prior to 1913, the amount would in average years exceed 91,000 acre-feet, as contended by Colorado, by at least 4,000 acre-feet, the estimate for both the Skyline and the Divide ditches being 2,000 acre-feet too low, as shown by their records set forth in defendant's Exhibit No. 124."

At page 49 of the brief filed in behalf of Wyoming on the demurrer to the original bill, it is clearly made to appear that the complaint was directed solely against the contemplated tunnel diversion.

Throughout the briefs in the discussion of the subject, there is reference to the "average amount" which might normally be expected to be taken by the Skyline and Divide ditches in Colorado.

No divestiture of right was contemplated as possible by either party.

At page 8 of the Supplemental Brief in Behalf of Wyoming a table is presented showing a diversion by means of the Divide Ditch as high as 6,810 acre-feet in the year 1904.

Contrast this with the "average" which is referred to as

2,000 acre-feet. Similarly in the table it is shown that in the year 1903 the Skyline Ditch discharge included 26,114 acre-feet.

At page 27 of the original brief for Wyoming, there is reference to the evidence of the State Engineer of Colorado, who testified that the anticipated diversion through the tunnel would be 56,000 acre-feet, and that, if an extension of the West Side Collection Ditch were made to McIntyre Creek, as contemplated, an additional amount of 15,000 acre-feet could be procured, making a total possible diversion of 71,000 acre-feet per annum through this system. To this he added 18,000 acre-feet as the *average annual diversion* from the Laramie River into the Poudre through the Skyline Canal, and 2,000 acre-feet as the *average annual diversion* from several of the east side tributaries of the Laramie into the Poudre through an earlier ditch known as the Divide or Wilson Supply Ditch, which carries water around the northern end of the mountains constituting the eastern boundary of the Laramie River drainage area. This makes the total actual and contemplated diversion from the Laramie into the Poudre 91,000 acre-feet. * * * "*These facts constituted the foundation of the plaintiff's case.* * * * that the defendants, having already diverted 20,000 acre-feet per annum from the river for use in another watershed, are now attempting to divert an additional amount of from 56,000 to 71,000 acre-feet * * *."

If this inquiry should be exhaustively pursued, it would be found that throughout there is not a suggestion from either party to the record that the defendant should be limited in respect of any of these "other" appropriations but, instead, their diversions are treated as physical facts affecting the result, as to what might be reasonably anticipated through the years for the future, as to the volume of water normally to be expected as available at the state line to supply the Wyoming rights.

If these "other" rights were before the Court for adjudication and limitation, it is sufficiently obvious that they could

not be limited to an amount which admittedly was the result of averaging all of the diversions through a term of years.

By the table referred to above (page 3398 of the transcript in the former suit), it appears that the diversions of the Skyline ranged from as low as 12,725 acre-feet in the year 1909 to as high as 26,114 acre-feet in the year 1903, and that in the year 1912, 20,986 acre-feet were taken. It is evident that if the corporation owner of this appropriation is now to be limited to a maximum of 18,000 second feet, it will be deprived of a portion of the right upon which the "average" was computed.

It is impossible to place this appropriation in the same category as that of the tunnel. In the decision of this Court in the former action, it is recognized that the tunnel appropriation will receive its full measure of water allocated to it in all years, and that "the Wyoming appropriations will receive the water only after it passes down into that state, and must bear whatever risk is incident to the variation of the natural flow." The result in this connection is very different from that obtained in a general adjudication of water rights, where the control of the stream is vested in a water commissioner.

The Court there reached a practical solution whereby the tunnel appropriator had to sacrifice the normal right to take up to the limit of its projected development after all prior rights should be satisfied, and yet it obtained what the Court regarded as equivalent, namely, in effect a preference right to a defined extent. But in the case of the Skyline Ditch there would be no opportunity to balance rights. The Water Supply & Storage Company, owner of this ditch, is unquestionably senior to all except a very few Wyoming appropriations.

The language of the proviso:

> "That this decree shall not prejudice the right of the State of Colorado, or of anyone recognized by her as duly entitled thereto, to continue to exercise the

> right now existing and hereby recognized to take and divert from such stream 18,000 acre-feet of water per annum, in virtue of and through what is designated * * * as the Skyline Ditch appropriation * * *"

does not and cannot mean that there is prejudice with respect to taking any more than 18,000 acre-feet.

The language "this decree shall not prejudice" is affirmative and final to the extent of the recognition found. Wyoming, in hereafter asserting the rights of citizens and appropriators, should be estopped to claim that this right should be limited below 18,000 acre-feet per annum, but the owner of that appropriation cannot be estopped on the basis of any supposed "average" to claim that its appropriation was vested to the extent, for example, of a total user of 26,000 acre-feet per annum.

Appropriations in both States are measured in terms of flow, and no limitation is imported as to the time when they may be utilized, so long as the water is applied to beneficial use.

If the decree in the former suit was intended, under the proviso, to mean anything other than a full recognition of the Colorado vested rights, which were not attacked in that proceeding, the decree would to that extent be void.

But we confidently assert that there was no such intent.

The position taken by Wyoming was that it dealt with the status of existing Colorado priorities as an accomplished fact —that diversions already made are made under vested right,— and the situation is no different than it would be if the Skyline and Divide ditches were natural streams. In attempting to arrive at a just result as to whether or not the tunnel diversion should be entirely enjoined or limited, it was necessary for the Wyoming appropriators as a class to recognize the existing physical status and the extent of the "average" depletions of the river caused by these Colorado diversions. Nowhere in the testimony adduced, nor in the briefs submitted,

did the plaintiff invite a specific determination of dates and amounts of the Colorado ditch diversions on the one hand as against all appropriators in Wyoming on the other.

The Wyoming theory was that it had appropriated to beneficial use the entire available flow of the river so that there was no residue left for the tunnel. This claim made it necessary to examine the extent of Wyoming rights prior to the tunnel project.

It does not follow that because 272,500 acre-feet were adjudged prior in right to the tunnel, the same quantity of water rights is prior to the Skyline appropriation, for example. Wyoming desired not to complicate its case by seeking a specific adjudication as to parties other than the Laramie-Poudre Company and the Greeley-Poudre district, and so, in order to obviate the necessity of bringing in others as necessary parties, that state saw fit to make certain concessions and the extent of the concessions was as indicated in the language of the proviso to the amended decree.

Wyoming in effect said: "Our 272,500 acre-feet is prior to the tunnel right but we concede that we have no action as to 22,250 acre-feet diverted by others."

The decree cannot be construed to include an adjudication of these "other" rights.

> "The decree should respond to all the pleadings and determine all the issues; but nothing is in issue unless it is raised by the pleadings, and hence the decree must conform not only to the evidence but also to the pleadings; it must be *secundum allegata et probata;* the evidence must conform to the allegations and the decree to both." • • • (21 Corpus Juris "Equity" p. 670, sec. 854)

> "If the pleadings in the case were to give no notice to the parties or to the court of the material facts on which the right asserted was to depend, no notice of the points to which the testimony was to be directed, and to which it was to be limited; if a new case might.

be made out in proof, differing from that stated in the pleadings, all will perceive the confusion and uncertainty which would attend legal proceedings, and the injustice which must frequently take place. The rule that the decree must conform to the allegations, as well as to the proofs of the parties, is not only one which justice requires, but one which necessity imposes on courts."

(Crocket v. Lee, 7 Wheat. 522, 5 Law Ed. 513.)

We consider it to be obvious that the decree as written cannot be construed to be effective as a finality in the sense that all Colorado appropriators are limited to the "allocation" claimed to have been made.

Is it then possible for the plaintiff, on the basis of its present allegations, to go forward with its complaint to the end of obtaining a specific adjudication against every Colorado appropriator, using the decree as a vantage point, but without disclosing any of the facts concerning the relative priority rights claimed to be possessed by Wyoming appropriators as against the Colorado appropriators whose rights are now subject to attack?

It is far from clear that the plaintiff desires to take that position. Rather it appears to be true that it desires to stand upon its interpretation of the decree as written, and that, if the Court should hold that the construction claimed is not tenable, the former record should be examined in its entirety to the end of entering an amended and extended decree.

If, however, it should be thought that there is enough in the bill to suggest the desire of Wyoming to present an issue under which evidence would be taken touching the relative rights of each and every of the stream appropriators in both states, it would appear to be an injustice on the defendant to require it affirmatively to set up the rights in its citizens which it claims are prior to the rights possessed by the owners of the 181,500 acres in Wyoming referred to in the former case.

In this view, Wyoming would be asserting a prima facie

However, as to the latter point, if the Court should be of the opinion that there is sufficient remaining in the bill after the determination of the major issue, and thereupon shall rule the defendant to answer, as to all matters connected with the Laramie-Poudre diversions since the entry of the former decree, the issues of fact in that respect will be promptly tendered.

We insist, however, that the disposition of the cause will be greatly accelerated and confusion be avoided by determining at the threshold the issues of law tendered by the complaint, and thereupon the issues of fact should be defined, if any are considered to stand for adjudication after passing upon the construction problem, which is the only substantial controversy in the case.

Respectfully submitted,

CLARENCE L. IRELAND,

IN EQUITY

No 20, Original

THE STATE OF WYOMING,
Complainant,

vs.

THE STATE OF COLORADO,
Defendant.

Brief in Opposition to Motion to Dismiss

The State of Wyoming filed her bill of complaint on October 6th, 1930, in this Court. The bill seeks to prevent violations of the decree entered October 9th, 1922, reported in Vol. 259, U. S. Rep., Page 419, and Vol. 260, U. S. Rep., Page 1, by the State of Colorado and parties permitted under the laws of Colorado to appropriate and use, in the State of Colorado, the waters of the Laramie River; and the bill alleges the acts and conduct on behalf of defendant constituting such violations.

Colorado moves to have the bill of complaint dismissed, and her grounds therefore are summarized in the statement found in the last paragraph, Page 1, of defendant's brief in support of the motion to dismiss, wherein defendant states:

> "It is our contention that the suit mentioned was concerned solely with the prayer of the State of Wyoming for an injunction prohibiting the diversion of any of the waters of the Laramie River through and by means of the Laramie-Poudre tunnel."

To bring clearly before the Court the only question involved in the case at Bar, complainant states that it is the contention of the Complainant that in the decree entered in the case of Wyoming vs. Colorado, 259 U. S. Rep., Page 419, 260 U. S. Rep., Page 1, the Court determined the available annual water supply for diversion and use to satisfy the demands of the various appropriators and users of water from the Laramie River and tributaries within the States of Colorado and Wyoming, and determined the relative rights of each of said states in the use of the waters of said Laramie River and tributaries.

That Colorado so understands this to be the purpose of this action, is evident from the statement in her brief at the bottom of Page 21, as follows:

> "The principal purpose of the motion to dismiss is to join issue with the contention of the complainant that the whole matter has already been finally adjudicated by the former decree. The problem so presented is a law question and it is apprehended that this should be determined *in limine.*"

THE RELATIVE RIGHTS OF WYOMING AND COLORADO TO THE USE OF THE WATERS OF THE LARAMIE RIVER

This Honorable Court, after rejecting the respective contentions of Wyoming and Colorado in the case of Wyoming vs. Colorado, supra, proceeded to consider the basis on which the relative rights of these STATES in the waters of this interstate stream should be determined. (See opinion, Vol. 259, U. S. Rep., Page 467.)

As a preliminary step to a determination of the question of the relative rights of these states in the use of the waters of this interstate stream, the Court says (See opinion, Page 271, Vol. 259, U. S. Rep.) that the first and one of the most difficult

questions for solution relates to the flow of the Laramie River, the common source of supply, and at Page 488, 259 U. S.:

> "* * * the entire supply available for the proposed Colorado appropriation and the Wyoming appropriations down to and including the diversion for the Wheatland district is 288,000 acre-feet."

and at Pages 489 and 490:

> "There are some existing Colorado appropriations having priorities entitling them to precedence over many of the Wyoming appropriations. These recognized Colorado appropriations are, 18,000 acre-feet for what is known as the Skyline ditch, and 4,250 acre-feet for the irrigation of that number of acres of native-hay meadows in the Laramie valley in Colorado, * * *."

that these recognized diversions are not to be deducted from the 288,000 acre-feet, that being the available supply after they are satisfied.

At Page 489 of said opinion, the Court says:

> "The available supply—the 288,000 acre-feet—is not sufficient to satisfy the Wyoming appropriations dependent thereon and also the proposed Colorado appropriation, so it becomes necessary to consider their relative priorities."

The Court concluded that under the evidence, Wyoming was entitled to appropriate of the determined available annual supply, the amount of 272,500 acre-feet, found by the Court to be a sufficient amount for the irrigation of 181,500 acres of land in Wyoming, leaving available for diversion through and by means of the Laramie-Poudre Tunnel, 15,500 acre-feet annually. (See Opinion Pages 495 and 496.)

CONSTRUCTION OF THE DECREE BY THE STATE OF COLORADO

Upon rendering of the original decree in the former Wyoming-Colorado case, supra, the State of Colorado petitioned for a re-hearing; and Colorado's construction and under-

standing of the scope of said decree, as set forth in said petition for re-hearing, and the effect of the decree upon her rights to the use of the waters of the Laramie River, are set forth in the following words and figures:

"In rendering its decision, the Court failed to apply the doctrine of equitable apportionment as defined in the case of Kansas vs. Colorado. According to the testimony submitted in this case, Colorado produces more than one-half of the water of the Laramie River. Under the decision herein, Colorado is limited to 37,750 acre-feet annually (Skyline, 18,000, plus Colorado Meadows 4,250, plus Laramie-Poudre Tunnel, 15,500). The Court determines the water supply available to the Wyoming lands as follows:

"Laramie river at Wood's	170,000 a.-ft.
Little Laramie river	93,000 "
Lower tributaries	25,000 "
Total	288,000 "
Adding the Colorado Trans-mountain diversion and consumption	22,250 "
The total water supply will be	310,250 "

"The 37,750 acre-feet annual Colorado allotment is about 13 per cent of the Basin water supply, and the Wyoming allotment is about 87 per cent of the total water supply."

"Under the court's analysis, Colorado will receive for utilization approximately one-eighth of the Laramie Basin water supply and Wyoming seven-eighths, notwithstanding Colorado produces one-half of the water supply * * *.

"The fact that both States within their borders recognize the doctrine of prior appropriation does not take away the sovereignty of either State. Under the circumstances set forth in this case Colorado has not, in our opinion, received an equitable proportion of the waters of the Laramie river, and, unless under the facts herein, the court desires to adopt a rule different from that in the Kansas-Colorado case, a greater proportion than one-

eighth of the water of the Laramie river should be allotted to Colorado."

DEPARTMENTAL CONSTRUCTION OF THE DECREE BY COLORADO OFFICIALS

On March 14th, 1923, the Chief Clerk in the office of the State Engineer of Colorado, Mr. C. C. Hezmalhalch, in response to an inquiry received in that office from one, Agnes Zimmerman, stated as follows:

> "Replying to your letter of the 7th inst. in which you ask as to whether or not Laramie and Lost Lakes have been covered by filings.
>
> "I have searched through the records and have been unable to find filing covering these specific locations. From available data we have here these lakes are in the Larimie River water shed and at this date would not be subject to appropriation on account of the Wyoming-Colorado water suit."

In the case of The La Plata River and Cherry Creek Ditch Company v. M. C. Hinderlider, as State Engineer of the State of Colorado, et al., pending in the Supreme Court of the State of Colorado, the Attorney General of Colorado, at Page 62 of his brief, filed in said cause, construes the Wyoming v. Colorado decree, 259 U. S. 419, 260 U. S., Page 1, as follows:

"WYOMING v. COLORADO

> "We come then to the much discussed opinion in the case of Wyoming v. Colorado, 259 U. S. 419, which, plaintiff asserts, removes the water rights here in question from the jurisdiction of the states and their compact, because the relative dates of appropriation determine the rights of individual water users on an interstate stream regardless of state lines.
>
> "While there may be some basis for such a contention we submit that a closer study of the opinion and the amended decree (260 U. S. 1) demonstrates that this is not its real import.

"The Court, in a measure recognized the underlying principle of the doctrine of prior appropriations in making an apportionment of the waters of the river between Colorado and Wyoming to the extent of allocating sufficient water to protect their established development. But the court did not establish the relative status of individual appropriations in the two states.

"The opinion and the amended decree, when read together, reveal that a definite apportionment is made to each state and the local distribution among the numerous appropriators is left to state officials acting under state laws.

"In determining the quantum allocated to each state the court departed from the doctrine of prior appropriation. It allocated to each state a portion of the 'average dependable flow' of the river which it determined by eliminating years of heavy flow.

"It placed upon Wyoming the entire burden of providing storage to equalize the annual flow without respect to relative priorities. It confirmed in Colorado the right to perpetually divert not more than 15,500 acre-feet annually through its tunnel enterprise regardless of the effect of such diversion upon senior appropriators in Wyoming and notwithstanding the fact that the court had already found the tunnel enterprise to be the most junior appropriator in either state."

CONSTRUCTION OF THE DECREE BY WYOMING

Wyoming, in Paragraph Five of her bill of complaint in this case, sets forth her understanding and scope of said decree in the former Wyoming-Colorado case, supra, as follows:

"That this Honorable Court further found the entire water supply available for the proposed Colorado appropriation and the Wyoming appropriations down to and including the diversion for the Wheatland district is 288,000 acre-feet per annum; and that there are some existing Colorado appropriations having priorities entitling them to precedence over many of the Wyoming appropriations; that these recognized Colorado appropriations are 18,000

acre-feet to be diverted by what is known as the Skyline ditch diversion, and 4,250 acre-feet for the irrigation of that number of acres of native-hay meadows in the Laramie valley in Colorado; and that these recognized Colorado appropriations, aggregating 22,250 acre-feet, were not to be deducted from the 288,000 acre-feet, that being the available annual supply after they are satisfied; and that thus the total available annual supply of water for irrigation, in Wyoming and Colorado out of the waters of the Laramie river and its tributaries, was said 288,000 acre-feet of water, and said 22,250 acre-feet of water; or a total available annual supply of water for irrigation of lands in Colorado and Wyoming from the Laramie river and its tributaries in the total sum of 310,250 acre-feet of water; in addition to the waters of Sand Creek, which rises in Colorado and extends into the Laramie plains in Wyoming, and discharges into Hutton Lake, a few miles from the Laramie River, and the waters of which creek, for reasons stated in the opinion, were not regarded by this Honorable Court as a factor in the controversy;"

SUBJECT MATTER OF THIS SUIT

The subject matter of this suit is the enforcement of the decree as rendered in the former Wyoming-Colorado case, supra, which determined the relative rights of the States of Wyoming and Colorado in the use of the waters of the Laramie River, an interstate stream, and its tributaries. Defendant State of Colorado contends that this Honorable Court has no jurisdiction to enforce this decree and says the bill of complaint should be dismissed because of this alleged want of jurisdiction.

The privilege of the complainant State of Wyoming to come into this Court and obtain protection of her relative rights to divert and appropriate to beneficial use in the State of Wyoming, its equitable apportionment of the waters of the Laramie River, an interstate stream, as determined by said former decree of this Honorable Court in the case of Wyoming vs. Colorado, supra, is sustained by the following cases:

Missouri vs. Illinois, 180 U. S. 496;
Georgia vs. Tennessee Copper Co., 206 U. S. 230; 237 U. S. 474;
Kansas vs. Colorado, 185 U. S. 125; 206 U. S. 46;
New Jersey vs. State of New York, 283 U. S. 336;
Connecticut vs. Commonwealth of Massachusetts, 282 U. S. 660;
Hudson Water Co. vs. McCarter, 209 U. S. 353.

The jurisdiction of this Court is challenged by defendant on the ground that the matters set forth in the bill of complaint do not constitute a controversy between the State of Wyoming and the State of Colorado.

In support of this contention, defendant argues that the decree rendered in the former Wyoming-Colorado case cannot be construed to limit diversions other than the Laramie-Poudre Tunnel; that the said decree does not operate to determine as a whole the relative right of the defendant State of Colorado, and all parties claiming rights under the laws of the State of Colorado, to divert and apply to beneficial use the waters of the Laramie River in the State of Colorado. In other words, Colorado now contends that the former suit was not one between the contending states for the purpose of determining the relative rights of each state to the use of the waters of the Laramie River, an interstate stream.

In so contending, defendant challenges the construction of said decree by this Honorable Court.

See State of Connecticut vs. Commonwealth of Massachusetts, supra;
State of New Jersey vs. State of New York, et al., supra.

Colorado now repudiates her former position as to the object of the Wyoming-Colorado suit, supra, where Colorado stated it was not a suit between private parties but rather one between the sovereign states of Wyoming and Colorado, which contention is set forth in the following quotation from Colorado's brief, Vol. 1, Page 128 to 145, filed in this Court October, 1916, Term, Original No. 7:

"THE LAW OF THE CASE

"We have now discussed the facts of this case and to them, as summed up, we will endeavor to apply the law of the case.

"When Colorado became a state in 1876, she became sovereign within the limits of her territory except as to the limited and enumerated powers given to the national government. She became the owner, in her sovereign capacity, independent of and behind her people as to all her great natural resources such as air, light and water, with equal rights as the original thirteen states.

> " 'One cardinal rule, underlying all the relations of the States to each other, is that of equality of right. Each State stands on the same level with all the rest. It can impose its own legislation on no one of the others, and is bound to yield its own views to none.'
>
> Kansas vs. Colorado, 206 U. S. 97.

"The State of Colorado and the State of Wyoming respectively have the same equal rights as any one of the thirteen original states, and as to the waters of their interstate streams, their respective rights are the same as to the waters thereof within their limits as though they were one of the original thirteen states, except as to the factors of the waters being of an interstate stream and in an arid country. The controversy is not one between private parties, as in Bean vs. Morris, 221 U. S. 485; Rickey vs. Miller & Lux, 218 U. S. 258, which cases will be hereinafter discussed, but is a case between two sovereign commonwealths insisting respectively upon the waters here in controversy, Colorado insisting upon making the diversion in her right as a sovereign commonwealth and Wyoming insisting in the same capacity on the right being denied.

"Manville Co. vs. Worcester, 138 Mass. 89, decided in 1884, opinion by Mr. Justice Holmes, then of the Supreme Court of Massachusetts and now and for many years last past a Justice of the Supreme Court of the United States, was an action of tort for diverting the waters of a natural

stream in the Commonwealth of Massachusetts and preventing the same from coming to plaintiff's mill in the adjoining state of Rhode Island. The action was treated as an action between private parties. It was held that it would lie upon the ground that the servitude was being exercised with the presumed consent of the Commonwealth of Massachusetts. It is clear, however, throughout the opinion that if the Commonwealth of Massachusetts were objecting, the objection would be effective and that it was competent for Massachusetts to control the great natural resources within her limits. *Inter alia the* court said:

> " 'A concurrence of the laws of both States is as necessary in that case as in the one at bar, to create a liability which can be enforced in either State consistently with principle. * * *
>
> " 'Of course, the laws of Rhode Island cannot subject Massachusetts land to a servitude, and, apart from any constitutional considerations, if there are any, which we do not mean to intimate, Massachusetts might prohibit the creation of such servitudes. So it might authorize any acts to be done within its limits, however injurious to lands or persons outside them. But it does not do either.
>
> " 'It has no more objection to a citizen of Rhode Island owning an easement, as incident to his ownership of land in that State, than it has to his owning it in gross, or to his purchasing lands here in fee. * * * So far as their creation is concerned, the law of Massachusetts governs, whether the mode of creation be by deed or prescription, or whether the right be one which is regarded as naturally arising out of the relation between the two estates; being created, the law of Rhode Island, by permission of that of Massachusetts, lays hold of them and attaches them in such way as it sees fit to land there, Massachusetts being secured against anything contrary to its views of policy by the common traditions of the two States, and by the power over its own territory which *it holds in reserve.*'

"The language contained in this opinion becomes more significant as we read the opinions of the Supreme Court of the United States as to the questions there involved, wherein that court speaks through the same jurist, Mr. Justice Holmes.

"Hudson Water Co. vs. McCarter, 209 U. S. 353, opinion by Mr. Justice Holmes, decided in 1907. Here the question was between a private party and the State of New Jersey, the state being represented by its Attorney General, McCarter. The defendant, the Hudson Water Company, under a contract with the City of Bayonne, in New Jersey, had laid mains for the purpose of carrying water to Staten Island in the State of New York. By other contracts it was to get the water from the Passaic River at Little Falls, where the East Jersey Water Company has a large plant by which the water is withdrawn. The State of New Jersey, reciting the need of preserving the fresh water of the state for the health and prosperity of the citizens, enacted that it should be unlawful to transport the waters of any river of the state into any other state for use therein. Action was brought by the State of New Jersey to enjoin carrying the waters of the Passaic River out of the state. The action was sustained. *Inter alia* the court said:

> " 'But we prefer to put the authority which cannot be denied to the state upon a broader ground than that which was emphasized below, since in our opinion it is independent of the more or less attenuated residuum of title that the State may be said to possess. * * *
>
> " 'It sometimes is difficult to fix boundary stones between the private right of property and the police power when, as in the case at bar, we know of few decisions that are very much in point. But it is recognized that the State as quasi-sovereign and representative of the interests of the public has a standing in court to protect the atmosphere, the water and the forests within its territory, *irrespective of the assent or dissent of the private owners of the land most immediately concerned.* Kansas v. Colorado, 185 U. S. 125, 141, 142; Id. 206 U. S. 46, 99; Georgia

v. Tennessee Copper Co., 206 U. S. 230, 238. What it may protect by suit in this court from interference in the name of property outside of the State's jurisdiction, one would think that it could protect by statute from interference in the same name within. On this principle of public interest and the police power, and not merely as the inheritor of a royal prerogative, the State may make laws for the preservation of game, which seems a stronger case. Geer vs. Connecticut, 161 U. S. 519, 534.'

" 'It appears to us that few public interests are more obvious, indisputable and independent of particular theory than the interest of the public of a State to maintain the rivers that are wholly within it substantially undiminished, except by such drafts upon them as the guardian of the public welfare may permit for the purpose of turning them to a more perfect use.'

" 'But we agree with the New Jersey courts, and think it quite beyond any rational view of riparian rights that an agreement, *of no matter what private owners*, could sanction the diversion of an important stream outside the boundaries of the State in which it flows. *The private right to appropriate* is subject not only to the rights of lower owners but to the initial limitation that it *may not substantially diminish one of the great foundations of public welfare and health.*

" 'We are of opinion, further, that the constitutional power of the State to insist that its natural advantages shall remain unimpaired by its citizens is not dependent upon any nice estimate of the extent of present use or speculation as to future needs. The legal conception of the necessary is apt to be confined to somewhat rudimentary wants, and there are benefits from a great river that might escape a lawyer's view. But the State is not required to submit even to an aesthetic analysis. Any analysis may be inadequate. It finds itself in possession of what all admit to be a great public good, and what it has it may keep and give no one a reason for its will. * * *

" 'It constantly is necessary to reconcile and to adjust different constitutional principles, each of which would be entitled to possession of the disputed ground but for the presence of the others, as we already have said that it is necessary to reconcile and to adjust different principles of the common law. * * * The right to receive water from a river through pipes is subject to territorial limits by nature, and those limits may be fixed by the State within which the river flows, even if they are made to coincide with the state line.'

"The court, in the course of the opinion, says:

" 'Problems of irrigation have no place here.'

"The opinion shows, however, the rights of a sovereign state in the streams of the state, when such right is unaffected by and is not required to be reconciled with the problem of irrigation.

"Walbridge vs. Robinson, 22 Idaho 240, decided in 1912, was an appeal from an order granting a writ of mandate, resulting in a reversal of the lower court. Respondent made an application to the state engineer for a permit to appropriate water from Bear Creek, a branch of Clear Water River, situate in Idaho County. This application was for the diversion of waters to be carried and applied to irrigation in the state of Montana. The permit was issued. Prior to its issuance, a similar permit had been granted for the diversion of waters from Bear Creek to be carried and used in the State of Montana. Subsequent to the issuance of these permits, a contest was filed by the respondents and after a hearing, the state engineer refused to take any action on the matter or grant any relief to either of the parties upon the ground that in issuing the permits he had exceeded his lawful authority in attempting to grant a right for the diversion of waters of that state to be applied to a beneficial use in another state. Thereafter respondents asked that they be given certificate of the completion of their works. The engineer refused to take action on the ground that he had no authority to grant such certificates. A suit was thereupon instituted. Bear Creek was not an interstate stream, but

located wholly within the State of Idaho. There was a declaration of the constitution as to the ownership of waters similar in legal effect to our own. Commenting thereon the court said:

> " 'It is further contended that this latter declaration of the statute is only a written expression of what the law has always been with reference to the public waters of a state.
>
> " 'Freund, in his work on the Police Power of the state, at Sec. 417, seems to entertain this view, and in discussing similar statutes in other states, says: "Such declaration is expressive of what is believed to be the law, and does not intend to make new law."
>
> " 'We think it is clear that the title to the public waters of the state is vested in the state for the use and benefit of all the citizens of the state under such rules and regulations as may be prescribed from time to time by the law-making power of the state. This is not, however, an interest or title in the proprietary sense, but rather in the sovereign capacity as representative of all the people for the purpose of guaranteeing that the common rights of all shall be equally protected and that no one shall be denied his proper use and benefit of this common necessity. * * *
>
> " 'There is no doubt in our minds but that the state in its sovereign capacity is the owner of the waters flowing in the streams thereof and may exercise its authority over the same. If the foregoing propositions be correct, the state has the right to prohibit the diversion of the waters of its stream for use outside of and beyond the boundaries of the state. In other words, as said by the supreme court in Geer v. Connecticut, supra, "The common ownership imports the right to keep the property, if the sovereign so chooses, always within its jurisdiction for every purpose." '

"The sovereign right of each one of the states of this Union of states to own and protect its great natural resources and its privilege to come into this court and ask legal protection of the right to such great natural resources appears through these cases.

"In Missouri vs. Illinois, 180 U. S. 208, and 200 U. S. 496, the latter decided in 1905, opinion by Mr. Justice Holmes; Kansas vs. Colorado, 185 U. S. 125, and 206 U. S. 46, decided in 1906; Georgia vs. Tennessee Copper Co., 206 U. S. 230, 237 U. S. 474, opinion by Mr. Justice Holmes.

"It is clear that there is a sovereign right in the state independent of and behind the title of its citizens in its great natural resources, and that this court has jurisdiction of the legal contest to protect and enforce such rights. Further, that the extent to which a sovereign state may insist on this right largely rests with her. In Hudson Water Co. vs. McCarter, supra, it is said:

> " 'It finds itself in possession of what all admit to be a great public good, and what it has it may keep and give no one a reason for its will.'

"In Missouri vs. Illinois, the court recognized the right of Missouri to come by original suit into this court and protect its citizens against any contamination that might arise through sewage of the city of Chicago being turned into a tributary of the Missouri River.

"In Georgia vs. Tennessee Copper Company, a bill in equity was filed in pursuance of a resolution of the legislature and by direction of the Governor of Georgia, to enjoin defendant copper company from discharging noxious gas from their works in Tennessee over the plaintiff's territory. *Inter alia*, the court said:

> " 'The case has been argued largely as if it were one between *two private parties;* but it is not. The very elements that would be relied upon in a suit between fellow-citizens as a ground for equitable relief are wanting here. The State owns very little of the territory alleged to be affected, and the damage to it capable of estimate in money, possibly, at least, is small. This is a suit by a State for an injury to it in its capacity of quasi-sovereign. In that capacity the State has an interest independent of and behind the titles of its citizens, in all the earth and air within its domain. It has the last word as to whether its mountains shall be stripped of their forests and its

inhabitants shall breathe pure air. It might have to pay individuals before it could utter that word, but with it remains the final power. The alleged damage to the State as a private owner is merely a make-weight, and we may lay on one side the dispute as to whether the destruction of forests has led to the gullying of its roads. * * *

"'They (states) did not renounce the possibility of making reasonable demands on the ground of their still remaining quasi-sovereign interests; and the alternative to force is a suit in this court. * * *

"'The States by entering the Union did not sink to the position of *private owners subject to one system of private law.* * * * Without excluding the consideration that equity always takes into account, we cannot give the weight that was given them in argument to a comparison between the damage threatened to the plaintiff and the calamity of a possible stop to the defendants' business, the question of health, the character of the forests as a first or second growth, the commercial possibility or impossibility of reducing the fumes to sulphuric acid, the special adaptation of the business to the place.

"'It is a fair and reasonable demand on the part of a sovereign that the air over its territory should not be polluted on a great scale by sulphurous acid gas, that the forests on its mountains, be they better or worse, * * * should not be further destroyed or threatened by the act of persons beyond its control, that the crops and orchards on its hills should not be endangered from the same source. If any such demand is to be enforced this must be, notwithstanding the hesitation that we might feel if the suit were *between private parties*, and the doubt whether for the injuries which they might be suffering to their property they should not be left to an action at law. * * *

"'Whether Georgia by insisting upon this claim is doing more harm than good to her own citizens is for her to determine. The possible disaster to those outside the State must be accepted as a consequence of her standing upon her extreme rights.'

"The cause of the suit was an insistence upon the right of Georgia to be protected in the reasonable enjoyment of her rights of sovereignty. The plaintiff prevailed. The case did not proceed upon the theory of the litigation being between private parties, but upon the fact of peculiar rights inhering in litigants with sovereign powers.

"Rickey Land & Cattle Co. vs. Miller & Lux, 218 U. S. 258, decided in 1910, opinion by Mr. Justice Holmes, was an action between private parties in reference to the waters of an interstate stream and the character of that action is carefully distinguished from a case wherein the sovereignty itself is insisting upon its right to the waters of a stream. Miller & Lux, the corporation using the water of Walker River in Nevada, claimed rights therein. Two branches of the river rise in California and unite in Nevada above Miller & Lux. Rickey used water of both branches in California and claimed rights superior to parties lower down. In 1902 Miller & Lux brought suit in the circuit court for the district of Nevada against Rickey and certain other defendants to enjoin interference with its use of water. Rickey pleaded that the diversion by him was in California and later answered. After appearing, he organized the petitioning corporation and conveyed his rights in California to it. In 1904 this corporation began two actions in the state court of California against Miller & Lux, and others, to quiet its title to certain water rights on the west fork and east fork, supra. In December, after they were served with process in the last mentioned suit, other defendants in the bill brought by Miller & Lux brought a cross bill against Rickey to establish their priorities. In 1906 the bills in these present cases were brought by Miller & Lux to restrain proceedings in the California actions on the ground that the Federal Court had acquired jurisdiction before the California actions were begun. Injunctions were granted. *Inter alia* the court said:

> " 'The petitioner contends that there is no conflict of jurisdiction, and that the proceedings in the California court should go on. Its argument is this: When a right is asserted in favor of land in one jurisdiction over land in another, different principles are

involved from those that suffice when both parcels are subject to the same law. When such rights have been recognized, it has been on the ground of an assumed "concurrence between the two states, the one, so to speak, offering the right, the other permitting it to be accepted. Manville Co. vs. Worcester, 138 Mass. 89." Missouri vs. Illinois, 200 U. S. 496, 521. But still there are two parcels of land subject to different systems of law; and although the rights and liabilities in respect of each may require a consideration of the other if they are to be dealt with completely, the fact remains that each may be regulated by the state where the land lies according to its sovereign will. Kansas vs. Colorado, 206 U. S. 46, 93. If, then, the courts of one state are about to deal with one parcel they should not be indirectly interfered with by a foreign court that has no power to control the use of the *res*. It is said to be a general principle that apart from some privity, such as is created by contract, trust, or fraud, courts of equity recognize the impropriety of using their power over the person to achieve such a result. (Citing cases.) It is conceivable, to be sure, that the decisions of this court may determine that the States have rights as against each other *in invitum* in streams that flow through the land of both. Kansas vs. Colorado, 206 U. S. 46, 84; Missouri vs. Illinois, 200 U. S. 496, 519-20. These rights may vary according to the system of law required by natural conditions. They may be more or less analogous to common law rights between upper and lower proprietors, where irrigation is not necessary, as in most of the older states. See New York vs. Pine, 185 U. S. 93, 96. There may be some, perhaps limited, right of appropriation in the upper state, at least in the water shed of the stream, where irrigation is the condition of using the land. See Kansas vs. Colorado, 206 U. S. 46, 100-104, 117. *But whatever this court may decide, if a private owner should derive advantage from such a decision it would not be in his own right, but by reason of and subordinate to the rights of his state,* and those rights, the peti-

tioner insists, can, or a least should be, determined only in a suit brought by the state itself. * * * To affect a purchaser with a suit against his vendor, it is said that at least the *res* must be within the territorial jurisdiction of the court in which the suit is brought. See Fall vs. Eastin, 215 U. S. 1.

"'We are of the opinion that the petitioner fails to establish the conclusion for which it contends. The alleged rights of Miller and Lux involve a relation between parcels of land that cannot be brought within the same jurisdiction. This relation depends as well upon the permission of the laws of Nevada as upon the compulsion of the laws of California. It is true that the acts necessary to enforce it must be done in California, and require the assent of that state so far as this court does not decide that they may be demanded as a consequence of whatever right, if any, it may attribute to Nevada. But, leaving the latter possibility on one side, if California recognizes private rights that cross the border line, the analogies are in favor of allowing them to be enforced within the jurisdiction of either party to the joint arrangement.'

"The decree below was approved. The court, however, makes it clear that the suit was between private parties and that the right of land owned by a private party in Nevada to claim a servitude upon the California lands was based upon the assumed consent of California. Particularly worthy of note is the contention of petitioner, the reasons assigned in which the court does not apparently differ from but only differs in the conclusion. In this argument it is recognized that the rights of individuals in waters of an interstate stream are subordinate and inferior to the rights that the sovereign may claim when it asserts its own.

"Bean vs. Morris, 221 U. S. 485, decided in 1910, opinion by Mr. Justice Holmes, is again a suit between private parties over the waters of an interstate stream, and the learned justice keeps in bold relief that there is a distinction between such a contention when the litigants are

sovereign states. The suit was by respondent Morris to prevent petitioners from so diverting the water of Sage Creek in Montana as to interfere with an alleged prior right of Morris by appropriation in Wyoming. Afterwards Howell was allowed to intervene and make similar claim. Sage Creek, non-navigable, joins Stinking Water in Wyoming, the latter flows into Big Horn and then back into Montana and unites with the Yellowstone. Decree went for Morris and for Howell subject to the claim of Morris, both parties being prior in time and right to the petitioners. It was admitted in argument that but for the fact that the prior appropriation was in Wyoming and the interference in Montana, the decree would be right. The court, *inter alia*, said:

> " 'So we pass at once to the question of private water rights as between users in different states.
>
> " 'We know no reason to doubt, and we assume, that, subject *to such rights as the lower state might be decided by this court to have*, and to vested private rights, if any, protected by the Constitution, the State of Montana has full legislative power over Sage Creek while it flows within that state. Kansas vs. Colo., 206 U. S. 46, 93-95. Therefore, *subject to the same qualifications*, we assume that the concurrence of the laws of Montana with those of Wyoming is necessary to create easements, or such private rights and obligations as are in dispute, across their common boundary line. Missouri vs. Illinois, 200 U. S. 496, 521; Rickey Land and Cattle Company vs. Miller and Lux, 218 U. S. 258, 260. But with regard to such rights as came into question in the older States, *we believe that it always was assumed, in the absence of legislation to the contrary*, that the States were willing to ignore boundaries, and allowed the same rights to be acquired from outside the state that could be acquired from within.' (Mannville Co. vs. Worcester, 138 Mass. 89, and other cases cited.) 'There is even stronger reason for the same assumption here. Montana cannot be presumed to be intent on suicide, and there are as many if not more cases in which it would lose as there are in which it would gain, if it invoked

a trial of strength with its neighbors. * * * The doctrine of appropriation has prevailed in these regions probably from the first moment that they knew any law, and has continued since they became territory of the United States.

"'It was recognized by the statutes of the United States, while Montana and Wyoming were such territory * * * and is recognized by both States now. Before the state lines were drawn, of course, the principle prevailed between the lands that were destined to be thus artificially divided. Indeed, Morris had made his appropriation before either state was admitted to the Union. The only reasonable presumption is that the States, upon their incorporation, continued the system that had prevailed theretofore, *and made no changes other than those necessarily implied or expressed.* * * * It follows from what we have said that it is unnecessary to consider what limits there may be to the powers of an upper State, if it should seek to do all that it could. The grounds upon which such limits would stand are referred to in Rickey Land and Cattle Company vs. Miller and Lux, 218 U. S. 258, 261.'

"The decree below is affirmed, the court finding that the Wyoming lands held a servitude upon the Montana lands upon the theory that as between private parties, the State of Montana was presumed to have consented, but is strongly suggestive that the right to appropriate at the expense of Montana was subject to the will of Montana as a state and such limits as might be put upon her sovereignty by the doctrine of interstate waters.

"The great case in which the rights of sovereign states in the waters of an interstate stream, where the problems of irrigation had place, are presented, discussed and decided in Kansas vs. Colorado, 206 U. S. 46, decided in 1906, opinion by Mr. Justice Brewer. Of this case a great lawyer and an eloquent senator from this commonwealth recently said in the Senate of the United States:

"'The decision in the case of Kansas vs. Colorado is one of the great opinions of the Supreme Court of the United States. To my mind it easily ranks with the most notable judicial pronouncements of that great tribunal and, as time passes, I believe that fact will be more and more recognized; perhaps I should say particularly with reference to its definition of the powers of the government and the distinction it so clearly draws between those powers and the reserved powers of the states.'

"Kansas brought suit against the State of Colorado and a number of private ditch companies for the purpose of enjoining them from diverting waters from the Arkansas River. The State of Colorado appeared insisting upon her rights in the stream as one of her sovereign rights. The ditch companies answered, setting up their priorities. Proof was adduced as to the priorities of certain ditches in Kansas earlier in point of time than Colorado ditches and which Kansas ditches, the evidence showed, were deprived of water by the Colorado diversions. The Government of the United States intervened. Its bill of intervention was dismissed upon the ground that it did not own the waters of the Arkansas River, that it had no rights therein as the question of navigation did not arise, and it was dismissed from the suit. It is difficult to understand, after the ruling in this great and luminous case, that the Government of the United States still insists, through some of its departments, on being interested in non-navigable streams. It may be said, however, that when waters are sought to be appropriated from the streams of any state for any national government project, the National Government deems it to be the safe course to comply with the state laws as any other consumer would in his efforts to acquire rights by prior appropriation in the waters of a stream.

"The careful reasoning of the court in approaching its ruling in this case, that it was keeping constantly before its mind in deciding the grave question it was ruling between two sovereign commonwealths, the principle laid

down by the court in the sewage case, Missouri vs. Illinois, 200 U. S. 521, wherein it is said:

> " 'Before this court ought to intervene the case should be of serious magnitude, clearly and fully proved, and the principle to be applied should be one which the court is prepared deliberately to maintain against all considerations on the other side.'

"In perhaps no case in the history of this great court has there been shown greater and more thoughtful care in guarding the rights of the states than in this case of Kansas vs. Colorado. An unjust decision might have destroyed the agricultural resources of a state which, resting upon the crest of the continent where the waters begin which flow to the east, to the west, to the north and the south, and where a declaration of the applicability of the riparian rights would have visited with destruction not only the development of the Arkansas valley, but the other great valleys of Colorado, the court, conforming to the principles of common law, international law and state law, rendered a decision which fully protected the rights of the litigants and declared no precedent that would be destructive to the rights of the states in future litigation.

"The pith of this ruling, when fully considered, is that the court of law adjusted itself to conditions as it found them, aiming to administer the highest justice between man and man; that applying its principles and all other principles of jurisprudence in the relations between the states, it was the controlling purpose of the court to work out justice; that as to this interstate stream in the reasonable exercise of their respective sovereign rights, each of the states was entitled to a reasonable part of the waters; that the court would not consider the question of private rights among the ditch companies; that the disposition of the rights of the two states would be a disposition of the rights of the private parties, for the reason that the rights of the private parties were subordinate to the rights of the states; that if the court found, as it did find, that Colorado was not diverting from this stream any more than a reasonable part of the waters of the stream and for that reason the bill must be dismissed, that the

rights of the private ditch companies and their priorities were immaterial.

"In conclusion, the court held that Colorado was not taking more than a reasonable part of the waters of this interstate stream; that she was entitled to take a reasonable part in the exercise of her rights of sovereignty; that even though this exercise of a right of sovereignty worked some prejudice to Kansas, no legal wrong was done; that if, at any time it might appear that Colorado was taking more than a reasonable part of the waters of this stream, Kansas could justly come again. The bill was dismissed.

"Excerpts from this decision pertaining to the question before us are:

> "'But it is useless to pursue the inquiry further in this direction. It is enough for the purposes of this case that each State has full jurisdiction over the lands within its borders, including the beds of streams and other waters.' 93.
>
> "'But when the States of Kansas and Colorado were admitted into the Union they were admitted with the full powers of local sovereignty which belonged to other States. * * * and Colorado by its legislation has recognized the right of appropriating the flowing waters to the purposes of irrigation.' 95.
>
> "'"Can it be that the great multitude of interstate commercial transactions are freed from the burdens created by the common law as so defined, and are subject to no rule except that it be found in the statutes of Congress? We are clearly of opinion that this cannot be so, and that the principles of the common law are operative upon all interstate commercial transactions except so far as they are modified by Congressional enactment."' 96.
>
> "'For after all, the common law is but the accumulated expressions of the various judicial tribunals in their efforts to ascertain what is right and just between individuals in respect to private disputes.' 97.
>
> "'Nor is our jurisdiction ousted, even if, because Kansas and Colorado are States sovereign and in-

dependent in local matters, the relations between them depend in any respect upon principles of international law. International law is no alien in this tribunal.' 97.

" ' "Sitting, as it were, as an international, as well as a domestic tribunal, we apply Federal law, state law, and international law, as the exigencies of the particular case may demand."

" 'One cardinal rule, underlying all the relations of the States to each other, is that of equality of right. Each State stands on the same level with all the rest.' 97.

" 'Yet, whenever, as in the case of Missouri v. Illinois, 180 U. S. 208, the action of one State reaches through the agency of natural laws into the territory of another State, the question of the extent and the limitations of the rights of the two States becomes a matter of justiciable dispute between them, and this court is called upon to settle that dispute in such a way as will recognize the equal rights of both and at the same time establish justice between them. In other words, through these successive disputes and decisions this court is practically building up what may not improperly be called interstate common law.' 97, 98.

" 'It will be perceived that Kansas asserts a pecuniary interest as the owner of certain tracts along the banks of the Arkansas and as the owner of the bed of the stream. We need not stop to consider what rights such private ownership of property might give.' 98.

" 'The action complained of is state action.'

" 'The controversy arises, therefore, above a mere question of local private right and involves a matter of state interest, and must be considered from that standpoint.' 99.

" 'May we not consider some appropriation by Colorado of the waters of the Arkansas to the irrigation and reclamation of its arid lands as a reasonable exercise of its sovereignty and as not unreasonably trespassing upon any rights of Kansas?' 102.

"'What is such a just and reasonable use, may often be a difficult question, depending on various circumstances. To take a quantity of water from a large running stream for agricultural or manufacturing purposes, would cause no sensible or practicable diminution of the benefit, to the prejudice of a lower proprietor; whereas, taking the same quantity from a small running brook passing through many farms, would be of great and manifest injury to those below, who need it for domestic supply or watering cattle; and therefore it would be an unreasonable use of the water, and an action would lie in the latter case and not in the former. It is, therefore, to a considerable extent a question of degree; still, the rule is the same, that each proprietor has a right to a reasonable use of it, for his own benefit, for domestic use, and for manufacturing and agricultural purposes.' 103-4.

"'At one time there were some irrigating ditches in these western (Kansas) counties, which promised to be valuable in supplying water and thus increasing the productiveness of the lands in the vicinity of the stream, and it is true that those ditches have ceased to be of much value, the flow in them having largely diminished.

"'It cannot be denied in view of all the testimony * * * that the diminution of the flow of water in the river by the irrigation of Colorado has worked some detriment to the southwestern part of Kansas, and yet when we compare the amount of this detriment with the great benefit which has obviously resulted to the counties in Colorado, it would seem that equality of right and equity between the two States forbids any interference with the present withdrawal of water in Colorado for purposes of irrigation.' 113-114.

"'Summing up our conclusions, we are of the opinion * * * that the appropriation of the waters of the Arkansas by Colorado, for purposes of irrigation, has diminished the flow of water into the State of Kansas; that the result of that appropriation has been the reclamation of large areas in Colorado,

transforming thousands of acres into fertile fields and rendering possible their occupation and cultivation when otherwise they would have continued barren and unoccupied; that while the influence of such diminution has been of perceptible injury to portions of the Arkansas Valley in Kansas, particularly those portions closest to the Colorado line, yet to the great body of the valley it has worked little, if any, detriment, and regarding the interests of both States and the right of each to receive benefit through irrigation and in any other manner from the waters of this stream, we are not satisfied that Kansas has made out a case entitling it to a decree. At the same time it is obvious that if the depletion of the waters of the river by Colorado continues to increase there will come a time when Kansas may justly say that there is no longer an equitable division of benefits and may rightfully call for relief against the action of Colorado, its corporations and citizens in appropriating the waters of the Arkansas for irrigation purposes.

" 'The decree, which, therefore, will be entered will be one dismissing the petition of the intervener, without prejudice to the rights of the United States to take such action as it shall deem necessary to preserve or improve the navigability of the Arkansas River. The decree will also dismiss the bill of the State of Kansas as against all the defendants, without prejudice to the right of the plaintiff to institute new proceedings whenever it shall appear that through a material increase in the depletion of the waters of the Arkansas by Colorado, its corporations or citizens, the substantial interests of Kansas are being injured to the extent of destroying the equitable apportionment of benefits between the two States resulting from the flow of the river.' 117-118.

"The ruling was that each state was entitled to an equitable apportionment of benefits between the two states resulting from the flow of the river, which equitable apportionment of benefits could only be secured

through an equitable apportionment of the waters of this interstate stream.

"The doctrine of prior appropriation has at all times obtained in Colorado and Wyoming.

> " 'The doctrine of appropriation has prevailed in this region probably from the first moment that they knew of any law, and has continued since they became territory of the United States.'

"Bean vs. Morris, 221 U. S. 485.

"It was recognized by the statutes of the United States while Colorado and Wyoming were territories.

"United States vs. Rio Grande, 174 U. S. 690.

"Gutierres vs. Albuquerque, 188 U. S. 545.

"When Colorado became a state in 1876, in its sovereign capacity it became the owner, for the benefit of its people in common, of all the waters of the streams of the state.

"See—Walbridge vs. Robinson, 22 Ida. 240.

"Also—Colorado Enabling Act, Colorado Constitution, and Proclamation of President, supra.

"Colorado, in this suit, insists upon her claim to divert 91,000 acre-feet of water of this interstate stream. This is a reasonable exercise of her rights of sovereignty as to this interstate stream. She requires the water for necessary public uses. It will produce larger results within her boundaries than elsewhere. She is not unreasonably trespassing upon Wyoming in thus reasonably exercising her rights. The only reasonable way in which this right can be availed of is to apply the waters to lands lying within another watershed. The right to carry water to another watershed is necessary for its beneficial use within the State of Colorado.

"In Coffin, et al. vs. Left Hand Ditch Co., 6 Colo. 443, it is said:

> " 'The doctrine of priority of right by priority of appropriation for agriculture is evoked, as we have seen, by the imperative necessity for artificial irrigation of the soil. And it would be an ungenerous and inequitable rule that would deprive one of its benefit simply because he has, by large expenditure of time

and money, carried the water from one stream over an intervening watershed and cultivated land in the valley of another. It might be utterly impossible, owing to the topography of the country, to get water upon his farm from the adjacent stream; or if possible, it might be impracticable on account of the distance from the point where the diversion must take place and the attendant expense; or the quantity of water in such stream might be entirely insufficient to supply his wants. It sometimes happens that the most fertile soil is found along the margin or in the neighborhood of the small rivulet, and sandy and barren land beside the larger stream. To apply the rule contended for would prevent the useful and profitable cultivation of the productive soil, and sanction the waste of water upon the more sterile lands. It would have enabled a party to locate upon a stream in 1875, and destroy the value of thousands of acres, and the improvements thereon, in adjoining valleys, possessed and cultivated for the preceding decade. Under the principle contended for, a party owning land ten miles from the stream, but in the valley thereof, might deprive a prior appropriator of the water diverted therefrom whose lands are within a thousand yards, but just beyond an intervening divide.' 449-450.

"In the syllabus of the same case and supported by the opinion, it appears:

> " 'The right to water acquired by prior appropriation is not in any way dependent upon the *locus* of its application to the beneficial use designed.'

"Other cases in Colorado announcing the same doctrine are:

"Thomas vs. Guiraud, et al., 6 Colo. 530-532.

"Hammond vs. Rose, et al., 11 Colo. 524-526.

"Openlander vs. Left Hand Ditch Co., 18 Colo. 142-144.

"Coffin vs. Left Hand Ditch Co. is cited with approval In Moyer vs. Preston, 6 Wyo. 308, 313, 321; Willey, et al. vs. Decker, 11 Wyo. 496, 516, 528, 530.

"The Left Hand Ditch case is cited with approval in support of the doctrine that water may be diverted to non-riparian lands in Boquillas Cattle Co. vs. Curtis Co., 213 U. S. 339, 345; also 181 Fed. 1014, 1015.

"An exhaustive discussion of the practice and the law of inter-watershed diversions is set forth in Vol. 2 of this brief.

"We respectfully submit that when the law is applied to the facts in this case, it appears that the appropriations by Colorado to the irrigation and reclamation of its arid lands of 91,000 acre-feet of the run-off of the Laramie River is but a reasonable exercise of its sovereignty and does not constitute an unreasonable trespass upon the rights of Wyoming, and further, that she is simply availing herself of her own great natural resources in making this proposed diversion. The action should be dismissed at the cost of complainant."

COLORADO'S CONSTRUCTION OF WYOMING-COLORADO DECISION IN CASE OF COLORADO VS. KANSAS

At the October Term of this Honorable Court in 1927, Colorado, by leave of Court, filed, as complainant, her original bill of complaint against the State of Kansas, et al., and the following quotation taken from said bill sets forth Colorado's construction of the Wyoming-Colorado decree and the scope of the proceeding in that case.

Paragraph 7, Pages 17 and 18:

"* * * The propriety, political wisdom and economic necessity of maintaining and dealing with state rights in the interstate streams as a whole between the states only is recognized not only by the decisions of this Honorable Court in dealing with the controversy between Kansas and Colorado hereinafter referred to, but also the controversy between Wyoming and Colorado recently before this Court, * * *."

Colorado, in said Colorado vs. Kansas, case, argues that state rights in the interstate streams as a whole between the

states only are recognized, not only by the decision of this Honorable Court in dealing with the controversy between Kansas and Colorado, but also in the controversy between Wyoming and Colorado before this Court. Here Colorado cites the former Wyoming-Colorado case as authority for the contention that the question of determining the rights in interstate streams must be dealt with as a whole between states and that the question of rights of individual appropriators in the contending states cannot be recognized.

COLORADO'S POSITION ON THE QUESTION OF CONTROL AND OWNERSHIP OF FLOWING WATERS WITHIN THE STATE AS STATED IN CASE OF COLORADO VS. KANSAS, ET AL.

FLOWING WATERS OF STATE: PROPERTY OF THE STATE

Paragraph 5, Page 9:

"* * * today and from its admission to the Union, the State, by its Constitution and laws, has treated all of the flowing water in the state as the property of the state itself, permitting its citizens to acquire only usufructuary rights subordinate to the state ownership, given for the time being to private agencies but subject and subservient always to the dominant will of the State. * * *"

COLORADO'S RIGHTS IN WATERS OF INTERSTATE STREAM SUBJECT TO DECISIONS OF U. S. SUPREME COURT

Paragraph 5, Pages 9 and 10:

"* * * The State of Colorado * * * has by numerous acts of law and policy, supported by the interpretations of its courts, claimed the right to use within its borders and to distribute all of the waters originating and flowing therein to such of its citizens and inhabitants as it chose to select, without regard to the claims of the inhabitants or citizens of any other state, including the State of Kansas, and subject only to such limitations as

this Honorable Court might determine to exist between this State as a whole and other sovereign states as a whole, * * *."

DECISIONS OF STATE SUPPORT CLAIM OF STATE OWNERSHIP OF WATERS OF STATE

Paragraph 6, Page 11:

"These provisions have been frequently interpreted by the courts of the State as declaratory of the public policy that the waters of the streams of the State belong to and are controlled and properly administered by the State in its sovereign capacity as a matter of public and governmental activity. * * *"

ALL DIVERSIONS UNDER CONTROL OF PUBLIC OFFICIALS

Paragraph 6, Page 15:

"* * * No person desiring water can divert the same except, if, as and when authorized by the Water Commissioner, and in both theory and practice no water is diverted except by the order and direction of the public officials in control of the stream. * * *"

STATE IN SOVEREIGN CAPACITY OWNS FLOWING WATERS IN THE STATE

Paragraph 7, Page 15:

"Under said system of ownership and control of the streams by the State in its sovereign capacity * * *."

UPON DISCONTINUANCE OF USE WATER REVERTS TO FUND OF SOVEREIGN

Paragraph 7, Pages 16 and 17:

"* * * Moreover, upon discontinuance of use, the usufructuary privilege vanishes on principles of abandon-

ment, and under special proceedings provided therefor the right is cancelled on consideration of the special facts surrounding it, and the amount of water formerly diverted reverts to the common fund of the sovereign. • • •"

VARYING LOCAL CONDITIONS MAKE IT IMPERATIVE SETTLEMENT OF INTEREST IN INTERSTATE STREAMS BETWEEN SOVEREIGN STATES, NOT BETWEEN INDIVIDUALS

Paragraph 7, Pages 18 and 19:

"The recognition of the fundamental principles of ownership, control and administration of the waters of the streams by the States in their sovereign capacities, in conformity with local necessities, and for the general welfare of each of the States, and with administrative rules and statutes varying according to such local necessities and responsive only to the sovereign will of the States in which the use of the natural element is essential to the very existence of the State and its people, and free from claims of foreign servitude save only such as may be fixed by compacts between the states or by decision of this Honorable Court in suits between the sovereign states, not only comports with the fundamental principles of our Federal union of states equal in powers and in all other respects, but likewise comports with human experience in securing the maximum benefits from the use of this fleeting natural element as typified in the experience in the State of Colorado with its local administrative system. The principles of local government which are inherent in all American theory and practice, and the principles of local administration, are typified in the development of water administration thus evolved by a long series of practical experiments. There are immense geographical variances in location between individual users of water in Kansas and many of the principal individual priorities in Colorado, between whom a conflict might be conveniently sought, amounting to a difference between them of hundreds of miles of river channel in isolated mountain gorges or on the open prairie. The administration of rela-

tive usufructuary rights involves the consideration also of the fact that the water flows through different climatic zones subject to varying conditions of rainfall, heat and loss of water under meteorological occasions which vary both the need for water and the actual supply of water available from day to day and from hour to hour. Such factors render imperative the settlement of these matters between sovereign states and not between individuals."

Paragraph 8, Page 20:

"* * * this Honorable Court, in a notable decision and determination, duly made and entered May 13, 1907, duly held, adjudicated and decreed among other things that it had jurisdiction to consider and determine the question of the relative exercise of the sovereignties of the states of Kansas and Colorado upon the waters of the Arkansas River and its tributaries; that the states could and did in their sovereign capacities and as *parens patriae* of the citizens, inhabitants, and the interests and welfare of their population, represent and speak for the great number of persons and institutions in the respective states using the waters of the said river for beneficial purposes, and that the matters should be determined between the two states as a whole on the basis of their respective benefits in the said stream, their requirements and relative dependence thereon in view of climatic, geographical and other conditions, and the equitable principles governing the asserting of both sovereignties on the water flowing therein. * * *"

Paragraph 8, Page 22:

"* * * It was thereby duly adjudicated that the quantum of water represented by the appropriations and diversions existing and carried on within the State of Colorado under its authority in the year 1907 was within the lawful rights of the state, its corporations and citizens, and the continuance of such appropriations and diversions was in legal effect quieted to the State of Colorado, its corporations and citizens. * * *"

Paragraph 10, Pages 23 and 24:

"* * * Relying also upon the doctrine of the foregoing decision to the effect that the relative claims of the two states and the citizens and inhabitants thereof were fixed and determined forever as between the two states as units and were to be thereafter adjudicated and determined as a whole between the two states, and that the distribution within the two states of the benefits of the said river was and would continue to be a matter of internal administration within the limits of each, * * *."

RIGHTS OF INDIVIDUALS CANNOT BE RECOGNIZED

Paragraph 11, Pages 25 and 26:

"* * * Said defendant inhabitants have protested and objected thereto in the United States District Court, have constantly alleged that the matter was one as between the states from which the parties derived their respective rights, that the United States District Court had no jurisdiction in view of the action and determination of this Honorable Court, and that any attempted adjudication of the rights and acts of individual parties was beyond the jurisdiction of the lower courts, and no determination of their respective claims could be arrived at without the participation of the State of Colorado and the State of Kansas as such. The defendants in such cases have also urged what your complainant respectfully submits is the unquestioned fact that, in view of the determinations and actions of this Court, any attempt to adjudicate and put limits upon the rights of individual citizens of the two states could only produce confusion and uncertainty and disorder; that it was impracticable, if the states as a whole were entitled to certain relative benefits, to adjudicate as between the derivative benefits of the citizens thereof without affecting the whole and thereby adjudging the rights and duties of the states in the absence of both; that to permit such litigation was to recognize a right in private citizens of one state to assert and impose a servitude upon the territory and streams of a neighboring state without its consent and to recognize private claims

as independent of and superior to the rights of either state; that the Supreme Court had taken and retained jurisdiction over the controversy at the election and request of the sovereign states involved, and no other court had authority or jurisdiction to affect, diminish or disturb the balance of the rights of the said states except this Court, which alone had jurisdiction of the sovereign states involved."

COLORADO ADMITS JURISDICTION OF UNITED STATES COURT TO DETERMINE RELATIVE RIGHTS OF COLORADO AND KANSAS IN INTERSTATE STREAM

Paragraph 12, Pages 28 and 29:

"* * * the Court, over the objection of the defendants, assumed the right to determine the relative rights of the sovereign State of Colorado and the sovereign State of Kansas in the waters of the Arkansas River. * * *"

Paragraph 12, Pages 30 and 31:

"* * * the rights, history, acts and appropriations of the said plaintiff and also of all of the said defendants were involved in, presented, litigated, considered and determined in the course of the above mentioned original litigation between the states of Kansas and Colorado, and the consequences of the acts, diversions and claims of both were fully presented, involved and litigated in the above mentioned controversy wherein the states of Kansas and Colorado in their sovereign capacities appeared for and represented the acts and rights of their citizens as a whole, respectively. * * *"

INJUNCTION AGAINST INDIVIDUAL USE IN COLORADO WOULD DISRUPT ADMINISTRATION OF SOVEREIGN STATE

Paragraph 14, Page 38:

"* * * Any determination of the rights of individual Kansas appropriators against individual Colorado ap-

propriators alone is impossible of performance or intelligent obedience, would necessarily and immediately affect and confuse thousands of irrigation users every one of whose daily claim to water is interlaced and relative to those who might be sued and is varying every day and hour, and any court injunctions as between individuals in Kansas and those in Colorado would instantly collide with state officers of Colorado who are not and cannot be made parties, and would disrupt the administration of this sovereign state."

PRIVATE RIGHTS DERIVATIVE FROM SOVEREIGN STATE

Paragraph 17, Pages 42 and 43:

"Any private rights which may exist within the State of Kansas are derivative purely from the sovereignty of Kansas under such policy as it may adopt in regard to the riparian doctrine now in force or such other doctrine as it may from time to time in the future develop, and any and all such rights within the State of Kansas are, as in the case of Colorado, to be allocated to such quantum of water or use as the State of Kansas may be entitled to by compact between the states or by equitable principles adjudicated by this Court in a proper proceeding. Colorado and Kansas should both be free, by virtue of their inherent sovereignty which they have surrendered neither to the Federal government nor any other power, to adapt their domestic policy by such present or altered legal doctrines or present or altered administrative machinery as the problems of developing population, changing geographical conditions and other considerations may dictate. Relying upon the determination of this Court in the above mentioned litigation between Kansas and Colorado, Colorado has made great progress in the economic application, scientific use and development of its waters, and even great progress in the development of administrative machinery for the conservation and wise distribution of the quantum of water which it is entitled to divert from the Arkansas River. * * *"

COLORADO CONDEMNS PRIVATE LITIGATION INSTITUTED WITH CONSENT OF STATE OF KANSAS

Paragraph 17, Page 43:

"* * * Notwithstanding the solemn determination therein entered into, citizens of the State of Kansas, by their action have placed the State of Kansas in the position of acquiescing in private litigation in which it has nothing to lose and everything to gain, the result whereof might be to set aside the effects of the said determination between the states of Kansas and Colorado and thereby to place Kansas in the position of gaining by guerrilla warfare what it is forbidden to assert openly and officially as a sovereignty. * * *."

UNITED STATES SUPREME COURT ONLY TRIBUNAL WITH JURISDICTION TO DETERMINE DISPUTE BETWEEN COLORADO AND KANSAS

Paragraph 17, Page 44:

"* * * If the State of Kansas has complaints against the State of Colorado because of diversions within the State of Colorado, or the interpretation given to said adjudication by the State of Colorado, she is bound, by her election and by the express reservation of jurisdiction made by this Court in the case of Kansas against Colorado, to submit any and all such complaints to this Court and this Court only."

Paragraph 18, Page 44:

"* * * the defendant individual appropriators and users of water of the Arkansas River whose rights are derivative from and wholly dependent upon and included within the authority of the State of Colorado. * * *."

COLORADO ADMITS DECREE ENTERED AGAINST STATE IS BINDING UPON ALL WHOSE RIGHTS ARE DERIVED FROM THE STATE

Quoting from Page 15 of the Reply of Colorado:

> "* * * Colorado alleges that none of the said persons or corporations are necessary or proper parties to this cause; that if any should be made parties, all should be made parties, but respectfully represents that, as all of the said rights are derivative from and would be bound by any adjudication or determination against the State of Colorado, it would unnecessarily encumber these proceedings to make any of them parties hereto, * * *."

This Honorable Court, in substance, sustained this contention as advanced by Colorado as to the necessity of making individuals parties in the Colorado-Kansas case, now pending, when it overruled the motion of the defendant, State of Kansas, to have certain named individual water users from the Arkansas River in the State of Colorado made parties to the pending action.

In the case at bar, Colorado contends that even though she, in her quasi-sovereign capacity, represented all of her citizens and all of her interests, in the former Wyoming-Colorado case, the only question determined in the controversy was as to the relative rights on a basis of priority between the appropriators of Wyoming as a whole and the single Colorado claim of the Laramie-Poudre Tunnel Diversion; that the Court did not intend to, and did not limit the rights of any other individual appropriators in the State of Colorado to divert and use the waters of the Laramie River and its tributaries within the boundaries of Colorado.

The analysis of said decree, 259 U. S. 419, in Colorado's petition for a re-hearing, is proof that Colorado's present contention is one of necessity and convenience in an effort to justify her disregard of the terms of said decree.

Colorado, Page 3 of her brief, in support of the motion to dismiss plaintiff's bill of complaint, states:

> "Paragraphs Three to Seven undertake to state the substance and effect of the former decree of this Court.

"In this statement we criticize the allegation in the Fifth paragraph that the Court found that there was a 'total available annual supply of water for irrigation of lands in Colorado and Wyoming from the Laramie River and its tributaries in the total sum of 310,250 acre-feet of water; * * *.'"

The statement criticized is in almost the identical language used by Colorado in her petition for re-hearing, which we have quoted in this brief, supra.

Also, on Page 3 of Colorado's brief in support of said motion, she states:

> "The issues joined in that case did not permit of an adjudication limiting vested rights of those not parties to that litigation nor represented therein, nor did the Court, by anything said in the opinion, intend to work a specific division of the water of this stream between the two states."

At Page 26 of defendant's brief, counsel in support of this contention mis-quote the language of said decree in commenting upon the status of the Skyline Diversion in the amount of 18,000 acre-feet, where it is said:

> "It is impossible to place this appropriation in the same category as that of the tunnel. In the decision of this Court in the former action, it is recognized that the tunnel appropriation will receive its full measure of water allocated to it in all years, and that 'the Wyoming appropriations will receive the water only after it passes down into that state, and must bear whatever risk is incident to the variation of the natural flow.' * * *
>
> "The Court there reached a practical solution whereby the tunnel appropriator had to sacrifice the normal right to take up to the limit of its projected development after all prior rights should be satisfied, and yet it obtained what the Court regarded as equivalent, namely, in effect a preference right to a defined extent. But in the case of the Skyline Ditch there would be no opportunity to balance rights. The Water Supply & Storage Company, owner of this ditch, is unquestionably senior to all except a very few Wyoming appropriations."

The above quotation from defendant's brief is the comment of counsel for defendant upon the language of the decree, 259 U. S. Rep., Page 485, where the Court said:

> "There is one respect, requiring mention, in which Colorado's situation differs materially from that of Wyoming. The water to satisfy the Colorado appropriation is, and in the nature of things must be, diverted in Colorado at the head of the stream; and because of this those appropriations will not be affected by any variation in the yearly flow, but will receive their full measure of water in all years. * * *"

In using the above language the Court was not speaking of the tunnel appropriation only, when it said "the Colorado appropriations", "those appropriations", "their full measure of water". The difference between the language of the decree referred to by Colorado and the interpretation which she places thereon, is that Colorado, in commenting upon this language, says that the Court was talking about the tunnel appropriation, which would receive its full measure. There is no such statement in the decree. The Court speaks of all of the Colorado diversions; the defendant is in error in treating this language as applying to the tunnel appropriation only.

The comment of Colorado, Page 26 of her brief, as to the Tunnel Diversion, is in substance what the Court determined as to all recognized Colorado diversions, that Colorado was guaranteed water for the diversion through the Skyline in the amount of 18,000 acre-feet annually, 4,250 acre-feet annually for the irrigation of meadow lands in Colorado, and the 15,500 acre-feet annually through the Tunnel Diversion, because in all years, both those of scarce precipitation and of abundant rainfall, Colorado could be assured of her ability to take from the headwaters of the Laramie River the full limit fixed by the Court as the annual Colorado allotment, namely, the 37,750 acre-feet, the exact amount which Colorado admitted herself entitled to in her petition for re-hearing.

The single question presented to this Honorable Court is whether Colorado's relative right to the use of the waters of the Laramie River is limited to 37,750 acre-feet per annum, or is the only limitation on Colorado, the 15,500 acre-feet annually, allowed for the tunnel.

On Page 14 of the brief of Colorado, she criticizes Wyoming's position in saying:

> "The complainant, * * * is not willing, * * * to ground its claim solely upon the basis that the former decree was effective to define and limit all other diversions in Colorado taking water from the Laramie, * * *."

On the contrary, Wyoming in this proceeding rests her claim for relief solely upon the contention that the allocated portion of the water to which citizens or corporations, diverting water under the laws of Colorado and under her supervision and with her consent, are limited to the aggregate amount which this Court in said former Wyoming-Colorado decree found as her relative right or equitable interest in the use of the waters of that stream, to be the amount of 37,750 acre-feet annually, and that Colorado, through her officials charged with the administration of the diversion and use of the water of the Laramie River, in Colorado, is ignoring the decree of this Honorable Court which determined the said relative rights of the complainant and defendant in the use of the waters of this interstate stream.

Colorado's understanding of Wyoming's position as portrayed at Page 16 of Colorado's brief, is in error, as Wyoming has never contended that through oversight, or otherwise, in the drafting of the former decree, it was not intended to fix a limitation on all appropriators in Colorado diverting water from the Laramie River, under the control of and with the consent of Colorado.

This Honorable Court would not assume in the entering of said decree that there would be any attempt upon the part of either Wyoming or Colorado to take advantage of the Court's findings as stated in said former decision, by attempting to divert quantities of water in excess of the stated relative amount annually allotted for diversion and use in each of said states, or that either state would construct and operate other and additional means of storage and diversion to take and divert quantities of water from the Laramie River without regard for and in addition to the fixed annual allotments.

Colorado, in the former Wyoming-Colorado case, stated to the Court in connection with the proposed diversion by the Skyline Ditch, as follows:

"* * * The average possible diversion through this ditch is 16,000 acre-feet annually."

In speaking of the total annual diversion by means of the Skyline ditch, 16,000 acre-feet annually, and Sand Creek Diversion, 4,000 acre-feet annually, Colorado stated to the Court:

"* * * These diversions cannot be enlarged. * * *" (See Vol. 1, Page 3, Colorado Brief, Original No. 7)

Colorado, Page 26 of her brief, comments upon the amount of diversions through the Skyline ditch during the years from 1903 to 1912, in support of her contention that the same was not limited to 18,000 acre-feet. Witness A. A. Edwards for Colorado in the former Wyoming-Colorado case, supra, at Page 596, Vol. 1 of the Evidence, stated that the former measurements of discharge from the Skyline ditch were in error, but inasmuch as the Water Supply & Storage Co. was entitled to divert from the Poudre River an amount equivalent to that discharged into the Poudre River from the Laramie, no effort to verify the Laramie measurements were made. This Honorable Court gave due consideration to this evidence in determining the relative rights of these states in the waters of the Laramie River in the former Wyoming-Colorado case. (See Opinion, Vol. 66 L. Ed. U. S. Reports, Page 1016; 259 U. S. Reports, Page 471).

COLORADO'S VESTED RIGHTS

Colorado states that the decree in the former Wyoming-Colorado case does not include and control the rights of all appropriators of water from the Laramie River in Colorado under the laws of Colorado, because such rights are in the nature of vested property rights.

The Constitution of the State of Colorado, as construed by the Supreme Court of that state, provides that waters of Colorado belong to the State in its sovereign capacity, and the State grants to the appropriators of its water the right to its use, and nothing more.

No. 7, Original, Wyoming vs. Colorado, Brief of Defendants, Page 121:

"The defendants feel that priority of right as between users in different states has no place in a suit between sovereign states affecting the water of interstate streams, except possibly, that the relative priorities might be one of many factors from which the court would determine the reasonableness of the use in one state as against another, or, in other words, might be one factor in determining the equities between the states."

No. 5, Original, Wyoming vs. Colorado, Brief in answer to brief of the United States, Page 43:

"* * * In Colorado, and we think the same is true of all the arid States, the individual appropriator is but a cog in the machinery or process of irrigation development. He has no independent exclusive right to water, to do with it as he likes, as he may with all other forms of property. On the contrary, he is deemed to be using a public fund, and he must use it to the satisfaction of the public, and he is not left to determine that matter for himself. The State, in the person of its water officials, superintends his taking of water and must be daily satisfied that it is then necessary to his use. If he ceases to use it for an unreasonable time, his right ceases and the water returns to the common fund. He is never free from an obligation to the State and its citizens, as well as to those who are making a like use of the public waters. * * *"

Section 5, Article XVI, Constitution of Colorado, is as follows:

"The water of every natural stream, not heretofore appropriated, within the State of Colorado, is hereby declared to be the property of the public, and the same is dedicated to the use of the people of the state, subject to appropriation as hereinafter provided."

This provision of the Constitution has been construed a number of times by the Supreme Court of Colorado. One of the late cases so construing it, being a controversy over the rights to the use of the waters of a natural stream in Colorado, is Bowers v. McFadzean, 82 Colo. 138. At Page 142, the Court says:

"* * * Curby's (through whom one of the parties claimed his right) title or right to the use of water of the natural streams in the State of Colorado, did not come from the United States, but from the State of Colorado which is the owner in its sovereign capacity of the waters of all of its natural streams, and it is only the right to the use of the water that it permits appropriators to acquire. The ownership of the water itself of all our natural streams still is in the State of Colorado. * * *"

And Colorado acknowledges that her ownership and control of the waters of this interstate stream within the state is subject to the jurisdiction of this Honorable Court:

Wyoming vs. Colorado, et al, supra.
Colorado vs. Kansas, Bill of Complaint, Page 9, Paragraph 5; Pages 42 and 43, Paragraph 17; Reply of Colorado, Page 15.
Missouri vs. Illinois, supra.
Kansas vs. Colorado, supra.
Georgia vs. Tennessee, supra.

The last three authorities are cited by Colorado on the question of ownership and control of interstate streams by sovereign states.

(See Colorado brief, Vol. 1, Page 132, former Wyoming-Colorado case).

That in determining the relative rights of contending states to the use of the water of an interstate stream, this Honorable Court does not recognize so-called vested rights of the state appropriators is held in the case of Connecticut vs. Commonwealth of Massachusetts, decided February 24th, 1931, wherein it is said:

"But the laws in respect of riparian rights that happen to be effective for the time being in both States do not necessarily constitute a dependable guide or just basis for the decision of controversies such as that here presented. The rules of the common law on that subject do not obtain in all the States of the Union, and there are variations in their application. The doctrine of appro-

priation prevails in some States. And every State is free to change its laws governing riparian ownership and to permit the appropriation of flowing waters for such purposes as it may deem wise. United States v. Rio Grande Irrig. Co., 174 U. S. 690, 702, 43 L. Ed. 1136, 1141, 19 S. Ct. 770.

"For the decision of suits between States, federal, state and international law is considered and applied by this court as the exigencies of the particular case may require. The determination of the relative rights of contending States in respect of the use of streams flowing through them does not depend upon the same considerations and is not governed by the same rules of law that are applied in such States for the solution of similar questions of private right. Kansas v. Colorado, 185 U. S. 125, 146, 46 L. Ed. 838, 846, 22 S. Ct. 552. And, while the municipal law relating to like questions between individuals is to be taken into account, it is not to be deemed to have controlling weight. As was shown in Kansas v. Colorado, 206 U. S. 46, 100, 51 L. Ed. 956, 975, 27 S. Ct. 655, such disputes are to be settled on the basis of equality of right. But this is not to say that there must be an equal division of the waters of an interstate stream among the States through which it flows. It means that the principles of right and equity shall be applied having regard to the 'equal level or plan on which all the States stand, in point of power and right, under our constitutional system,' and that, upon a consideration of the pertinent laws of the contending States and all other relevant facts, this court will determine what is an equitable apportionment of the use of such waters. Wyoming vs. Colorado, 259 U. S. 419, 465, 470, 66 L. Ed. 999, 1013, 1015, 42 S. Ct. 552."

COLORADO DENIES EXISTENCE OF VESTED RIGHTS IN INDIVIDUAL WATER USERS UNDER LAWS OF COLORADO

In the case of The La Plata River and Cherry Creek Ditch Company v. M. C. Hinderlider, as State Engineer of the State of Colorado, et al., supra, the plaintiff is prosecuting an ac-

tion to enjoin the State Engineer of Colorado and other named state water officials of the State of Colorado from interfering with its alleged vested rights acquired by reason of an adjudicated decree from a court in the State of Colorado, having jurisdiction to issue an adjudicated Water Right Decree. The defendant officers, through the Attorney General of the State of Colorado, deny the existence of the alleged vested rights in the plaintiff, and we quote as follows from the brief of the Attorney General of Colorado in support of the action of said water officials and in denial of the alleged vested rights of the plaintiff:

Pages 2 and 3:

"Plaintiff in error, The La Plata River and Cherry Creek Ditch Company, a mutual ditch company organized as a Colorado corporation, diverted water from La Plata River and applied it to a beneficial use for irrigation purposes upon a mesa known as Thompson's Park in southwestern Colorado, and thereafter received a decree therefor from the La Plata County District Court.

"La Plata River is a tributary of the San Juan. It rises in La Plata mountains and flows thence south into New Mexico to join the San Juan a short distance west of Farmington. It waters lands in both states. Irrigation was developed in New Mexico during the time when most of the arable lands in La Plata drainage in Colorado were included within the Ute Indian Reservation, and were not open to development.

"Subsequently, the Indian Reservation was opened to settlement and numerous canals were constructed in Colorado, and the diversion of water through their headgates caused friction between appropriators in the two states and later between the states.

"When a question arose as to the division of the flow of the river because of the claims of individual water users on opposite sides of the interstate line, the states, as the representatives of their citizens, assumed the settlement of the problem and by proper legislative action provided for the appointment of commissioners to equitably apportion the waters between the contracting states. The legislatures of the two states approved the agree-

ment as drafted by their commissioners, and the Congress of the United States thereafter ratified it on January 29, 1925.

* * *

"By the compact each state is allowed a definite share of the river flow under the varying conditions which obtain during the irrigation season. Under paragraph 3 of Article 2, however, it is provided, that, if in the opinion of the State Engineers it will be to the best interests of the contracting states, the stream flow may be rotated between the two states under conditions to be fixed by them.

"Since its approval by Congress, the waters of the river have been divided and distributed between the states in conformity with the Compact, the water officials in each state distributing its share among the appropriators according to local laws and court decrees.

"In making interstate divisions during the hot summer months when the river supply is very low, the State Engineers of Colorado and New Mexico have rotated the available supply pursuant to this provision. The water has been shut off from the ditches in each state in alternating periods of time, and plaintiff particularly complains of being deprived of its water supply when the total flow is passing to New Mexico under the rotation arrangement.

"In June, 1928 when the headgates in Colorado were closed to permit the entire flow to go down stream to New Mexico under a rotation agreement, the Ditch Company commenced this action against the State Engineer and his subordinates. It was alleged that they were taking plaintiff's water and delivering it to others contrary to the decreed rights on the river and because of the injury resulting therefrom a bad for an injunction."

Page 6:

"The defendants admitted the closing of the headgate, alleged the Compact to be the law of the river and sought to justify their conduct under its terms. They denied however, that they had ever distributed water among the water users in this state except in strict conformity with the decrees of court."

Colorado in the case at bar denies that the decree of this Honorable Court is the law of the Laramie River, although she pleads the New Mexico-Colorado Compact as justification for her acts and conduct on the La Plata River.

Pages 6 and 7:

"THE ISSUE

"This put the validity of the compact directly in issue and the interesting question was raised as to the powers of the states, in matters involving their rights and those of their citizens, to assume the business of making a settlement.

"When sovereign entities disagree the ultimate settlement is by a resort to arms.

"But by the adoption of the Constitution and by their consequent relinquishment of certain of their attributes of sovereignty, all of the original thirteen states, and, of necessity, every state thereafter admitted into the Union, surrendered the right to wage war.

"There were left, then, two methods for settling the question. The first was by an original suit before the Supreme Court of the United States with the two states aligned on opposite sides as parties, and the second by a compact between the States.

"In many instances states have gone into that court for the settlement of disputes. The cases of Kansas v. Colorado, and Wyoming v. Colorado, and the pending case of Colorado v. Kansas furnish the outstanding examples of the application of the first method in the solution of problems involving irrigation streams."

CONTROVERSY OVER USE OF WATERS OF INTERSTATE STREAMS CANNOT BE SETTLED BY INDIVIDUALS

Pages 8 and 9:

"This controversy over the opposing claims of water users along La Plata on either side of the state line could not be settled by the individuals involved. And the states,

in the roles of *parentes patriae*, were called upon to employ one of the two methods left available for the solution of the problem. The legislatures of the two states determined to exercise the treaty-making power and Commissioners were appointed to treat.

"The defense is based squarely upon the terms of that compact. If the states had no power to treat, or if the agreement, when approved and ratified, could not, and did not, bind the rights of the citizens of the two states, then the defense must fail."

Pages 10 and 11:

"In concluding interstate river compacts the states proceed upon this fundamental basis of state ownership of the waters under consideration and upon the principles that each appropriator and user of water within the state obtains his right of use from the state in which the diversion and use occur; that each state upon an interstate stream possesses and exercises its sovereignty over an equitable portion of the waters of that stream; that such portion is undetermined until fixed by interstate compact or by decisions of the Supreme Court of the United States; that each appropriator initiates and perfects his usufructuary rights, with full knowledge and notice of the interstate character of the stream and of the limitations upon the rights of his state; that determination of the rights of his state determines his rights, and that he must look for his supply from the portion determined to be subject to the sovereignty and control of his state."

Page 11:

"Further, that the rights of the appropriator vest subject to such interstate determination (past or future). And this determination, when made, relates back to the beginning of statehood and is presumed to have existed since the birth of the nation. This principle is analogous to that applied in boundary cases."

Pages 11 and 12:

> "* * * Each state is the source of title in respect of the rights of its several appropriators of waters of the river, and each state did not and could not grant any greater title than it had to convey. The rights of each appropriator vested with full knowledge and notice that his rights were subject to future definition of the equitable sovereignty of his state and would be bound by and subject to such determination, whether by interstate agreement or by decisions of the Supreme Court sitting in original jurisdiction in a case between Colorado and New Mexico."

The controversy in the case at bar would be quickly disposed of, if Colorado would apply the same reasoning as is set forth in the last above quotation.

On the Laramie River, as on the La Plata River, the rights of each appropriator vested with full knowledge and notice that his rights were subject to future determination of the equitable rights of his sovereign state and would be subject to such determination, whether by interstate agreement or by decisions of this Honorable Court, sitting in original jurisdiction in a case between Wyoming and Colorado.

Page 12:

> "Determination was affected by compact and the equitable apportionment thereby made, whether by division of daily flow or by rotation of use of the entire flow in alternating periods between the signatory states, is binding and obligatory upon each state and all its appropriators of waters of the river. The compact may be enforced by original interstate suit in the Supreme Court, and rights which have vested under its provisions are obligations protected by the Constitution.
>
> "It is defendants' theory, then, that the state acted within its powers in defining the limits of the interests of the two states on La Plata, that the plaintiff is bound thereby and that no vested right has been taken because the water in controversy belongs to New Mexico. Colorado's water administration officials are carrying out the law of the river and no injunction will lie."

Page 24:

"Now the Ditch Company asks: How can the state, after issuing a decree therefor, deprive plaintiff of its vested right to irrigation water?

"This is the real question in the case. Upon its analysis and solution depend the rights of the parties here.

"Admittedly there are no cases involving irrigation water rights to which we may turn for the answer but the determining principles have been considered by the United States Supreme Court on several occasions and their application to this situation is clear."

Page 26:

"This put the compact powers of the state directly in issue. The result is a series of judicial pronouncements by the United States Supreme Court which we claim are controlling in the case at bar. The outstanding cases are Poole v. Fleeger, 11 Pet. 185 and Coffee v. Groover, 123 U. S. 1, and we point to them as determinative."

Complainant contends that the cases last above cited from Colorado's Attorney General's brief in the La Plata case, supra, as effectively support Wyoming's position in the case at bar, to the effect that Colorado individual appropriators on the Laramie have no vested rights except as modified by the limits of the title of the State of Colorado in this interstate stream, as do also the following:

Pages 39, 40 and 41:

"TITLE OF THE STATE

"Basing his contentions upon the two propositions, that an appropriator of irrigation water derives his title from the United States, and that the state parted with whatever interest it may have owned therein when its court decreed the water right to the plaintiff, counsel would confine the effect of the Colorado-New Mexico Compact to the unappropriated waters of La Plata River and deny to the states the right to deal with all the waters of the

stream as a whole, so as to bind the owners of decreed water rights.

"To meet this argument, it becomes necessary, not only to investigate the origin of interstate compacts and to trace the history of their exercise since the adoption of the Constitution, but, also, to analyze the source and character of the right to divert water for irrigation purposes in Colorado.

"It would seem that the question of the ownership of the waters of the natural streams in Colorado should be foreclosed in Colorado's courts, but, because of the manner in which the question has been raised here, it is probably not out of place to suggest the line of authority which supports the state's claim to the ultimate title in the water.

"The original appropriation of water upon which plaintiff's decree is based was dated June 2, 1890, and so was subsequent, in time, to the admission of Colorado into the Union, and consequently the water was unappropriated at the time of the adoption of the State Constitution in 1876.

"In other words, the water in controversy here was of the character defined in that clause which declared that the water of every natural stream, not theretofore appropriated, was the property of the public and expressly dedicated it to the use of the people.

> " 'The water of every natural stream, not heretofore appropriated, within the state of Colorado, is hereby declared to be the property of the public, and the same is dedicated to the use of the people of the state, subject to appropriation as hereinafter provided.'
>
> Article XVI, Sec. 5, Colorado Constitution."

Pages 45 and 46:

"Our Constitution dedicates all unappropriated water in the natural streams of the state 'to the use of the people,' the ownership thereof being vested in 'the public.'

Wheeler v. Northern Colo. Irrigating Co., 10 Colo. 582, 587, 17 Pac. 487.

"Under our Constitution the water of every natural stream in this state is deemed to be the property of the public. Private ownership of water in the natural streams is not recognized. The right to divert water therefrom, and apply the same to beneficial uses, is, however, expressly guaranteed.

Fort Morgan Land & Canal Co. v. South Platte Ditch Co., 18 Colo. 12, 30 Pac. 1032.

Coffin v. Left Hand Ditch Co., 6 Colo. 443.

Hammond v. Rose, 11 Colo. 5241, 19 Pac. 466.

Beaver Brook Co. v. St. Vrain Co., 6 App. 130, 40 Pac. 1066."

Pages 52, 53 and 54:

"COLORADO MAY NOT TAKE ANOTHER'S WATER

"The chief concern is to determine the exact nature of the title which the plaintiff in error acquired when it diverted water from La Plata River for irrigation purposes.

"Because this Court has defined the right which an appropriator of water acquires as a vested interest, counsel for plaintiff maintains that such title is absolute. In testing this position the exact character of title which the water user's predecessor possessed becomes important.

"If, as defendants contend, the interest of the appropriator was acquired under the provisions of the Colorado Constitution, and was defined by the terms of a decree of a court which functioned by virtue of that same instrument and the statutes passed in conformity therewith, then the extent of the title which Colorado, itself, possessed in the waters of this interstate stream in the first place, and which passed in part to the plaintiff in error under its water decree furnishes the guide for determining this question.

"It is the position of defendants that Colorado, by reason of its sovereignty, is the owner of the waters of its non-navigable streams, subject only to an interest existing in favor of adjoining states upon such streams as

cross state lines. Therefore, the water used by the plaintiff company has always been and now is the property of the State. And whatever right or title accrued to plaintiff was acquired from the State of Colorado, whether claimed by reason of its appropriation and application to a beneficial use, only, or under the decree from the La Plata County District Court.

"To sustain the contention of plaintiff that a Colorado water user acquires an absolute title, one must carry the reasoning to its ultimate conclusion, and assert that Colorado owns all the water of its interstate streams or else that its court decrees had the effect of confirming an absolute title to the entire river flow in defining the rights acquired from the Federal government.

"No state may claim the ownership of all the waters of a stream which crosses its borders into or from a sister state however. The United States Supreme Court made this clear on two different occasions when Colorado asserted the right to take all of the waters of the Arkansas and the Laramie Rivers, if the needs of its citizens demanded. And in a case decided on May 4 of this year, Mr. Justice Holmes referred to the decisions in those two cases in defining the limits of the rights of the states of New York, New Jersey and Pennsylvania on the Delaware River. The rule announced in the Kansas case and followed consistently thereafter is that each state possesses and exercises an equitable sovereignty over the waters of an interstate stream which must be recognized and respected by everybody.

"From this it follows that New Mexico, by reason of its sovereignty, now owns, and has always owned, an equitable interest in the waters of La Plata River which limits and defines the rights of Colorado and its citizens therein. And by the same token, Colorado exercises sovereignty over an equitable portion of that stream which limits and defines the rights of the lower state and its citizens."

Pages 88 and 89:

"STATE'S RIGHT SUPERIOR TO INDIVIDUAL

"The principles urged by plaintiff would make the jurisdiction of the State of Colorado inferior and subservient to superior and dominant claims of each and every appropriator and user of water in the state.

"These alleged rights of individuals are said to have vested under Acts of Congress, the supreme law of the land, and to be largely immune from state jurisdiction.

"Such a theory is not in accord with the principles under which Colorado's water system has been built up and is directly contrary to its statutes, court decisions and customs and has no support from the Federal enactments and decisions.

"QUESTION IS ONE OF STATE AND NOT OF INDIVIDUAL RIGHTS

"Plaintiff says that the rights of New Mexico and its citizens may not be considered here since they are not parties to the record; nor will defendants be relieved from the consequences of their actions in closing plaintiff's headgate merely by showing that certain absentees had an interest in the water which may have been superior to that of the plaintiff.

"Our answer is that, when a citizen of one state claims the water of a citizen of another state it ceases to be a controversy between individuals and becomes a question between the states.

"And when, as in this case, the extent of their interests has already been determined between the states in their sovereign capacities, it is unnecessary to again call in New Mexico in order to settle a question arising out of the claim of a Colorado citizen in a suit to force a state official to do something which would violate that agreement.

"Poole v. Fleeger, supra—Opinion by Baldwin, J.—211."

Page 96:

"DECREE HAS NO EXTRA-TERRITORIAL EFFECT

"If, as defendants claim, Colorado never possessed any interest in the water of La Plata beyond that which the compact defines, then its courts had no jurisdiction over that portion of the flow, which by the terms of the compact is declared to belong to New Mexico.

"To attempt to assert any such authority would be to say that the laws and courts of Colorado possess extra-territorial qualities and powers. But the rights of water users which are based upon a decree from a Colorado court are necessarily limited and determined by the jurisdiction of that court and the extent of the subject matter with which the court was dealing.

"As said by Mr. Justice Brewer in Kansas v. Colorado, supra, each state has full jurisdiction over the beds of streams and other waters within its borders but it can impose its own legislation on none of the others and is bound to yield its own views to none. This very inability of any state to extend its powers beyond its borders requires the inter-position of the Supreme Court in case where the states do not settle their rights by treaty."

Pages 100 and 101:

"SOURCE OF PLAINTIFF'S TITLE RELATIVELY UNIMPORTANT

"Our contention is that, whether the title of the water user is deraigned from the state or from the United States through the intermediate agency or channel of state law, the effect is the same—the title of the appropriator is no better in one case than in the other.

"If deraigned directly from his state, his title is always subject to interstate determination, either by an interstate compact or, by decision of the Supreme Court of the United States in original proceedings between the states.

"If deraigned from the United States through the medium of state law, the laws of the state and the limits of its jurisdiction are impressed upon the title of the appropriator. In either case he takes subject to the limitations upon the title of the state, *and as grantee* (using the term qualifiedly)—can receive no greater title than his grantor had to convey.

"The deraigning of title from the United States would give him no preferential status for the reason that by the Acts of 1866 and other Congressional enactments, the title would be made to rest according to the customs, laws and decisions of the courts of the several states and territories.

"While he might maintain that those acts were merely confirmatory of the jurisdiction of the states which already existed (See Kansas v. Colorado, Gutierres v. Albuquerque, U. S. v. Rio Grande Irr. Co., all supra), nevertheless, if it be said that these newer states were not equal in all respects with the original thirteen states, and that the United States retained a perpetual and dominant control over every stream within their borders—both navigable and non-navigable—even under such a narrow construction, the Acts of 1866 and those which followed, make the title of the appropriator filter through and partake of the infirmities of state laws and jurisdictions.

"The claim, then, that Colorado, by administering the La Plata River according to the terms of the compact is divesting plaintiff of a vested right answers itself. Even if we concede that the rights in question had vested as far as Colorado and its citizens are concerned, nevertheless the title of the plaintiff must give way before the requirements of the compact since the water which it claims has always belonged to New Mexico."

Pages 154 and 155:

"MISCELLANEOUS

"Let us consider what would have happened if the states had not caused the flow of La Plata to be equitably apportioned by a compact. When Colorado citizens con-

tinued to divert the flow of the stream to the injury of its citizens, New Mexico would have gone into the United States Supreme Court and commenced an original suit.

"Assuming that the Supreme Court had entered a decree *embodying substantially the* terms of the compact, would Colorado or its citizens be heard to object if a court official, acting under the decree, were to close the headgates in Colorado for ten days so as to permit all the water to be used in New Mexico in harmony with a finding that such a plan of rotation was proper and equitable?

"The question answers itself. The two states and their officials would be bound to obey the decree of that court. • • •"

Complainant has quoted at length from the bill of complaint and reply of Colorado as filed in the pending case of Colorado v. Kansas, et al., and from the brief of the Attorney General of the State of Colorado in the La Plata River case, pending in the Supreme Court of the State of Colorado, for the reason that the position of the defendant in the case at bar seems conclusively impeached by her position in each of these controversies. Supplementing Colorado's positions, as there reflected, by her plea and argument in the petition for a re-hearing in the former Wyoming-Colorado case, supra, would seem sufficient to make Colorado refrain from attempting, under the contention for vested rights and lack of jurisdiction, to justify her admitted taking of that portion of the water of the Laramie River which this Honorable Court determined belonged to the State of Wyoming.

Defendant declares, at Page 52 of her brief in the La Plata case, supra, that COLORADO MAY NOT TAKE ANOTHER'S WATER, and in her brief in the case at bar, she asserts that the action of individual citizens who were not named defendants in the said former Wyoming-Colorado case, are beyond the reach of the jurisdiction of this Court.

In the La Plata case, the controversy involved the scope and validity of an interstate compact; in the case at bar, the enforcement of a decree of this Honorable Court is involved.

Colorado says, at pages 154 and 155 of the Attorney General's brief in the La Plata case:

"Assuming that the Supreme Court had entered a decree embodying substantially the terms of the compact, would Colorado or its citizens be heard to object, if a court official, acting under the decree, were to close the headgates in Colorado for ten days so as to permit all the water to be used in New Mexico in harmony with a finding that such a plan of rotation was proper and equitable?

"The question answers itself. The two states and their officials would be bound to obey the decree of that court. • • •"

In the case at bar, we do not have to assume that a decree was entered. Colorado, notwithstanding the entry thereof in effect says that her citizens do not have to obey such decree, but can continue to take the water that belongs to the State of Wyoming. While she argues that her citizens may not take the water that was determined by compact to belong to New Mexico, Colorado attempts to distinguish between the solemnity of the La Plata Compact on the one hand, and the decree of this Honorable Court on the other, and thereby justify her position in the case at bar.

In complainant's second cause of action, she petitions this Honorable Court that an adequate method for the correct measurement of water diverted from the Laramie River into the Poudre River be installed and maintained, to the end that no further illegal and/or excess diversions be accomplished. Defendant, Page 21 of brief, in support of her motion to dismiss, states that this is not an independent cause of action, but presents merely an aspect of the remedy sought; that it must stand or fall with the principal issue.

The allegations of the bill as to excess diversions, are criticized as being insufficient to warrant the attention of this Honorable Court, stating that if Wyoming is not right in her contention as now made, little difficulty would be experienced in the measurement of the flow through the tunnel.

Paragraph Nine of the bill alleges that Colorado, through her officials, has failed to keep accurate records from which it can be determined what the actual diversion for any one year has been from the Laramie River to the Poudre River, and that unreported quantities of water have been, by the officials of defendant, permitted to be diverted through the tunnel.

At Page Five of Colorado's brief, counsel comment that in the event of discrepancy as to the amount of water diverted from the Laramie River into the Poudre River, it is because the Division Engineer has control over the Water Commissioner, and that the duty is cast upon the Water Commissioner of the District to keep a record of the amount of water turned into his district from any other district (citing Section 1704, C. L. 1921). This section is as follows:

> "It shall be the duty of the water commissioner of the district in which the water is used to keep a record of the amount of water so turned into his district from any other district."

Also, in support of the contention that the report of the Division Engineer should be accepted over that of the Water Commissoiner, Defendant cites Section 1838, C. L. 1921. This statute provides:

> "All water commissioners shall make reports to the superintendent of irrigation of their division as often as may be deemed necessary by said superintendent. * * *" (Remark—the Division Engineer has replaced the Superintendent of Irrigation.)

The Division Engineer has construed the above provision of said Section 1838 as discretionary only, stating that the Water Commissioner of District No. 3, which receives the diversions from the Laramie River in District No. 48, is not required by law to make any report to the Division Engineer; and inasmuch as defendant seeks to characterize the allegation of the bill relating to the necessity for an accurate measurement as unreliable, we feel justified in commenting that, notwithstanding the provisions of said Section 1838, C. L. 1921, commanding the Division Engineer to carefully file and preserve such reports, the complainant, in her search for these records as to trans-mountain diversions, including the tunnel, was advised by a Colorado official in charge of the administration of water received from the Laramie River diversions, that all records relating to such trans-mountain diversions for years prior to 1926 had been destroyed. And we call attention to the Twenty-fifth Biennial Report of the

State Engineer of Colorado for the years 1929-1930, at Page 290, from which we quote:

> "All annual reports from the Water Commissioners, with the exception of Districts 23 and 48, have been received. The Commissioner of District No. 48, which comprises North Park, is rarely called, so that the data for the preparation of an annual report is not available."

In commenting upon the above quotation, we may state that District No. 48 does not comprise North Park, as there stated, but is the district in which diversions from the Laramie to the Poudre are effected.

In view of the fact that the Division Engineer has construed the Statute relating to reports from the Water Commisisoner to the Division Engineer as purely discretionary, and because the report of the Commissioner as to diversions from District No. 48 are rarely called for, we submit that Wyoming should be permitted to install its own measuring devises, or that the same be placed under the control of a Federal agent.

Paragraph 13 of the bill alleges a flagrant disregard of the terms of the decree as to diversions for irrigation of the meadow lands in Colorado, and as to these allegations, defendant makes no comment. As to the allegations of Paragraphs 11 to 15, relating to excessive or unlawful diversions, the allegations are met by an assertion that such diversions do not violate the terms of the decree in the former Wyoming-Colorado suit.

In Paragraph 2 of the second cause of action, complainant alleges that permission to Wyoming to measure the diversions from the Laramie River in District No. 48 to the Poudre River in District No. 3, was denied. Defendant does not attempt to refute this allegation and disposes of same by the comments found on Page 11 of her brief, to the effect that Wyoming would not accomplish anything further than furnish the means of creating disputes between the measurements taken by the agents of Wyoming when compared to the measurements taken by Colorado agents, with no method of adjusting such differences. The possibility of creating such a situation would seem to justify the request of Wyoming that the duty of meas-

uring said diversions be entrusted to an impartial and independent agency.

CONCLUSION

Colorado states, Page 20 of her brief, that if Wyoming's position with reference to the construction of the former decree is correct, that conclusion would practically dispose of the case, admitting that more than 18,000 acre-feet annually have at times been diverted through the Skyline Ditch. It is a legitimate assumption that if Wyoming's position as to the relative rights of the two contending states in the use of the waters of this interstate stream be correct, there would be nothing further for the consideration of the Court, especially if future regulation of diversions be placed under an impartial agency.

The position advanced by defendant in her motion to dismiss the bill of complaint has placed the case before the Court in a manner which will enable it to make a final disposition of the same upon the consideration of the motion. It will be unnecessary to require further evidence than the admissions of defendant, as Wyoming is not seeking an award of damages but desires that defendant Colorado be prevented in the future, from taking from the Laramie River any of that portion of the stream flow which this Honorable Court determined was Wyoming's equitable portion.

There is no failure on the part of Colorado to fully understand the full import of the decree determining the relative rights of Wyoming and Colorado in the use of the waters of the Laramie River, and the purpose of the present suit is to prevent further violations thereof by Colorado, acting through her officials, agents and citizens, by and with the consent of the State of Colorado.

The quotation from the brief of the Attorney General of Colorado in the case of The La Plata River and Cherry Creek Ditch Company v. M. C. Hinderlider, et al., supra, Page 155, states most forcefully and clearly why Wyoming has filed her bill of complaint in the case at bar, and answers the question presented to this Honorable Court in the way Wyoming contends it should be answered:

"THE TWO STATES AND THEIR OFFICIALS WOULD BE BOUND TO OBEY THE DECREE OF THAT COURT."

Complainant respectfully submits that the motion of the defendant is without merit and should be denied. That by reason of the definite admissions in the brief of defendant of the truth of the allegation of plaintiff's bill of complaint to the effect that defendant has through her officials, permitted the taking of water from the Laramie River and its diversion therefrom into the Poudre River in annual quantities in excess of the equitable portion allotted to Colorado under the decree in the former Wyoming-Colorado case, supra, the Court make final disposition of this case upon consideration of defendant's motion. Colorado so states on Page 20 of her brief in support of the motion to dismiss.

RESPECTFULLY SUBMITTED,

.....

JAMES A. GREENWOOD,
Attorney General of the State of Wyoming.

OCTOBER TERM, 1932

No. 15, Original

THE STATE OF WYOMING,
Complainant,
vs.
THE STATE OF COLORADO,
Defendant.

ANSWER OF THE STATE OF COLORADO TO THE AMENDED ORIGINAL BILL OF COMPLAINT

Comes now the State of Colorado, by Clarence L. Ireland as Attorney General of the State, and for answer to the amended original bill of complaint of complainant, the State of Wyoming:

FIRST: It admits the allegations of the First, Second, Third, Fourth, Fifth, Sixth and Seventh numbered paragraphs of said complaint.

SECOND: Answering the "Eighth" numbered paragraph, it denies that the gauging and measuring devices installed by this defendant do not accurately gauge and measure the full amount of water diverted by means of and

through the designated lawful diversions as defined in the said decree of this Honorable Court; and alleges that all of such measuring equipment is standard and adequate for making proper measurements; and defendant is ready and willing to permit the complainant and its accredited officials to check all of such equipment; and the defendant is also ready and willing to make, or cause to be made, any proper improvements in such measuring devices or methods of measurement to the reasonable satisfaction of the plaintiff, and will furnish to the plaintiff a reproduction record of gauge heights and daily diversions and all information necessary to enable plaintiff accurately to check and verify the same.

THIRD: It denies that it has permitted water to be diverted from the Laramie River and/or its tributaries by means of and through the Laramie-Poudre tunnel diversion in excess of 15,500 acre-feet per annum; it denies that during the year 1926, there were diversions through said tunnel of 13,572 acre-feet; it denies that diversions in such quantities were shown by the official records of Colorado. As to the allegation of said "Ninth" numbered paragraph concerning unreported diversions through said tunnel in the amount of over 3,000 acre-feet, defendant alleges that, during the year 1926, the "Skyline Ditch" (the ditch referred to in the former decree of this Court) broke and remained for some time in a state of disrepair, incapable of carrying the water to which the owner of said ditch was entitled, and thereupon, by arrangement between such owner and the owner of the Laramie-Poudre tunnel, the water to which the Skyline Ditch was entitled was carried through and by means of the Laramie-Poudre tunnel, to the extent of approximately 583 acre-feet.

Admits that the records of the Division Engineer certified to by him show a diversion of 5,644 acre-feet through the tunnel, and alleges that the diversion through said tunnel in said year was 5,644 acre-feet and no more, being

5,061 acre-feet on account of the tunnel appropriation and 583 acre-feet on account of the Skyline appropriation.

FOURTH: Answering the "Tenth" numbered paragraph of the complaint, the defendant admits that, as set forth in said decree, the State of Wyoming was found to be entitled to water from the Laramie River for the purpose of irrigating lands in said state in excess of the amount of water to which the State of Colorado was found to be entitled for irrigating lands in Colorado, but for its exact provisions defendant refers to said decree; admits that the State of Wyoming has an interest in the appropriation, diversion and measurement of the waters of the Laramie River and its tributaries in Colorado. Answering the charge that defendant, although requested in writing for permission to install its own standard gauging devices and make its own measurements of diversion of water from said Laramie River and its tributaries in Colorado, denied such request, defendant alleges that the State Engineer of Colorado, the official in general charge of supervision of irrigation in the state, invited the officials of Wyoming to check all measuring equipment installed for making proper measurements, together with all data obtained by Colorado officials in connection with the same, and then offered to make any proper improvements in devices or methods of measurement, as suggested by plaintiff, but said offer was thereupon declined, and it was then demanded in behalf of Wyoming that all such measurements and equipment be placed under the supervision of a representative of the United States Geological Survey, which demand was denied for the reason that the State Engineer could not agree conformably with the duties of his office to surrender the control which the statutes of the state impose upon him; and hereunder the State of Colorado avers that the transmountain diversions from the Laramie River for carriage of water in the Cache la Poudre River vitally affect and concern all existing water rights in said Cache la Poudre River in Colorado.

The defendant is ready and willing now, and for the future, to permit access to all of such measuring devices, and to cooperate with the officials of the plaintiff, to the end of assuring at all times accurate measurements of all transmountain diversions made of the waters of the Laramie River in Colorado. Defendant alleges that all of the devices in use and all of the measurements made in the past are standard, proper and accurate, to the best of defendant's knowledge, information and belief; and defendant further alleges that, for the past four years the State of Wyoming has actually been making its own measurements and consulting the records of measurements made by its own officials and by the Colorado water officials as to the transmountain diversions from the Laramie River in Colorado.

FIFTH: For answer to the "Eleventh" numbered paragraph of said complaint, the defendant disclaims and denies any intent on its part to violate or to disregard the said decree and the terms thereof, or the injunction therein contained against the alleged excessive or otherwise unlawful diversions of water therein referred to; and hereunder alleges that the Attorney General of the State of Colorado and the officials charged with the supervision and control of water diversions in the State of Colorado, in administering and controlling such diversions from the Laramie River, have in good faith considered and believed that the proviso incorporated in the decree of this Court that the same should not prejudice the right of the State of Colorado to continue to exercise the right existing thereby recognized to divert and take from such stream and its tributaries certain quanitites of water under certain appropriations theretofore made, did not operate as a limitation upon the enjoyment of such appropriations perfected in the state prior to the entry of the said decree to the extent of their beneficial use as enjoyed prior to the entry of the said decree.

SIXTH: It admits that there was diverted through and by means of the Skyline Ditch, as alleged in the "Twelfth"

numbered paragraph of the complaint, 22,150 acre-feet of water in the year 1927, and 19,397 acre-feet of water in the year 1928. It denies that 24,363 acre-feet of water was diverted in the year 1929, and alleges that in said year 23,686 acre-feet and no more was so diverted.

In connection with this admission, the defendant alleges that, during none of the said years was there a total diversion from the Laramie River and its tributaries in Colorado in excess of the total of 15,500 acre-feet in connection with the Laramie-Poudre tunnel appropriation, and 18,000 acre-feet in respect of the Skyline Ditch appropriation, and 4,250 acre-feet in virtue of and through the meadowland appropriation in that state, together with the relatively small amount of water appropriated from the headwaters of Deadman Creek by and through what is designated as the Wilson Supply Ditch, save only in the year 1929, in which year as appears by the records 23,686 acre-feet was diverted by the Skyline Ditch, 8,916 acre-feet by and through the Tunnel appropriation, 600 acre-feet by means of the Columbine Ditch, and 1,140 acre-feet by means of Bob Creek Ditch, in addition to the diversions by the "meadow" appropriators and by the Wilson Supply Ditch. For the years 1927 and 1928 a quantity of water substantially less than 37,750 acre-feet, in addition to the water appropriated by means of the Wilson Supply Ditch was so diverted.

Defendant alleges that, according to its understanding of the force and effect of the decree of this Court, the plaintiff is without just or legal ground for complaint with respect to such diversions, so long as the total of diversions permitted in Colorado is not exceeded; and that such permitted total of diversions was awarded or recognized in Colorado as a unit, and that such total quantity is and of right should be administered and allowed to be diverted by the several appropriators thereof as their several rights *inter se* appear, and that this Court has not undertaken to allocate fixed quantities severally to the individual consum-

ers, and all matters in controversy between said several consumers are for determination in the courts of the defendant unprejudiced by the determination of this court other than its limitation to a permitted maximum of the total of such diversions.

SEVENTH: Answering the "Thirteenth" numbered paragraph of the complaint, it denies that during any of the years 1926, 1927, 1928 and 1929, there was diverted away from and taken in the State of Colorado by its officials, or agents, or representatives, or other citizens, or residents, or corporations, from the Laramie River and its tributaries in Colorado, amounts of water for irrigation of acreage in excess of the amounts by said decree authorized for the purpose of irrigating 4,250 acres of meadow lands in the State of Colorado; denies that there was used or consumed in the State of Colorado for irrigating meadow lands any amount of water in excess of 4,250 acre-feet; denies that there was taken from the Laramie River for irrigating meadow lands in the Laramie River valley in Colorado in any of said years any amount of water such that the supply available at the state line between Wyoming and Colorado was thereby reduced in excess of 4,250 acre-feet.

Defendant denies that during any of said years there was irrigated more than 4,250 acres of natural hay meadows.

With respect to the charges in said "Thirteenth" paragraph concerning excessive diversions during the four years specified, defendant states that irrigation as practiced on these mountain "meadow lands" is by the so-called "flooding" system, in which the water is turned out on the meadow lands and permitted thereafter to run through the irrigation season of from 50 to 60 days. That the valley of the Laramie River, in which this method of irrigation is practiced, is in most places not in excess of one-half mile in width, and the land is underlaid with gravel, and, upon applying the water, the same returns almost immediately to the several streams, either by surface flow or through said

gravel, and such diversions do not substantially diminish the flow, and the water is re-diverted several times over before it leaves the state. The method of use and application of water as practiced in Colorado is identical with that followed in the mountain valleys of the Laramie and Little Laramie in Wyoming, and in both states it is and at all times has been the common practice in irrigation of native hay meadows to divert large quantities and to keep the water flowing and circulating without cessation across the meadows and back to the stream throughout the growing season.

That it would be wholly impracticable satisfactorily to operate these "meadow" ranches if the several Colorado appropriators were limited to a total of 4,250 acre-feet as measured at the headgates of the respective irrigation ditches; that in the former suit of the State of Wyoming against the State of Colorado, no complaint was made by plaintiff as to the method of use practiced by the several appropriators owning the so-called "meadow" appropriations, nor was such method in any wise attacked or questioned in the testimony adduced or arguments presented in that case. Such method of irrigation had been practiced since the time of original settlement of said ranches. That it was shown by the said testimony that the actual loss, or consumption of the flow of the Laramie River each year resulting from this system of irrigation was one acre-foot per acre, although it likewise was disclosed in such evidence that many times that amount was diverted and returned to the river during the process of meadow irrigation, and that the diversion of the additional amounts of water caused no other loss to the river supply. This same practice and method has been followed without change since the date of the entry of decree in said former case. Defendant alleges that no more acreage of meadow lands is being irrigated than was irrigated in Colorado previous to and at the time of the former trial, and that the same amount of water is being consumed annually in the irriga-

tion of said meadows as was consumed previous to said trial.

Defendant concedes that under the decree rendered in such former case, these mountain appropriators should be limited to the ditches constructed and in operation prior to the entry of the former decree; and that the number of acres of hay meadows irrigated should not be exceeded, and is willing to assure to plaintiff that the same shall not be exceeded, and to afford all cooperation necessary to that end, or otherwise to abide the decree of this court in the matter of affording such adequate assurance to the plaintiff, but avers that the former decree of this court is not susceptible to the construction that the meadow appropriations are subjected to a limitation of 4,250 acre-feet of diversions measured at the headgates of the respective ditches.

EIGHTH: For answer to the charges contained in the "Fourteenth" paragraph of the complaint, the defendant states:

I.

As to the *Bob Creek Ditch*, the location, description and capacity thereof are admitted as stated, and likewise as to the "small ditch" mentioned in the *second* subdivision of said paragraph "Fourteen," and the diversions as stated are likewise admitted, save that, according to the report in the office of the State Engineer, the quantity diverted in the year 1929 was 1140 acre-feet and not 1153 acre-feet as stated.

With respect to the charge of diversions by means of the Bob Creek Ditch and Bob Creek Ditch Extension occurring on the 17th of June, 1932, defendant states that, subsequent to the decision of this Court rendered on May 31, 1932, the State Engineer of the State of Colorado was not immediately informed as to the scope and effect of said decision, and that upon said 17th day of June, 1932, the matter of said diversions was for the first time definitely called to

his attention, and he was then advised by the Attorney General of the said State that he should not permit further diversions of water by means of said ditches until the further order of the court in the premises, and said diversions were thereupon ordered stopped, and from and after the 18th of June, 1932, they have ceased.

With respect to the *Columbine Ditch*, the existence, location, description and dimensions as stated in *subdivision 3* of paragraph "Fourteenth" are admitted, and likewise the diversions, as stated, by means of the said ditch in the years 1922 to 1929, inclusive, are admitted, save only the diversion as stated in the year 1922, in which year, according to the records of the office of the State Engineer, no water was diverted instead of 181 acre-feet as stated.

As to the charge concerning diversion practiced by means of this ditch on the 17th of June, 1932, said diversion ceased on the 18th of June, 1932, under order of the State Engineer, which order was obeyed under the circumstances hereinabove stated concerning the diversions by the Bob Creek Ditch and its extension.

And further with respect to said Bob Creek Ditch, said Bob Creek Ditch Extension, and Columbine Ditch, the defendant alleges that said ditches are now the properties of the Mountain and Plains Irrigation Company. The Bob Creek Ditch diverts its supply of water from Bob Creek, also known as Nunn Creek and certain other unnamed tributaries of said Bob or Nunn Creek, which is a tributary of Laramie River. Work on this ditch was commenced by survey September 24, 1897, and on October 17, 1898, a survey was commenced for an extension of the original project of Bob Creek Ditch. This extension discharges its water into the head of the original Bob Creek Ditch across the channel of Bob Creek. The owner claims that the work of the construction of the original project was completed in the year 1902. The extension ditch above mentioned was completed in the year 1920. The waters collected in and diverted by Bob Creek Ditch and Bob Creek Extension are

used for the irrigation of agricultural lands in the Counties of Larimer and Weld. Such waters are delivered into the main channel of the Cache la Poudre River and stored by means of exchange in a reservoir known as Gilmore Reservoir or in a reservoir known as Portner Reservoir. Bob Creek Ditch and the extension were conveyed by the Larimer and Weld Reservoir Company, the original owner thereof, on October 29, 1919, and by mesne conveyance became vested in the Mountain and Plains Irrigation Company on June 29, 1920.

The Bob Creek or Nunn Creek diversions occur at an altitude of approximately 9,975 feet, and the run-off period is from about the 16th of May until the 17th of July, the peak run usually occurring about June 1st. The maximum capacity of the ditch is approximately 55 cubic feet of water per second, but due to the elevation and the limited area of run-off, a comparatively small amount of water is capable of diversion, the maximum actual diversion to date having been the amount of 1174 acre-feet, diverted in the year 1923.

II.

With respect to the *Columbine Ditch:* This diverts its supply of water from Deadman Creek and Columbine Creek, and is now the property of the Mountain and Plains Irrigation Company. The water diverted and carried by means of this ditch is discharged into the North Fork of the Cache la Poudre. Said Deadman Creek and Columbine Creek are tributaries of the Laramie River.

The work commenced on said ditch by survey begun September 7, 1897.

Columbine Ditch Extension, also the property of the Mountain and Plains Irrigation Company, diverts its supply of water from a certain ravine located on the east line of Section 15, Township 10 North, Range 75 West of the 6th P. M., in Larimer County, Colorado, the headgate being located about 1120 feet north of the southeast corner of said

Section 15. The general course of the ditch is in a southerly direction, discharging its water into the North Fork of the Cache la Poudre River. Work was commenced on this extension by survey September 17, 1898.

By mesne conveyances these ditches became the property of the Divide Canal and Reservoir Company, the Columbine Ditch becoming part of the so-called "Sand Creek Ditch System."

The original project was to divert water from Deadman Creek into Sand Creek, and from Sand Creek by another ditch into Sheep Creek, thence through Sheep Creek into the North Fork of the Cache la Poudre River, whence it would find its way to the main stream of the Cache la Poudre. However, for the purposes of the Divide Canal and Reservoir Company it was found that the original project was not feasible, and by deed dated October 4, 1919, said company conveyed by quitclaim deed to Roy A. Portner the Columbine Ditch, and thereafter Portner, on October 27, 1920, conveyed the ditch to the Mountain and Plains Irrigation Company.

This ditch is located at an altitude of approximately 9,500 feet, and the run-off period is limited to approximately from May 16th to July 17th, the peak of flow being reached about the 1st of June.

The facts with respect to utilization of the water diverted and carried by means of this ditch are identical with those stated concerning the Bob Creek Ditch.

Since the acquirement of the Columbine Ditch and Columbine Ditch Extension by the Mountain and Plains Irrigation Company, they have been maintained and operated by said company during the irrigation season and water diverted in each season when available for such diversion, and by reason of the diversions and applications to beneficial use of water obtained from said Bob Creek and Columbine systems, vested rights were claimed to appropriations for the same as of the dates herein stated of com-

mencement of work by the said Mountain and Plains Irrigation Company and the diversions made as charged in the complaint were made under such claim of right.

III.

Answering the *fourth* subsection of said paragraph "Fourteenth," concerning the "Lost Lake System," defendant admits the existence, location, capacity and use of the several lakes referred to, and states that the construction of Lost Lake commenced in the year 1890 and resulted in the storage of water and diversion through Chambers Lake by the Water Supply & Storage Company in the spring of 1891. The reservoir was constructed by placing a dam across an unnamed gulch tributary to the Laramie River, and impounding water to a depth of 15 feet. The outlet from this reservoir is into Chambers Lake and thence down the Poudre, and storage at the depth mentioned gives an estimated capacity of 12,541,030 cubic feet, or approximately 288 acre-feet.

Laramie Lake was constructed at the same time as Lost Lake, and water was stored and used for irrigation in the spring of 1891. The dam was 11 feet in height, with an estimated capacity of 14,817,744 cubic feet, or approximately 340 acre-feet. The outlet from this lake is into Lost Lake and the water is taken through Lost Lake and into Chambers Lake, and thence down the Cache la Poudre.

The Lily Lakes construction was commenced on June 1, 1912, and water was stored and used for irrigation purposes in the spring of 1913. There is a storage depth in this reservoir of 5 feet and an estimated capacity of 7,747,189 cubic feet, or approximately 178 acre-feet. The outlet to this reservoir is through Laramie and Lost Lakes into Chambers Lake.

These lakes are small and their filling is uncertain. The "Lost Lake System" is not connected with the "Skyline" Ditch. They, however, have the same outlet into Chambers

Lake, and are operated under the same general plan, and the lake system supplements the other diversion, and both togther make up what is termed the "Laramie River Diversion of the Water Supply & Storage Company." Defendant states that, in accordance with its understanding of the force and effect of the former decree of this Court, it should not be construed so as to prohibit the continued operation of the "Lost Lake System" in connection with the permitted diversion of the Water Supply & Storage Company and as an adjunct to its "Skyline Ditch" diversion, so long as the permitted amount of 18,000 acre-feet is not exceeded.

With respect to the charge in the *sixth* subsection of said paragraph "Fourteenth," concerning the storage of water in Lost Lake, Laramie Lake and Lily Lake, on the 17th day of June, 1932, defendant states, at a time when the permitted diversion by the Water Supply & Storage Company, through its Skyline Ditch, in the amount of 18,000 acre-feet had not been exceeded, the State Engineer of the State of Colorado, by order, directed and required the cutting of the dykes of the said lakes so that the quantity of water therein impounded became available to the appropriators of water of the Laramie River in the State of Wyoming, and that such cutting of dykes occurred on or about the 21st of August, 1932.

IV.

Defendant answering those portions of the "Fourteenth" paragraph of the amended bill of complaint pertaining to *The Wilson Supply Ditch*, and particularly the first or unnumbered paragraph thereof, and subdivisions 5, 6, 7, and 8, and all of the "Fifteenth" paragraph says:

That The Wilson Supply Ditch, and the Deadman or Deadman Feeder Ditch, the Deadman Ditch, the Divide Ditch, and Sand Creek Ditch, and the alleged Deadman Extension Ditch, mentioned and described in said amended complaint, are all one and the same ditch, and are the same ditch mentioned and described in the evidence in the former

trial in this matter, and in the modified decree therefor, entered by this court October 9, 1922, and set forth in substance in the *seventh paragraph* of the amended complaint, in all of which said ditch is named and described as The Wilson Supply Ditch.

Defendant denies that there is any separate ditch, or portion of ditch, known as the "Deadman Extension Ditch," and states that the portion of ditch mentioned and described in said *subsection 6* of the "Fourteenth" paragraph is merely a section of the Deadman Feeder Ditch, located near the central part of said ditch, and the same is not an extension or an enlargement thereof, but on the contrary the same now is, and at the time of the original construction of said ditch was, a portion thereof; that the "Deadman Feeder Ditch" of the Wilson Supply Ditch heads or connects with Sand Creek near the head waters thereof, at a point in the northwest quarter of section 15, township 10 north, range 75 west, and extends thence in a general southerly direction with many winding courses following the contour of the mountain side through sections 15, 14, 22, 23 and 26, township and range aforesaid, and terminates at a point about 950 feet north of the quarter corner of said section 26, and the entire length is about 5 miles. That the whole thereof was originally constructed as one ditch, and appropriations of water were made thereby and therefor, as of the date of June 15, 1899, and ever since said entire line of ditch has been maintained and used to take and collect and divert water along the line thereof, and discharge the same into Sand Creek, which is used as a part of The Wilson Supply Ditch; that from the said point of discharge said water is carried in Sand Creek to a point near the south line of section 22, township 11 north, range 75 west, at which point all the waters collected by the Deadman Ditch, together with the waters appropriated from Sand Creek, are diverted from Sand Creek through and across the divide and into Sheep Creek, by an open ditch and tunnel, sometimes called "Divide Ditch" and some-

times "Sand Creek Ditch," but the same, however called, is a portion of The Wilson Supply Ditch.

That the upper or southerly portion of the Deadman Feeder Ditch as originally constructed and since maintained was 3 feet wide on the bottom, 7 feet at highwater line, and carried water 3 feet deep and had a capacity of 50 second-feet or more, for the first 3 miles and then for a short distance it was 4 feet wide on bottom, and for the last 1.3 miles before discharging into Sand Creek it was 8 feet on bottom and 13 feet wide at high water line, and carried water 3 feet in depth, with a grade of 5 feet or more per mile, and a carrying capacity of approximately 130 second-feet, as stated in said amended bill of complaint.

That said The Wilson Supply Ditch, where the same connects Sand Creek with Sheep Creek, was and is constructed 10 feet wide on the bottom, 16 feet wide on top, and carried water 5 feet in depth, with a grade of 10 feet per mile, and a capacity of approximately 300 second-feet. That said The Wilson Supply Ditch was all constructed as one enterprise, and of the foregoing dimensions and capacity, and work of construction thereof was begun in June, 1899, and an appropriation of water therefor was made as of date of June 15, 1899, in the amount of 288 second-feet from the waters of Sand Creek and from Deadman Creek and tributaries jointly, and said appropriations of water are the same shown in the evidence in the former trial and mentioned and described in the modified decree of this court entered October 9, 1922. That in the year 1904, pursuant to the laws of Colorado, a proceeding was duly commenced in the district court of Larimer County, Colorado, to adjudicate appropriations of water in water district No. 48 in State of Colorado, which includes Laramie River, and said proceeding was case 1885 in said court, entitled "In the matter of the adjudication of priorities of right to water in water district No. 48, division No. 1 of State of Colorado."

That the owner of The Wilson Supply Ditch appeared in

said proceeding and filed its statement of claim, and submitted proof concerning the same, and on October 11, 1906, said court made and entered a decree of and concerning said The Wilson Supply Ditch and its appropriations of water, therein described as "The Sand Creek Ditch System," which decree awarded said ditch priority No. 38, in said water district, as of the date June 15, A. D. 1899, in the amount of 288 second-feet, from the waters of said Deadman Creek and tributaries, and Sand Creek, in the State of Colorado, which said appropriations of water were made long prior to the year 1902, and are the same appropriations of water mentioned and confirmed to said The Wilson Supply Ditch by the modified decree of this court in the former proceedings on October 9, 1922, and not otherwise.

That the water available under said appropriation can be procured for only a short period of time during each year, and then only in variable amounts, from day to day, and by reason of the cold weather the daily run often varies as much as 50%, on account of the thawing and freezing weather at said altitude. That the water supply available varies greatly from year to year in accordance with the quantity of snow which falls on the watersheds of said creek; that occasionally for a few hours in a day the full amount of the appropriation can be procured for a few days in the season, often only 10 to 25 second-feet of water can be procured to supply said appropriation; that water can be procured only from about the middle of May to about the first of July in any one year varying according to the season.

That during each year since the initiation of said appropriation, the owner of said ditch has diverted such water as was available and defendant states on information and belief that of the water annually diverted, about 60% thereof is obtained from Deadman Feeder of The Wilson Supply Ditch, and the remaining part from the waters of Sand

Creek, which proportions also vary from time to time, according to the amount of water in said streams.

Admits that during the year 1929 and 1930, the owner of said The Wilson Supply Ditch did some work of surveying and making repairs on that portion of said ditch mentioned in the *sixth subdivision* of paragraph "Fourteen" of the amended complaint, and said work of cleaning and repairing was done upon about a mile of the central portion of the Deadman Feeder Ditch. On information and belief defendant states that said portion of said ditch was so constructed on the mountain side that it was difficult to maintain the lower embankment thereof, and keep it from caving or breaking; that in order to strengthen the bank and make it more secure, it was necessary in getting material therefor, to take earth from the inside of said ditch, and in so doing, it widened the ditch at said point; that said work of repair was done solely for the purpose of strengthening the embankment, and not for the purpose of widening the ditch to carry more water; that no more water was taken or carried in said portion of said ditch so repaired than theretofore; that such work of repair is frequently necessary on any irrigation ditch, and particularly a ditch built on the mountain side; that since said repair work no greater quantity of water has been taken through said portion of said ditch than before, and there is no intention to take or divert more water by reason of the said repair work.

Defendant denies that the owner of said The Wilson Supply Ditch has taken or diverted any water from the tributaries of the Laramie River or Sand Creek contrary to, or in violation or disregard of, the terms of said modified decree authorizing the diversions of water by said The Wilson Supply Ditch.

Defendant admits the allegations concerning that portion of The Wilson Supply Ditch and its appropriations of water contained in *subsection 5* of the "Fourteenth" para-

graph of the bill, save that it states that the head of said ditch or point of connection with Sand Creek is located in the northwest quarter of section 15 instead of southeast quarter thereof and avers that the grade of said ditch is more than 5 feet per mile.

Answering the matters stated in subsections 6, 7 and 8 of said "fourteenth" paragraph of the bill, defendant denies that there is any portion of The Wilson Supply Ditch known as "Deadman Extension Ditch," and denies that there is or has been any extension or addition made to said ditch since the original construction thereof, as hereinbefore stated.

Defendant admits that the upper portion of the Deadman Feeder Ditch for the first 3 miles was 3 feet wide on the bottom, 7 feet wide at high water line, and carried water 3 feet in depth, and 5 feet or more in fall, and the capacity of 48 second-feet or more, and that for the lower 1.3 miles thereof the dimensions and capacity are as stated in the *fifth subdivision* of said paragraph.

NINTH: With respect to the matters set forth in the "Fifteenth" paragraph of the Amended Complaint, defendant admits that the modified decree heretofore entered by this court on October 9, 1922, recognized the appropriations of The Wilson Supply Ditch and confirmed to the owner thereof the right to continue to divert from Deadman Creek and its tributaries the amount of water appropriated thereby prior to the year 1902, being the existing appropriations of said ditch, and defendant avers that said existing appropriations were made as of the date June 15, 1899, both from Deadman and Sand Creek, and said appropriations had been used and enjoyed until the rendition of said modified decree and have since been so used and enjoyed. Denies that the owner of said The Wilson Supply Ditch had not made an appropriation of water therefor prior to the year 1902, and, on the contrary, avers that the appropriations of water for

said ditch were made and perfected as of June 15, 1899, the date when said ditch was constructed, and not otherwise.

Defendant admits that in June, 1932, the owner of The Wilson Supply Ditch diverted water through Deadman Feeder Ditch *and also from* Sand Creek, but denies that said diversion was unlawful, injurious to plaintiff, or contrary to the terms and provisions of said modified decree, or that the same was in violation of the rights of any other appropriator from said Sand Creek.

Defendant admits that the map marked exhibit "A" and attached to the amended complaint shows, for illustrative purposes, the location of The Wilson Supply Ditch and the several portions thereof, under the various names used in relation thereto, and avers that if a line were drawn from the point of the lower or Deadman Ditch (arrow) to the upper or Divide Ditch (arrow) the same would show the line of Sand Creek and connection between two portions of The Wilson Supply Ditch or said Sand Creek Ditch system.

TENTH: Admits the allegations of the "Sixteenth" paragraph of the Amended Complaint concerning the pendency in the district court of Larimer County, Colorado, of applications filed on behalf of the Water Supply & Storage Company, as owner of Laramie Lake, Lost Lake and Lily Lake, for the purpose of having decreed to said owner the authority to divert and store water for irrigation purposes in said reservoirs.

ELEVENTH: Defendant likewise admits the allegations of the "Seventeenth" paragraph of the Amended Complaint concerning the pendency in the district court of Larimer County, Colorado, of applications on behalf of Mountain and Plains Irrigation Company for adjudication of rights of Bob Creek Ditch, sometimes known as Nunn Creek Ditch, and the facts in said paragraph stated concerning the allegations of the petition of said The Mountain and Plains Irrigation Company.

With respect to the charges of the "Sixteenth" and

"Seventeenth" paragraphs of the Amended Complaint, concerning the pendency of such adjudication proceedings in the district court of Larimer County, defendant states its understanding of the force and effect of the former decree of this Court to be that such district court should properly proceed in the matter of such adjudication of rights of the respective claimants of water from the Laramie River in Colorado without interference, and that this Court is not concerned with such adjudication or with diversions practiced under rights therein to be adjudicated so long as the recognized and permitted amounts of diversions are not exceeded.

TWELFTH: Defendant admits that the topographical map of the watershed of the Laramie River and its tributaries in Colorado, attached to the Amended Complaint and marked "Exhibit A," shows for illustrative purposes the location of the diversions described in the Amended Complaint, but denies that it is a complete or accurate showing of such locations.

THIRTEENTH: Defendant admits the facts of the conferences as alleged in paragraph "Nineteenth" of the Amended Complaint, and that thereat assertion was made on behalf of Wyoming that diversions of water made in Colorado were excessive and unlawful, and that such assertion was denied by and on behalf of Colorado.

Defendant admits that the officials of Colorado, replying in writing to the protest of the State of Wyoming, stated that they were at all times willing and anxious to abide by the terms of the decree of this Honorable Court, and defendant states that it is now willing to abide such decree; and states that the greater part of the controversy then existing between the parties was due to a difference of opinion as to the force and effect of the said decree, the defendant then contending that the said decree was not susceptible to the construction that thereby the vested appropriations of Colorado appropriators other than the owner

of the tunnel appropriation were curtailed, limited, or divested by reason of the proviso of the said decree.

FOURTEENTH: For answer to the "Twentieth" paragraph of the Amended Complaint, the defendant denies the allegations thereof and disavows any intention or purpose to increase the diversion of water from the Laramie River and its tributaries for irrigation of lands in Colorado, and states that its purpose is strictly to abide by and obey the decree of this Court entered in the former proceeding and also the decree herein to be rendered.

Defendant, however, states that when the water is available it will permit the diversion through the Laramie-Poudre tunnel, by its feeders, ditches and headgates leading thereunto from the Laramie River and its tributaries in Colorado, of an amount of water up to the maximum permitted by said decree; and denies that thereby the amount of water determined by said decree as being available to Wyoming as against said diversion by citizens of Colorado will be reduced or consumed, or that Wyoming thereby will be deprived of protection under said decree to the use of water to which it was determined by said decree to be entitled. And defendant further states that, with respect to the so-called "meadow" appropriations, unless and until otherwise directed by order of this Court, it will permit their utilization in manner as they have been wont to be used and enjoyed, to-wit, by the method of "flooding" as herein fully described.

And further defendant admits that, until otherwise directed, it will continue to permit the diversion by the owner of The Wilson Supply Ditch of the quantities of water available for diversion by means of such ditch, said use not having been changed nor the diversion increased since the date of the decree of this Court in the former suit, and the appropriation therefor having vested prior to the year 1902.

Defendant further states that, when water is available, it

will permit the diversion through the "Skyline" Ditch from the Laramie River of an amount of water up to the maximum permitted by said decree.

With respect to the allegations of the Amended Complaint concerning diversions by Columbine and Bob Creek Ditches and by means of the so-called "Lost Lake System," defendant states its purpose to be to prevent the same until the further order of the Court in the premises, being thereunto apprised by decision of this Court rendered May 31, 1932. The defendant, however, states its understanding of the force and effect of the former decree to be that the State of Colorado is limited to 37,750 acre-feet plus the amount to be determined herein to be available to the Wilson Supply Ditch, and that the decree of this Court did not undertake to make a determination of the respective rights of the several appropriators in Colorado in such permitted maximum of total diversion, and that the division of such total award may of right be made by the district court of Larimer County, Colorado, or other court of appropriate jurisdiction in the said state.

The defendant disavows and disclaims any intent or purpose on its part in connection with any of the matters set forth in the Amended Complaint to disregard or violate the decree of this Court as heretofore rendered, or to disobey in any respect the decree to be herein rendered.

For Answer to the Second Cause of Action:

FIRST: Defendant refers to the admissions, denials and allegations set forth in its defense to the First Cause of Action, and makes all the said matters and things set forth in said defense part of this its defense to the Second Cause of Action, to the same effect as though herein specifically set forth.

SECOND: It admits the request set forth in the "Second" paragraph of said Second Cause of Action and the denial thereof, and that the State of Wyoming has an interest in said water of the Laramie River watershed, by virtue of the decree of this Court; denies that Wyoming is compelled to rely on the measurements made by the State of Colorado, and, on the contrary, states that Wyoming is permitted free access to make its own measurements in the State of Colorado, and to inspect and check upon the measurements and measuring devices of the State of Colorado along its streams and tributaries from the Laramie River, and has for several years last past been doing so, and Colorado is willing that it shall continue to do so.

THIRD: It denies the allegations of the "Third" numbered paragraph in said Second Cause of Action in respect of permitting the State of Wyoming to install structures in the Laramie River and its tributaries in the State of Colorado or in any trans-mountain ditches, lakes or reservoirs, by means of which water is being or may be diverted in the State of Colorado from said water-courses, lakes and reservoirs; alleges that there is no necessity for such installation; denies that said installation of gauges, measuring devices or structures of any kind, or measuring of such waters, should be carried on by the federal government at the expense of either of said states.

WHEREFORE, the State of Colorado, having fully answered the Amended Bill of Complaint, and having made

full disclosures with respect to the several acts charged against it, and also having set forth the several rights of its citizens and appropriators of the waters of the Laramie River in Colorado, affirms its desire to abide by the determination of the Court and in all things to conform to its decree as to the matters presented in the Amended Bill of Complaint. Defendant submits, however, that beyond quieting the rights of the State of Wyoming and the State of Colorado and their respective representatives, citizens, and residents, in the waters of the Laramie River in Colorado conformable to the issues herein, no further action by this Court is required.

THE STATE OF COLORADO,

In the
Supreme Court of the United States

October Term, 1935

No. 10, Original

In Equity

THE STATE OF WYOMING, *Complainant,*
vs.
THE STATE OF COLORADO, *Defendant.*

COMPLAINANT'S BRIEF

STATEMENT

The State of Wyoming, in her original Bill (Rec. pp. 4-20), complained that her right to the use of the water of the Laramie River, as determined in a decree of the United States Supreme Court dated June 5th, 1922, (Reported Vol. 259 U. S., p. 419) as modified by decree of October 9th, 1922, (Reported Vol. 260 U. S., p. 1) involving the relative rights to the use of the water of the Laramie River in the States of Wyoming and Colorado, is being disregarded in that Colorado is diverting and taking from the Laramie River and tributaries, amounts of water in excess of the quantity granted her under said decree, as modified, for the Colorado appropriations recognized by this Honorable Court in said decree as entitled to the use of said water and, also, for other and additional diversions not recognized in said decree and claimed by Wyoming to be unlawful.

To the original Bill of Complaint, Defendant, State of Colorado, interposed a motion to dismiss the Bill (Rec. pp. 25-28) on the ground that the Bill was insufficient to justify the granting of equitable relief, contending that the only question presented to engage the attention of this Honor-

able Court was a law question that should be determined at the outset and before the State of Colorado be required to answer. This Honorable Court overruled the Defendant's motion to dismiss, stating that the chief object of the Bill appeared to be the construction of the decree in the earlier suit; and the Court, in disposing of the motion to dismiss, stated in its opinion (286 U. S. 494, 506, 507; 76 L. Ed. 1245, 1251):

> "We are of opinion that the record, opinion and decree in the prior suit, here reviewed at length, show very plainly that the decree must be taken as determining the relative rights of the two States, including their respective citizens, to divert and use the waters of the Laramie and its tributaries. These rights were put in issue by the pleadings, displayed in the evidence, and considered and resolved in the opinion. Not only so, but the question of priority in time and right as between the appropriations in Colorado and those in Wyoming was directly presented by the pleadings and evidence and distinctly dealt with and resolved in the opinion."

Thereby settling the question of the construction of the decree in the former case, leaving for determination the question: Has the State of Colorado violated the decree?

Leave so to do having been granted, Wyoming then filed an Amended Bill of Complaint (Rec. pp. 32-50) and all further reference in Complainant's brief are to the Amended Bill.

First Cause of Action

Wyoming's Bill in Equity (Rec. p. 32) states that, by said former decree, certain Colorado appropriations were recognized as being entitled to divert from the Laramie River and tributaries, stated quantities of water, viz:

1. The Skyline Ditch appropriation of 18,000 acre feet aanually.

2. The Colorado Meadow Land Ditch appropriation of 4,250 acre feet annually.

3. The relatively small amount of water appropriated prior to 1902 through the Wilson Supply Ditch from the headwaters of Deadman Creek, a Colorado tributary of the Laramie River.

4. The Laramie-Poudre Tunnel appropriation of 15,500 acre feet annually.

That the total, authorized, annual Colorado appropriations from the Laramie River and tributaries to be diverted through and by means of the above designated ditches are 37,750 acre feet of water, exclusive of the Wilson Supply Ditch appropriation from Deadman Creek, a tributary of the Laramie River; that upon the basis of annual, available water supply for the use of appropriators in both states, limiting Colorado appropriations as aforesaid, there should remain for Wyoming appropriators, 272,500 acre feet of water; that the excessive and unlawful diversions of water by the State of Colorado have prevented, and are preventing the State of Wyoming from obtaining the amount of water which the decree in said former case decided would be available as her equitable portion thereof and as reasonably required for Wyoming appropriations.

The specific allegations of Wyoming's Bill relating to excess use of water within the State of Colorado are:

1. That the State of Colorado permitted, during the year 1926, a diversion of water from the Laramie River through and by means of the Laramie-Poudre Tunnel appropriation in excess of the authorized quantity of 15,500 acre feet per annum. (§ 9th, Rec. pp. 35, 36)

2. That the State of Colorado permitted, during the years from 1927 to 1929, inclusive, diversions of water from the Laramie River and tributaries through and by means of the Skyline Ditch in excess of 18,000 acre feet per annum. (§ 12th, Rec. p. 37)

3. That the State of Colorado permitted, during each year from 1926 to 1929, inclusive, diversions of water from the Laramie River and tributaries in excess of 4,250 acre feet per annum for the irrigation of 4,250 acres of Colorado meadow lands. (§ 13th, Rec. p. 37)

In addition to the allegations of excess diversions of water in Colorado through the above recognized means of diversion, the State of Wyoming alleges:

1. That the State of Colorado permitted, during each of the years from 1922 to 1929, inclusive, diversions of stated quantities of water from the tributaries of the Laramie

River to the Cache la Poudre River by a ditch designated as the "Bob Creek Ditch". (Bill, § 14th, subds. 1, 2; Rec. pp. 38, 39)

2. That the State of Colorado permitted, during each of the years from 1922 to 1929, inclusive, diversions of stated quantities of water from the tributaries of the Laramie River to the Cache la Poudre River by a ditch designated as the "Columbine Ditch". (Bill, § 14th, subd. 3; Rec. pp. 39, 40)

3. That the State of Colorado permitted, during the year 1926, the diversion of 448 acre feet of water from the watershed of the Laramie River to the Cache la Poudre River by means of the Lost Lake System of reservoirs. (Bill, § 14th, subd. 4; Rec. pp. 40, 41)

4. That prior to 1902, no water had been appropriated from the headwaters of Deadman Creek through the Wilson Supply Ditch. (Bill, § 15th; Rec. pp. 43, 44)

(a) That the Wilson Supply Ditch has been continually enlarged in capacity for the purpose of increasing the quantities of water that may be, and are thereby annually diverted from the Laramie River watershed. (Bill, § 14th, subd. 8; Rec. pp. 42, 43)

(b) That there was not, at the time of the filing of Complainant's Amended Bill in Equity, an existing lawful appropriation of water from Deadman Creek through said Wilson Supply Ditch. (Bill, § 15th; Rec. p. 43)

(c) That on June 20th, 1932, the State of Colorado was permitting the diversion through the Divide Ditch from Sand Creek to Sheep Creek, of 43.65 cubic feet of water per second of time. (Bill, § 15th; Rec. p. 44)

(d) That such diversion included water coming from Deadman Creek and tributaries into Sand Creek; also, all Sand Creek water above the diversion gate on Sand Creek. (Bill, § 15th; Rec. p. 44)

(e) That such diversion prevented the water of Sand Creek from continuing on down the channel of said stream to and for the use of appropriators from said stream in Wyoming whose appropriations are earlier and, therefore, prior in time to the Colorado appropriations thus diverting and taking said Sand Creek water. (Bill, § 15th; Rec. p. 44)

5. That there are proceedings pending in the courts of Colorado for the purpose of adjudicating the right to use said Lost Lake Reservoir System to divert and store the waters of the tributaries of the Laramie River. (Bill, § 16th; Rec. pp. 44, 45)

6. That there are proceedings pending in the courts of Colorado for the purpose of adjudicating with priority the right of the Bob Creek Ditch to divert from the Laramie River Basin, water for irrigation in the State of Colorado. (Bill, § 17th; Rec. p. 45)

7. That to permit the State of Colorado to continue such diversions of water from the Laramie River and tributaries in disregard of the rights of the State of Wyoming and in violation of the terms of said former decree, will result in finally consuming all of the water of the Laramie River which was allocated to the State of Wyoming in said former decree. (Bill, § 20th; Rec. p. 46)

8. That the State of Wyoming made efforts to obtain the cooperation of the State of Colorado in the installation and operation of gauging stations for the purpose of determining the volume of water diverted in the State of Colorado from the Laramie River and tributaries and, also, sought permission from the State of Colorado to install gauging and measuring devices at her own expense to determine the quantities of water diverted from the Laramie River; that such requests were refused and denied; that prior to the commencement of this suit, the State of Wyoming made written protest to Colorado against said excessive and unlawful diversions. (Bill, § 19th; Rec. p. 46)

Second Cause of Action

That the State of Wyoming made request on March 8th, 1928, in writing, of the State of Colorado for permission to install measuring devices to inventory the volume of water of the Laramie River and tributaries in Colorado; that this request was refused in writing. (Bill, § 2nd; Rec. p. 48)

That because of the refusal to cooperate with Wyoming in such inventory or to consent that the same be made by Wyoming, an order of this Honorable Court should be entered authorizing such measurement and inventory by Wyoming or that such measurement should be made by the Federal Government. (Bill, § 3rd; Rec. pp. 48, 49)

To Complainant's Bill, the State of Colorado answered (Rec. pp. 51-70):

1. Paragraphs 1 to 7, inclusive, of the Bill (Rec. pp. 32-35) are admitted. (Ans. § 1st; Rec. p. 52)

2. The excessive Skyline diversions, as alleged in paragraph 12 of the Bill (Rec. p. 37) are admitted, except that 677 acre feet less than the amount alleged were diverted in 1929. (Ans. § 6th; Rec. p. 54)

3. The location, description and capacity of the Bob Creek Ditch, as alleged in paragraph 14, subdivision 1, (Rec. pp. 38, 39) and the diversions, with slight modification as to the amount diverted in the year 1929 (Rec. p. 39), are admitted, the admitted diversion being 13 acre feet less than the amount alleged; also, the existence, location and description of the small Bob Creek extension ditch, as alleged in paragraph 14, subdivision 2, (Rec. p. 39) are admitted. (Ans. § 8th, subd. 1; Rec. pp. 57, 58)

4. The location, description, existence and dimensions of the Columbine Ditch, as alleged in paragraph 14, subdivision 3, (Rec. pp. 39, 40) and the diversions, except as to the year 1922 when it is alleged no water was diverted by the Columbine Ditch, are admitted. (Ans. § 8th, subd. 1; Rec. p. 58)

5. The existence, location, capacity and use of the Lost Lake Reservoir System (Rec. pp. 40, 41) are admitted. (Ans. § 8th, subd. 3; Rec. p. 60)

6. The pendency of proceedings in the District Court of Larimer County, Colorado, (Rec. pp. 44, 45) for the purpose of having adjudicated the authority to divert and store water in the Lost Lake Reservoir System, is admitted. (Ans. § 10th; Rec. p. 67)

7. The pendency of proceedings in the District Court of Larimer County, Colorado, (Rec. p. 45) for the purpose of having adjudicated the right to divert water through the Bob Creek Ditch, is admitted. (Ans. § 11th; Rec. p. 67)

The Defendant has pleaded in justification of these admitted acts, allegations which involve only the construction of the former decree. In defense of the admitted excess diversions through the Skyline Ditch (Rec. p. 37), Defendant pleads (Ans. § 6th; Rec. p. 55) that the total diversions from

the Laramie River to the Cache la Poudre River in those years did not exceed an aggregate of 37,750 acre feet of water and, therefore, such excess diversions were within the limit fixed by the decree in the former case.

The Defendant does not deny the alleged diversions of water in the amounts stated in paragraph 13 of the Bill (Rec. pp. 37, 38) for the irrigation of meadow lands, but states that by such diversions, there is not diverted and taken in the State of Colorado from the Laramie River and tributaries in Colorado, water in excess of the amount, by the said former decree authorized, for the purpose of the irrigation of 4,250 acres of meadow lands in Colorado. (Rec. pp. 55, 56)

In paragraph 8th of the Answer (Rec. pp. 58, 59), the Defendant states the purpose of the Bob Creek Ditch and the Columbine Ditch. In the third subdivision of paragraph 8th (Rec. pp. 60-62), Defendant seeks to justify the existence and use of the Lost Lake Reservoir System as an auxiliary to the Skyline Ditch.

The Admissions of Defendant

The admissions of Defendant as to the effect of the former decree, as alleged in paragraph 5th of the Bill (Rec. pp. 33, 34), are:

1. That the court found the annual water supply available for the appropriations in both Wyoming and Colorado to be 288,000 acre feet per annum. (Ans. § 1st; Rec. p. 52)

2. That the rights to divert 18,000 acre feet of water through the Skyline Ditch and 4,250 acre feet of water through the Meadow Land Ditches are entitled to priority over many of the Wyoming appropriations.

3. That these two recognized Colorado appropriations, totaling 22,250 acre feet of water, were not to be deducted from the 288,000 acre feet, which is the available supply after they are satisfied.

4. That the total available annual supply of water for irrigation in Wyoming and Colorado out of the Laramie River and tributaries is 310,250 acre feet, in addition to the water of Sand Creek.

As alleged in paragraph 6th of the Bill (Rec. p. 34):

1. That Wyoming appropriations, dependent upon the available water supply of 288,000 acre feet, cover 181,500 acres of land. (Ans. § 1st; Rec. p. 52)

2. That the amount of water appropriated and reasonably required for the irrigation of said lands, is 272,500 acre feet. (Ans. § 1st; Rec. p. 52)

3. That there remains 15,500 acre feet of water subject to appropriation by the Laramie-Poudre Tunnel. (Ans. § 1st; Rec. p. 52)

As alleged in paragraph 7th of the Bill (Rec. pp. 34, 35):

1. That the decree should not prejudice the rights of the State of Colorado or any one recognized by her as duly entitled thereto, to continue to exercise the right existing, and thereby recognized, to divert and take from the Laramie River and its tributaries in the State of Colorado,

(a) 18,000 acre feet of water per annum by virtue of, and through the Skyline Ditch appropriation in Colorado;

(b) 4,250 acre feet of water per annum by virtue of, and through the Meadow Land appropriations in Colorado. (Ans. § 1st; Rec. p. 52)

The question of the available water supply and the allocation thereof are settled and Colorado, by the above admissions, is foreclosed from now questioning the supply and the allocation thereof. These admissions are in full accord with the terms of the decree in the former suit as construed in the opinion of this Honorable Court in the case at Bar (286 U. S. 494; 76 L. Ed. 1245) and neither state can now well assert a lack of understanding of the limitations placed upon her right to enjoy the use of the waters of the Laramie River and its tributaries.

ISSUES OF FACT

1. Did the Defendant, State of Colorado, divert from the Laramie River, via the Laramie-Poudre Tunnel in the year 1926, more than 15,500 acre feet of water?

2. Did the Defendant, State of Colorado, divert from the Laramie River and its tributaries, by the Meadow Land

Ditches during the years 1926 to 1929, inclusive, for the irrigation of Colorado meadow lands, more than 4,250 acre feet of water per annum?

3. Did the Defendant, State of Colorado, divert from the Laramie River, via the Skyline Ditch during the years 1927 to 1929, inclusive, more than 18,000 acre feet of water per annum?

4. Are the admitted diversions by the Bob Creek Ditch, the Columbine Ditch and the Lost Lake Reservoir System, in violation of the terms of the decree in the former case?

5. Does the Defendant, State of Colorado, accurately gauge and measure the amount of water diverted by the Colorado appropriators recognized in the decree in the former case?

6. Is the Defendant, State of Colorado, entitled to appropriate from the headwaters of the Deadman Creek, any water? If so, how much?

7. Does the full protection of Wyoming rights in the use of the water of the Laramie River demand the placing of the supervision of the Colorado diversions under a Federal Water Master?

GENERAL STATEMENT OF THE EVIDENCE

Only a brief general statement of the evidence will at this point be made, inasmuch as the evidence will be subsequently discussed and referred to in connection with the points in issue.

The Defendant introduced much evidence relating to the method used in the irrigation of the Colorado meadow lands to prove that not more than 4,250 acre feet of water were annually consumed in their irrigation; that it is the practice in irrigating these mountain meadows, to divert unlimited quantities of water from the natural channel of the stream and cause this diverted water to spread over the surface of the meadow lands and eventually find its way back to the stream, less the actual quantity consumed.

The admitted excess diversions through the Skyline Ditch, Defendant contends, are legal and submits evidence that the total diversions from the Laramie River to the Cache la

Poudre River in the years complained of did not exceed, in the aggregate, the amount of 37,750 acre feet of water. Evidence of the same character is submitted by the Defendant with reference to the admitted Bob Creek Ditch and Columbine Ditch diversions.

The operation of the Lost Lake Reservoir System is defended upon the theory that water can be diverted thereby to supplement the Skyline Ditch appropriation, because the Lost Lake Reservoir System and the Skyline Ditch are the property of the same party.

The evidence of Complainant and Defendant relating to the Wilson Supply Ditch or the Sand Creek Ditch System appropriation presents no material conflict as to when the construction was commenced, when water was first diverted from Sand Creek, and when water was first diverted from the headwaters of Deadman Creek. But it is contended by Complainant that the facts, as established, show that the Deadman Creek diversion is illegal; that, no water having been appropriated prior to 1902, none can subsequently be lawfully taken under the terms of the modified decree. Defendant contends that under the doctrine of relation, she has an established right to appropriate annually to the Sand Creek Ditch System from Deadman Creek and tributaries, the water of Deadman Creek.

The Defendant has been diverting and taking the waters of Sand Creek and tributaries, an interstate stream, in disregard of the rights of appropriators in Wyoming whose water rights have dates of priority earlier than the claimed date of priority of the Colorado appropriation from Sand Creek.

SUMMARY OF ARGUMENT

The opinion rendered by this Honorable Court on Defendant's motion to dismiss, appearing in 286 U. S., page 494, 76 L. Ed., page 1245, construing the decree entered in the former case of Wyoming vs. Colorado, et al., reported in 259 U. S., page 419, 66 L. Ed., page 999, modified in the opinion appearing in 260 U. S., page 1, 66 L. Ed., page 1026, disposed of the major questions, leaving for consideration the construction of the language of the modified decree relating to Colorado's right to divert water from the headwaters of Deadman Creek and a determination of the relative rights of Wyoming appropriators and Colorado appropriators from Sand Creek.

In addition to the opinion rendered on the motion, reviewing the scope and effect of the former decree, the admissions of Defendant in her answer further simplify the questions still to be disposed of, which the Record discloses are facts established by evidence largely free from substantial controversy which, Complainant contends, clearly establishes her contention that Colorado has been departing from the former decree and, in disregard of the rights of Complainant, has been taking excess quantities of water from the Laramie River and its tributaries, which has resulted in Complainant being denied the right to have available for use in Wyoming, the amount of water which the Court found in the former decision should be available for such use after the recognized Colorado appropriations have been satisfied.

Complainant's discussion of the evidence and argument are confined to these remaining questions now submitted for the Court's determination.

PROPOSITIONS OF LAW

I

Material averments in the Bill of Complaint which are admitted by the answer, are accepted as established and evidence in support thereof need not be produced.

Clements v. Nicholson; Moore v. Clements, 73 U. S. 299, 315; 18 L. Ed. 786, 789.

Robertson v. Perkins, 129 U. S. 233, 235; 32 L. Ed. 686, 687.

Forsyth v. Doolittle, 120 U. S. 73, 74; 30 L. Ed. 586.

II

Facts once determined will not again be considered in a subsequent suit between the same parties or their privies.

Wyoming v. Colorado, 286 U. S. 494, 508; 76 L. Ed. 1245, 1251.

Southern Pacific R. Co. v. United States, 168 U. S. 1, 48, 50; 42 L. Ed. 355, 376, 377.

Southern Pacific R. Co. v. United States, 183 U. S. 519, 528; 46 L. Ed. 307, 312.

English v. Arizona, Use of Griffith, 214 U. S. 359, 361; 53 L. Ed. 1030, 1032.

III

Diversion of water from the natural channel of a stream into a constructed ditch or conduit does not alone constitute an appropriation of the diverted water; there must, also, be application of the diverted water to beneficial use.

Milheiser, et al. v. Long, et al., 10 N. M. 99; 61 Pac. 111, 113.
Willey, et al. v. Decker, Adm'r, etc., et al., 11 Wyo. 496, 537; 73 Pac. 210.
Whalon v. North Platte Canal and Colonization Co., 11 Wyo. 313, 342; 71 Pac. 995.
Farm Investment Co. v. Carpenter, et al., 9 Wyo. 110, 122; 61 Pac. 258.
Moyer v. Preston, 6 Wyo. 308, 321; 44 Pac. 845.
Weldon Valley Ditch Co., et al. v. Farmers' Pawnee Canal Co., 51 Colo. 545; 119 Pac. 1056, 1057.

Wilson, et al. v. Collin, et al., 45 Colo. 412; 102 Pac. 21, 22.
Petterson v. Payne, Water Com'r, et al., 43 Colo. 184; 95 Pac. 301.
Strickler v. City of Colorado Springs, 16 Colo. 61; 26 Pac. 313, 315.

Long on Irrigation (2d ed.) § 134, p. 234.
Wiel on Water Rights in the Western States (3d ed.) Vol. 1, § 381, p. 412; §§ 37, 38, pp. 36, 37; § 61, pp. 60, 61.
Kinney on Irrigation and Water Rights, (2d ed.) Vol. 2, pp. 1138, 1139.

The primary purpose of the present action is the protection of Wyoming rights under the decree of the United States Supreme Court, reported in 259 U. S., page 419, 66 L. Ed., page 999; 260 U. S., page 1, 66 L. Ed., page 1026, rendered in a former suit between the State of Wyoming and the State of Colorado which determined the relative rights of each state to divert and use for irrigation, the waters of the Laramie River. The questions to be now considered are limited to a construction of the former decree, (1) relating to the amount of water Colorado is entitled, under the former decree, to divert and take from the headwaters of Deadman Creek; (2) whether or not Colorado is entitled to divert the waters of Rawah Creek and other tributaries of the Laramie River under additional appropriations if the combined quantities diverted and taken from the Laramie River to the Cache la Poudre River, via the Tunnel, do not exceed annually, 15,500 acre feet; and (3) the relative rights of the appropriators under the laws of the two states to divert and take the waters of Sand Creek and tributaries. All other law questions are, upon the authorities referred to in support of the first and second propositions of law stated above, disposed of.

The answers to the two questions, the Deadman Creek diversions and the Rawah Creek diversions, depend exclusively upon the construction of the language of the former decree relating thereto. The determination of the relative rights of the Wyoming appropriators from Sand Creek to the right of the Colorado appropriator, must be settled by the application of the rule recognized in both states, that the appropriation first in time is first in right, although all appropriations from the stream are not withdrawn within the limits of the same state. (259 U. S. 419, 465; 66 L. Ed. 1013) The established dates of priorities of the Wyoming Sand Creek appropriations are free from dispute and the Colorado appropriation is admitted to have had decreed to it, priority date of June 15th, 1899.

In the former suit, this Honorable Court did not give consideration to, or have before it for determination, the relation of appropriators from Sand Creek in Wyoming to those in Colorado from the same stream and, further than to determine that Sand Creek is only nominally a tributary of the Laramie River, it was not given any consideration; however, because of the position taken by Colorado in the present action regarding diversions through the Wilson Supply Ditch, which diverts water not only from Sand Creek and its natural tributaries, but from the headwaters of Deadman Creek and other unnamed sources within the natural watershed of the Laramie River, the appropriations in both states have been shown in the Record and their relative priorities are displayed and the matter has been, without objection by either party, submitted on the merits and the determination thereof should be accomplished by the entry of such decree as the court shall find to be in accord with the facts as disclosed by the Record relating thereto.

ARGUMENT AND AUTHORITIES

I

The Laramie-Poudre Tunnel Diversion

In proof of the allegations of paragraph Ninth of the Bill (Rec. pp. 35, 36), Complainant offered in evidence her Exhibit No. 3, being a photostatic copy of Water Commissioner's Ditch Report, Water District No. 48, for the year 1926, (Rec. p. 974) which reports Tunnel diversions of 13,572 acre feet. This information is taken from an official record kept under the supervision of the State Engineer of the State of Colorado; and nothing could more forcefully illustrate the justice of Wyoming's complaint than the objection interposed by the attorney for Defendant, State of Colorado, to the admission of this exhibit:

Defense objects, "for the reason that it shows on its face that it is made from estimates and only partial readings, and as hearsay, and is incomplete, and it is not based upon daily measurements or other reliable data as required by law, and it is not the record required to be kept under the laws of the State of Colorado, and is not an original record of the office of the State Engineer of the State of Colorado, and as being incompetent, irrelevant and immaterial." (Rec. p. 165)

The character of the records and information which Wyoming has been compelled to rely upon with reference to the trans-mountain diversions from the Laramie River to the Poudre River, could not be better described than in the words of the above objection.

Contrasted with the information contained in this exhibit is the allegation in Defendant's answer, paragraph Third (Rec. pp. 52, 53), that 5,644 acre feet were, in the year 1926, diverted from the Laramie River, via the Tunnel, and no more. A repudiation of this official public record is found in the testimony of the witnesses for Defendant—Mr. Patterson, (Rec. p. 707) who gave a different figure—6,118 acre feet—as representing the total diversion by the Tunnel in the year 1926, although this witness says (Rec. p. 704) that the official records for the years 1926 to 1932 can be relied upon; and Mr. G. F. Smith, who testified to still another quantity—7,100 acre feet—for the year 1926, as being the extent of the Tunnel diversions of which he had any knowledge (Rec. p. 554), while Mr. Tipton (Rec. p. 851; Defendant's Exhibit No. D-3, Rec. p. 1611) gave 6,060 acre feet as the Tunnel diversion from May to September, 1926, and stated that DuVall's report for the same period gives 6,036 acre feet (Rec. p. 856), thus showing six different computations of amounts of water diverted by the Tunnel in 1926 in addition to the unreported quantities.

For the Complainant, three witnesses, Freeman, Powell and Zimmerman, testified to the fact that during the winter season of 1925 and 1926, unrecorded water was diverted from the Laramie River via the Laramie-Poudre Tunnel, and the witness Zimmerman testified that it is a common practice of the Defendant to make no record of the early and late diversions. (Rec. p. 125) Witness Freeman testified that on February 14th, 1926, water was passing from the Laramie River to the Cache la Poudre River unrecorded; that the gauge was not in operation. (Rec. pp. 146, 147) Witness Powell testified that the gauge was not operating on April 27th, 1926, when a flow of 27 second feet of water was being diverted through the Tunnel. (Rec. pp. 158, 159)

At pages 154 and 156 of the Record, is Mr. Freeman's statement that from December 13th, 1925, to May 3rd, 1926, approximately 3,000 acre feet of water passed through the Tunnel unrecorded. Mr. Freeman's statement (Rec. p. 148)

of his conversation with Mr. McAnelly as to what disposition is made of water that comes from the Laramie River into the Cache la Poudre River unrecorded, shows clearly that water from the Laramie River is diverted in quantities without any effort to keep a record thereof. The water commissioner of District No. 3 told Mr. Freeman that water diverted during the period when the gauge was not recording, was not accounted for (Rec. p. 152), and Mr. Powell stated that the unrecorded water is just distributed. (Rec. p. 159) Mr. Tipton says neither the water commissioner's reports nor the charts cover the total diversions in 1926. (Rec. p. 855)

The Defendant objected to anything said by the party living in the caretaker's quarters at the mouth of the Tunnel and in charge of the diversion works at the time of Mr. Freeman's December, 1925, visit, stating that the conversation of Mr. Freeman with Homer DuVall, in charge of the Tunnel diversion, was hearsay and that it was not certain Mr. DuVall was there in any official capacity. (Rec. pp. 146, 147; Testimony of witness Zimmerman, Rec. pp. 123, 124)

This is the condition of which Wyoming complains. There is no one in charge of the trans-mountain diversions from the Laramie River to the Cache la Poudre River who seems to have, or will assume any official responsibility for the operation of these diversion works or make and furnish any record of a reliable character. The testimony of Defendant's witness, G. F. Smith, is that Homer DuVall was in the employ of the Greeley-Poudre Irrigation Company as caretaker of the Laramie-Poudre Tunnel in 1925, up to December 13th, and in 1926, from March 24th to September 23rd (Rec. p. 552); but Mr. DuVall was the party found in charge of the Tunnel diversion as caretaker on February 14th, 1926. (Rec. p. 147) Mr. Mosier, the Colorado water official in District No. 48 where the trans-mountain diversions are made, said (Rec. pp. 544-546) that his records are inaccurate and cannot be relied upon.

Mr. Freeman's statement of unrecorded flow through the Laramie-Poudre Tunnel in 1926 is corroborated by witness Powell (Rec. pp. 158, 159) and witness Zimmerman (Rec. pp. 124, 125). There can be no doubt that water was, in the year 1926, being taken, without any record thereof being made, from the Laramie River to the Cache la Poudre River

via the Laramie-Poudre Tunnel diversion, which, together with the recorded flow, made a diversion for the year in excess of 15,500 acre feet. See testimony of Mr. Meeker (Rec. pp. 251, 253, 318) where the reported quantity for the year 1926 is also disclosed, the diverted quantity as reported being 590,120,320 cubic feet, which, converted into acre feet, are 13,572; and that it is a common practice to divert unreported and unrecorded water from the Laramie River to the Cache la Poudre River via the Tunnel diversion. (Testimony of witness Meeker, Rec. p. 251; Testimony of witness Zimmerman, Rec. pp. 125, 134)

The measuring device used to record diversions from the Laramie River via the Laramie-Poudre Tunnel, is operated under the personal supervision of the employees of the Colorado appropriators (Testimony of witness Turner for Defendant, Rec. pp. 560-562), and Wyoming's representative, Mr. Drummond, was not permitted to inspect the automatic gauge. (Testimony of witness Drummond, Rec. p. 171) The records made by these experienced or inexperienced employees constitute the basic data from which the official public records kept by Defendant are made. The necessity of possessing some experience to be able to make accurate discharge records, is testified to by witness Meeker for Complainant. (Rec. pp. 244-246)

Testimony by many experienced civil engineers was given relating to the installation and functioning of the improved Venturi flume, sometimes referred to as the "Parshall Flume," located at the outlet or east portal of the Tunnel where the measurments of the diverted water from the Laramie River for the Greeley-Poudre Tunnel appropriation are made. The quality of the evidence coming from many reputable and able experts upon this technical question of the measurement of flowing water in open channels or through measuring devices, even though in conflict upon the question of whether or not the installation is at a point where accurate results can be obtained within practical limits, is, for the most part, of high quality, given by experienced men.

There is no dispute that the device is of a standard, reputable type, in general use and, under favorable conditions, would perform in an acceptable and reliable manner if properly supervised by an experienced attendant; but there is no precedent, example or evidence from any of these wit-

nesses who knew of another instance where this type of measuring device had been placed in operation under conditions substantially similar to those prevailing at the location of the one under consideration. The designer, Mr. Parshall, admits that not even a test was ever made to determine accurate measurement of water passing through the flume where the throat of the flume was located at a curve from the direction of the approach channel, as in the instant case. (Rec. p. 680)

This particular type of measuring device is the product of some fifteen years of experiment and study by Mr. Parshall and he says that to get accurate results, the installation and supervision must be maintained by some one capable of operating the device in order to give proper records (Rec. p. 680); yet the actual operation of the Parshall flume at the east portal of the Tunnel is placed under the supervision of inexperienced men employed by the appropriators and, from the data furnished by such employees of the appropriators, the official public records are made. (Testimony of witness Turner for Defendant, Rec. p. 562)

Mr. Parshall has advised that the Tunnel installation is not a practical one. (Rec. p. 680. See, also, Complainant's Exhibit No. 97, Rec. p. 1209, being a memorandum statement of Mr. Parshall prepared in April, 1933, which condemns the Tunnel installation for well stated reasons that corroborate the testimony of the witness Meeker, Rec. pp. 281, 919, 922, 923; also, Complainant's Exhibits No. 57, Rec. p. 1069, and No. 100, Rec. p. 1212.) The testimony of these two outstanding, experienced and able engineers, Meeker for Complainant and Parshall for Defendant, whose ability and reputations are of the very highest, should be sufficient to establish beyond successful contradiction that the Tunnel installation is not a practical one and, therefore, records coming from it, prepared by inexperienced employees of the appropriators, cannot be accepted as accurate.

Mr. Lewis Stimson testified (Rec. p. 803) that on June 13th, 1933, sand and gravel were lodged within one foot of the staff gauge in the Venturi flume; and at page 269 of the Record, Mr. Meeker calls attention to the official statement of a former Colorado deputy state engineer who said (Rec. pp. 269, 270) that the Laramie-Poudre rating flume was the worst designed rating flume he ever saw and stated his

reasons, and Mr. Meeker stated his reasons for concluding that the Laramie-Poudre Tunnel Venturi flume was an unreliable measuring device. (Rec. pp. 271-275)

If the statements of Mr. Patterson, in describing the favorable location of the measuring flume on Sand Creek, (Rec. p. 725) are applicable when applied to the Laramie-Poudre Tunnel location, they would constitute a condemnation of its location; but Mr. Patterson also gives unreserved approval to the Tunnel flume location (Rec. pp. 738, 739) and says it is fortunate the approach channel has a bend in it.

Complainant submitted, in support of her allegation that the measurements of water diverted from the Laramie River to the Poudre River through the Laramie-Poudre Tunnel were not accurately made, her Exhibits Nos. 58 to 62, inclusive. (Rec. pp. 1070-1088) These exhibits are explained by Complainant's witness Meeker and the defects in the records and the careless manner in which they have been kept and made and the inaccuracy thereof, pointed out. (Rec. pp. 275-281) It is also pointed out that velocities of water passing through the flume are not uniform, and the note on Exhibit No. 59 (Rec. p. 1072) says, "Mrs. I. C. Turner, Observer, instructed how to read and replace charts and mark same." (Who is Mrs. Turner, and is she in charge of Tunnel diversion records?)

Defendant's witnesses Tipton (Rec. pp. 848, 849) and Patterson (Rec. pp. 704-724) contradicted the statements of Complainant's witness Meeker as to the deductions made by him as to the character of these records, Mr. Tipton stating that the Tunnel flume has performed well within practical limits. The evidence is not free from conflict as to the reliability of the data and information contained in these records, but there is no controversy as to how the same were obtained or as to who was in exclusive charge of these recording devices. Complainant has established that the records of the measurements of water diverted by the Laramie-Poudre Tunnel from the Laramie River to the Poudre River are not accurate and do not show the correct quantity diverted and that diversions are made each year without a record thereof being made. Whether the actual amount of water diverted by the Tunnel is more or less than 15,500 acre feet per annum, is immaterial; the Complainant is within her rights in insisting that an accurate measurement be

made and records showing accurate measurements of the total amount diverted should be available at all times.

Mr. Hinderlider defends the accuracy of the Colorado records and the method used by Colorado in measuring diversions of water from the Laramie River to the Cache la Poudre River and expresses a willingness on behalf of Colorado to cooperate with Wyoming in the measurement of water by such devices as are in operation to the end that Wyoming may be fully satisfied at all times with respect to the sufficiency and character of the data obtained. (Rec. pp. 812-814) This would not eliminate Wyoming's objections to the measuring and recording devices used as the basis of the records of water diverted from the Laramie River to the Poudre River, as they are operated only a part of the time and diversions are made each year through these diversion works between the dates of September and May, unrecorded.

Testimony of M. C. Hinderlider (Rec. p. 808): "The flume at the Poudre Tunnel is located in the only practical place where it might be located, because of the topographical and geographical conditions which prevail at the outlet of the Tunnel," giving his reasons therefor at page 810 of the Record. Mr. Hinderlider says that Defendant's Exhibit No. E-1, which appears at page 1494A of the Record, consists of the tabulation of all the current meter or discharge measurements made in the Venturi flume from the time it was installed up to and including the year 1932.

Defendant's Exhibit No. E-1, (Rec. p. 1494A) shows, in 1927, six meter measurements; in 1928, one meter measurement; in 1929, four meter measurements, three of which were made within the scope of a period of seven days; in 1930, four meter measurements; in 1931, no meter measurements; in 1932, eight meter measurements. This exhibit shows that no meter measurement was made before the 25th day of May and no measurement was made later than the 5th day of September in any year. This record supports Complainant's position that the record of diversions is not complete.

Mr. Hinderlider says (Rec. p. 811), from his experience and study of the results of discharge measurements made by means of current meter measurements in the present Venturi flume installed at the Laramie-Poudre Tunnel, regardless of the quantities of debris that from time to time accum-

ulate above and within the upper section of the rating flume, and regardless of the right angle bend in the concrete structure, such conditions do not materially affect the accuracy of the discharge of water through the throat section of the flume as determined by the theoretical rating curve. Mr. Baily, in Complainant's Exhibit No. 59 (Rec. p. 1071), contradicts Mr. Hinderlider's statement as to the accuracy of Tunnel measurements.

Witness R. J. Tipton (Rec. p. 828) says that he is employed by the State of Colorado as a special engineer in charge of interstate river investigations and water resource surveys; that one of his duties is to analyze the flow of interstate streams and the uses that are made of those streams, not only in Colorado, but in neighboring states through which those streams flow. At page 830 of the Record, Mr. Tipton says, in District No. 3, the Cache la Poudre River Basin reports are gathered very carefully and the reports as to the trans-mountain diversions into the Cache la Poudre Basin are determined each day, and states that the reports of trans-mountain diversions made by the water commissioner of District No. 3 are more accurate than reports made by any other water district in the state (Rec. p. 331); that these reports are determined and made from records of automatic charts by determining the hourly quantity as it flows past the particular point in question and from these hourly quantities, the daily quantity is determined.

The statement that reports from District No. 3 of trans-mountain diversions are more accurate than reports from any other Colorado district, only casts a reflection upon the reports from other districts, as the Record shows, without contradiction, that these District No. 3 records are incomplete, furnished by inexperienced employees of the appropriators, not under the supervision of any Colorado official, and the information which these employees furnish to the water commissioner by telephone constitutes the data from which the daily quantities are determined and the source from which the official record is made up.

Witness Tipton gives his description of the manner and conditions in which water emerging from the east portal of the Laramie-Poudre Tunnel passes through the Parshall Flume where the automatic register is supposed to be recording the volume of water passing over the crest of the

flume (Rec. p. 632), and at page 833 of the Record, he says that the water passes through the flume in a more or less uniform condition—passes over the crest of the flume in an absolutely regular manner. This witness refers to Defendant's Exhibit No. W-2 (Rec. pp. 1565-1570), being six photographs, and states that they show the conditions while the water is passing from the mouth of the Tunnel through the flume.

Complainant's Exhibit No. 100 (Rec. p. 1212B) is a series of six photographs showing the course of the Laramie-Poudre Canal where the water emerges from the throat of the Tunnel to the point where it passes over the crest of the Venturi flume and the testimony of witness Meeker (Rec. p. 920) describes these exhibits. At page 922 of the Record, are found Mr. Meeker's reasons why the Venturi flume, in his judgment, is not so located as to accurately record the volume of water passing through it. His observations are based upon actual tests and experience, in addition to which, the photographs show the actual conditions; while Mr. Tipton's observations are his deductions from what the photographs make apparent on the surface. The photographs do not disclose unbalanced velocities; this can only be determined by an actual test made by one qualified and equipped to perform that duty.

At pages 923-925 of the Record, is found the statement by witness Meeker to the effect that the adverse conditions existing at the east portal of the Tunnel for the accurate measurement of diverted water can be overcome at small cost by installing either a Venturi or a rectangular flume at the inlet canal at the west portal of the Laramie-Poudre Tunnel and his Exhibit No. 101 (Rec. p. 1212C), being three photographs to which he refers in his testimony (Rec. pp. 924, 925) regarding the advisability of measuring the diversions from the Laramie River to the Poudre River at the west portal rather than at the east portal of the Tunnel, corroborates his statements as to the difference in the physical conditions prevailing in that section of the diversion canal between the point of diversion from the Laramie River and the west portal of the Tunnel and those shown to exist at the east portal.

II

The West Side Collection Ditch

The West Side Collection Ditch is not specifically named in the amended Bill of Complaint, nor did any appropriation of water from Rawah Creek receive recognition in the former decree, and it is the contention of Complainant that the use of this ditch for the diversion of water from Rawah Creek is a new appropriation, not authorized by the former court decree (Complainant's Exhibit No. 84, Rec. pp. 1154-1160); that it has no connection with the Laramie-Poudre Tunnel appropriation which was recognized as having a right to divert not to exceed 15,500 acre feet of water annually from the headwaters of the Laramie River and the West Fork of the Laramie River in Colorado, which are the designated sources of water supply for the Laramie-Poudre Tunnel appropriation (Testimony of Mr. Coy for Defendant, Rec. p. 581), as Rawah Creek and other streams tapped by the West Side Collection Ditch are from two to six miles below the Laramie-Poudre Tunnel appropriation point of diversion (Testimony of Mr. Meeker, Rec. p. 322; Complainant's Exhibit No. 77, Rec. p. 1138) and their waters could not be diverted to the Cache la Poudre River without the operation of the newly constructed West Side Collection Ditch, which is now used to divert the Rawah Creek water and carry it through the Tunnel from the Laramie River Basin to the Cache la Poudre River.

Not until 1931 was a diversion of water from Rawah Creek to the Cache la Poudre River made and the water was commingled with the water taken from the headwaters and West Fork of the Laramie River under the Laramie-Poudre Tunnel appropriation. (Testimony of Mr. Moore, Rec. p. 593) The evidence is not conflicting as to the time when actual construction work was first commenced upon the West Side Collection Ditch or Lower Rawah Ditch. The actual construction was commenced prior to 1910 in pursuit of the purpose to construct a system of ditches to collect the waters of various streams tributary to the Laramie River under separate appropriations, although each proposed appropriation was to be a part of the Laramie-Poudre project. (Testimony of Mr. Meeker, Rec. p. 323)

The West Side Collection Ditch or Lower Rawah Ditch, as now constructed as an independent entity (Testimony of

Mr. Coy, Rec. p. 581), is the consummation of a purpose to divert the waters of Rawah Creek and other tributaries of the Laramie River emptying into it below the point of diversion of the Laramie-Poudre Tunnel appropriation after the original and, also, the second proposed plan of diverting the water of this stream had lapsed for more than twenty years. (Testimony of Mr. Coy, Rec. pp. 580-582)

There is some conflict in the evidence on the question of whether or not the present ditch, as constructed, is located upon the original survey. The witnesses of Complainant testified that the constructed ditch includes about one mile of new construction on a 1929 survey in addition to that called for in the original plan and survey (Testimony of Mr. Meeker, Rec. p. 324), while the witnesses of the Defendant testified that there has been no change in the location. The right-of-way location and amended right-of-way location maps (Defendant's Exhibit No. J, Rec. p. 1403) support the statements of Complainant's witnesses and indicate clearly that a change was made in the right-of-way location, which change called for an extension of the right-of-way about one mile beyond the original terminus. See testimony of Mr. Meeker (Rec. pp. 926, 927) where he states that the map (Defendant's Exhibit No. J, Rec. p. 1403), showing the amended location of the right-of-way extending the same about one mile, was not approved by the Secretary of the Interior until May 5th, 1924; also, testimony of Mr. Meeker (Rec. p. 324) relating to the West Side Collection Ditch or Lower Rawah Ditch as of 1913 and as completed in 1931.

Complainant's Exhibits No. 78 (Rec. p. 1140), No. 79 (Rec. p. 1141) and No. 80 (Rec. p. 1142) are convincing proof that only incompleted sections of the ditch were constructed prior to 1913. Complainant's Exhibits Nos. 6, 7, 8 and 9 (Rec. p. 986) show construction work in progress in 1929 across the floor of the Laramie River Valley in the construction of the West Side Collection Ditch; Complainant's Exhibits Nos. 78, 79 and 80 (Rec. pp. 1140-1142) show the character and state of construction work on the ditch in 1913.

The Lower Rawah Ditch is separate and independent, having no connection with the right of the Defendant to divert not to exceed 15,500 acre feet annually of the water of the Laramie River under the appropriation from the headwaters of the Laramie River and West Fork of the Laramie River

and tributaries above the point of diversion of the Laramie-Poudre Tunnel appropriation (Complainant's Exhibit No. 84, Rec. p 1155), recognized as an appropriation junior to the Wyoming appropriations in the former decree. This appropriation is separate and distinct from the Laramie-Poudre Tunnel appropriation, having its separate adjudication, quantity and source of supply (Complainant's Exhibit No. 84, Rec. pp. 1155-1160), and the right to use the Lower Rawah Ditch for the diversion of Rawah Creek water as shown by the adjudication decree, was conditioned that it be shown in a proper proceeding that it has been completed and water has been diverted and applied to the irrigation of lands within a reasonable time. (Rec. p. 1160)

The ditch was not constructed until 1931. There was no construction work between 1913 and 1930. It is not a recognized appropriation. It is an unlawful diversion which interferes with the right of Wyoming to obtain and use the waters of Rawah Creek and other tributaries of the Laramie River, appropriated by Wyoming users, and to which she is entitled after the recognized appropriations, including the Laramie-Poudre Tunnel appropriation from the headwaters of the Laramie River and the West Fork and tributaries, have been satisfied.

Mr. L. C. Moore testified (Rec. p. 593) that 13,000 acre feet of water were delivered to the Tunnel through the Lower Rawah Ditch in 1932. Rawah Creek is not a tributary of the West Fork of the Laramie River, nor of the Laramie River above the diversion point of the Laramie-Poudre Tunnel appropriation, and the water diverted therefrom is not subject to diversion under the Laramie-Poudre Tunnel appropriation which was recognized in the former modified decree.

The Defendant states this diversion to be authorized and legal as coming within the right of Colorado to divert through the Tunnel, 15,500 acre feet of water annually, construing the former decree to give the right to Colorado to resort to any means found desirable or necessary to secure, for diversion through the Tunnel, the stated amount annually; that this Honorable Court, in the former decree, recognized the right of future appropriations at any time and from any source to the extent of 15,500 acre feet annually.

It is Complainant's position that the determination of the relative rights of the States of Wyoming and Colorado were established by giving recognition to the then existing appropriations in both states in the order of their respective priorities, modifying the rights under the Wyoming appropriations to amounts determined by the Court to be sufficient for the proposed use as shown from the evidence, thereby leaving for the Colorado Laramie-Poudre Tunnel junior appropriation, 15,500 acre feet of water from the headwaters of the Laramie River, the West Fork and tributaries. (Modified decree, 260 U. S. 1, 66 L. Ed. 1026)

The appropriation of the Laramie-Poudre Tunnel, independent of any connection with the Laramie River System, was limited by the decree of this Honorable Court to the amount of 15,500 acre feet of water annually to be taken from the headwaters of the Laramie River and the West Fork of the Laramie River (See Wyoming vs. Colorado, 259 U. S. 489, 490; 66 L. Ed. 1023), and the source of supply was so limited in the findings of the Colorado District Court in the decree rendered in the adjudication proceedings. (Complainant's Exhibit No. 81, Rec. p. 1145; Complainant's Exhibit No. 82, Rec. pp. 1147-1149)

The Tunnel, as an agency of the contemplated Laramie River System, was not intended to appropriate any water, but to receive and carry the water appropriated by all the various separate appropriations composing the project. (Complainant's Exhibit No. 82, Rec. p. 1147) The Court, 259 U. S. 496, 66 L. Ed. 1026, refers to this junior appropriation in Colorado as being entitled to take 15,500 acre feet. There never has been more than one appropriation recognized by the United States Supreme Court decree of June 5th, 1922, that can divert through the Tunnel.

In the determination of the relative rights of the contending states to the use of waters of the Laramie River and tributaries, the Court recognized existing appropriations as the yard stick of measurement upon which to establish these relative rights and, except as Wyoming appropriations were modified as to quantity necessary for the purpose of the appropriations, the determination of these rights was made upon the basis of existing and recognized appropriations; and while the aggregate of these recognized Colorado appropriations indicates the total amount of water that can be

diverted from the Laramie River in Colorado, each of these recognized appropriations is limited with reference to the point of diversion and means of conveyance, as well as to the volume authorized.

Colorado's right of appropriation and diversion does not permit her, if the source of supply designated in the appropriation proves insufficient, to effect entirely new and additional appropriations and, after a period of more than twenty years, to be permitted to take the waters of other streams, in whole or partial substitution for the original source of supply named in the appropriation or in addition thereto. The necessary amount of water to satisfy the recognized Colorado junior appropriations was not, by the decree, guaranteed, even though the Court did recognize the fact that an advantage was given Colorado in being able to obtain the full measure of water allocated to her appropriations, as they would be satisfied from the headwaters of the river while Wyoming could only enjoy what eventually came down from Colorado into Wyoming.

Colorado's recognized appropriations cannot be satisfied by permitting Colorado to gather the water where she will by constructing new canals that will capture the water of the tributaries of the Laramie River many miles below the diversion points of recognized Colorado appropriations and carry it back up the valley to the west portal of the Tunnel for trans-mountain diversion. It would only require an extension of this process to capture every cubic foot of water in any tributary of the Laramie River in Colorado and return it to the Tunnel for trans-mountain diversion to the Cache la Poudre River.

There is no appropriation to the Laramie River System. Complainant's Exhibit No. 82 (Rec. p. 1[illegible]7), "In the Matter of the Adjudication of Priorities of Water Rights in Irrigation District No. 48," (being the Laramie River District) shows under proceeding designated "No. 76" (Rec. p. 1149), "*The Laramie River Tunnel of the Laramie River System,*" that the Laramie River Tunnel appropriation is a single unit of the Laramie River project or system and derives its supply of water from the Laramie River and the West Fork of the Laramie River and all tributaries of each of said streams entering the same above the point of diversion through the Tunnel.

—III—

The Meadow Land Diversions

In paragraph Thirteenth of the Bill, in subdivisions 1 to 4, inclusive, (Rec. pp. 37, 38) Complainant alleges excess diversions of the Laramie River water for the irrigation of Colorado meadow lands and the irrigation of acreage in excess of 4,250 acres. In support of these allegations, Complainant produced the annual official field books of the water commissioner, R. A. Mosier, of District No. 48, State of Colorado, being official records in the office of the State Engineer of Colorado. The contents of these records are referred to in the testimony of Mr. Meeker (Rec. pp. 304-318) and for the years 1926 to 1932, inclusive, these official public records show the following:

Year	Acres Irrigated	Acres Natural Hay Land	Acres cut for hay	Total Diversions of water a. f.	Page Reference to Record
1926	8,311	6,425		62,787.6	306
1927	8,076		5,972	54,151.0	307
1928	8,266		5,622	56,279.2	308
1929	8,436		5,947	58,773.8	310
1930	6,517		6,170		312
1931	7,710		6,291	39,183.0	314
1932	7,000	about	4,250	36,869.3	316
			(a. meadow lands)		

The above information constitutes what the official records in the office of the State Engineer of the State of Colorado, compiled by the official water commissioner in charge of Water District No. 48, State of Colorado, show as to quantities diverted during the years from 1926 to 1932, inclusive, through the meadow land ditches for the irrigation of Colorado meadow lands. (Testimony of Mr. Meeker, Rec. pp. 306-317)

The reliability of this information is challenged by Defendant. The water commissioner, Mr. Mosier, who made the records and verified the same, when called as a witness for Defendant, testified with reference to these records (Rec. pp. 537, 538, 544, 545) that the annual field reports, all verified by him as to acreage irrigated, are not accurate or reliable as to acreage irrigated (Rec. p. 544), but as to the volume of water diverted, are not disputed.

Much evidence was produced by Defendant relating to the method of irrigating the meadow lands by a so-called "flooding system", defending the legality of this method regardless of the amount of water diverted at the headgates of the ditches, contending that this manner of diversion and use did not deplete the available quantity of water for Wyoming by more than 4,250 acre feet and that such diversions were within the terms of the decree fixing the amount of water that Colorado could lawfully use in the irrigation of the meadow lands under the term, "divert and take from the river," placing a construction on these words in the modified decree (260 U. S. 1, 66 L. Ed. 1026) to the effect that this was an authorized consumptive use and that quantities in excess of 4,250 acre feet of water might lawfully be diverted from the natural channel of the stream to accomplish the consumption of the 4,250 acre feet. (Testimony of Mr. Hinderlider, Rec. pp. 411-414) This challenge to the limitation placed upon Colorado diversions for the irrigation of the meadow lands under the former decree, as construed by the United States Supreme Court in the case at Bar, is an effort to re-litigate a question which passed into final determination in the former case and cannot again be submitted for consideration in a cause between the same parties. (See Opinion in this case of May 31st, 1932, 286 U. S. 494, 507; 76 L. Ed. 1245, 1251)

The right of the State of Colorado to appropriate of the available water in the natural channel of the Laramie River in Colorado for the irrigation of meadow lands, 4,250 acre feet annually, was recognized in the decree entered in the former suit and in paragraph First of Defendant's answer herein (Rec. p. 52), Defendant admits her right to irrigate the Colorado meadow lands by water taken from the Laramie River to be so limited.

Complainant does not deny that the so-called "flooding system", as testified to by Defendant's witness, is a proper method of irrigating meadow lands; but Complainant does deny that Defendant can divert and take from the Laramie River and its tributaries in Colorado for the irrigation of the Colorado meadow lands, more than 4,250 acre feet annually, measured at points of diversion. This is the only controversial question relating to the meadow land appropriation for determination in this action by this Honorable

Court—to rule as to whether the words "divert and take" mean "to consume", as Defendant now contends, or means to take away from the common source of supply without reference to whether any portion of the diverted quantity ever returns to the channel of the stream.

The Record is free from controversy and is to the effect that the volume of water diverted from the Laramie River and its tributaries in Colorado for the irrigation of the Colorado meadow lands, is not measured at all. (Testimony of witness Mosier, Rec. p. 535; Testimony of witness Watson, Rec. pp. 190, 191) The practice that has prevailed as the method of irrigating these meadows is to permit the appropriator to divert unlimited and unmeasured quantities of water from the natural channel of the stream or common source of supply and permit this diverted water to meander over the surface of the meadow lands, a great portion of such water being never beneficially used (Testimony of witness Mosier, Rec. p. 534), the unused portion thereof eventually returning to the thread of the stream and either passing on down for Wyoming use or being again diverted for the irrigation of meadow lands located below the point of return. The only issue is whether there have been diversions of water for the irrigation of the meadow lands in excess of the amount authorized by the former decree to be legally taken for that purpose.

Wyoming's contention is that the diversions should be limited to 4,250 acre feet, headgate diversion; Colorado's contention is that her right to divert is unlimited, so long as she does not, by her taking of the water of the river for the irrigation of meadow lands, finally consume any portion of the common supply in excess of 4,250 acre feet. The answer to these questions is whether the decree in the former case intended to permit the measurement of this appropriation on the basis of consumptive use or on the basis of headgate diversion.

There is evidence of a substantial character showing a pronounced increase in the acreage of meadow lands being irrigated in Colorado with water taken from the Laramie River. (Testimony of Mr. Meeker, Rec. pp. 306-308; 894-904) Defendant's Exhibit No. I (Rec. p. 1402A) is a map prepared for Defendant by Mr. Downing, who testified (Rec. pp. 446-454) as to the purpose in making Defendant's Exhibit No. I

and the manner in which it was prepared, stating he was instructed to locate the intake, the end and intermediate positions of all ditches (Rec. p. 446); and at Record page 454, he states he did not see all the ditches, but from his observation, all ditches he saw appeared to be old, with no evidence of new work in the sections covered by his survey.

Mr. Meeker says the irrigated acreage is in excess of 4,250 acres. (Rec. p. 900) Mr. Downing says he did not visit or embrace in Defendant's Exhibit No. I (Rec. p. 1402A) the entire area and the only record Colorado had showing the meadow land acreage irrigated, was the official reports by the water commissioner of Water District No. 48, which, when accepted by Complainant as being correct, were immediately repudiated as to accuracy by the Defendant, State of Colorado, through the testimony of the official who made the reports under oath for the Defendant; and to establish the inaccuracy of the reports, Mr. Downing made a survey of a section of the Laramie River Valley in Colorado and testified that the map, Defendant's Exhibit No. I, shows a total of 4,234.5 acres as all the land he has classified as irrigated — sage brush, pasture and meadow lands. (Rec. p. 448) Although Mr. Downing does not unqualifiedly state that the total irrigated acreage is 4,234.5 acres, Mr. Meeker states positively that the irrigated acreage exceeds 4,250 acres and the official annual field book reports give the irrigated acreage as approximately 8,000 acres.

—IV—

The Skyline Ditch Appropriation

The complaint, with reference to the appropriation diverted through the Skyline Ditch, is that the full quantity of diverted water is not recorded; that the official records kept by the State of Colorado are not reliable in that these records do not disclose the actual amount of water diverted. The evidence on the question of the reliability of the Skyline Ditch records is not free from conflict as to the quantity diverted.

The testimony of the witness Meeker for Complainant (Rec. pp. 250-257), together with the information disclosed in Complainant's Exhibit No. 41 (Rec. p. 1009), indicates that a substantial volume of water—1,633 acre feet—was di-

verted via the Skyline Ditch in 1926, which was not reported by the water commissioner of Water District No. 3 in the State of Colorado, being the water district receiving the diversions from the Laramie River in Water District No. 48, and Colorado, prior to 1932, never attempted to regulate or limit Skyline diversions. (Testimony of Mr. Kluver, Rec. pp. 606, 607)

Defendant's witness Tipton testified that 4,458 acre feet are shown on the automatic gauge height charts for the period from June 6th to 26th, 1926, and said (Rec. p. 841) that in his opinion, in general, the charts for the Skyline Ditch are sufficiently complete and accurate for the determination of the discharge of the diversions from the Laramie River. Complainant's witness Meeker stated (Rec. p. 252) that 4,501 acre feet was the amount diverted as disclosed by the gauge height charts for the same period. The statement of Mr. Meeker (Rec. p. 252) that the amount shown by the water commissioner's report for the same period is in the amount of 2,868 acre feet, leaving a difference of approximately 1,633 acre feet between the quantity reported by the water commissioner's report and the amount shown on the gauge height charts (Complainant's Exhibit No. 41, Rec. p. 1009), is not controverted.

The measuring device installed for the recording of water diverted via the Skyline Ditch is not operated during the full time that water is being taken via the Skyline Ditch from the Laramie River. See testimony if witness Drummond for Complainant (Rec. p. 168) that at the time the Skyline Ditch was being opened up for early diversion in the spring of 1928, the automatic gauging device was not in operation; and the testimony of Mr. Patterson for Defendant (Rec. pp. 716-719) indicates that the automatic gauge on the Skyline Ditch operated only a portion of the time that water was being diverted in the years 1922 and 1932, and the Defendant, in an effort to determine the exact amount diverted by the Skyline Ditch for the years 1922 to 1932, inclusive, relies upon the opinion of the witness Patterson, who had never personally observed the diversions during the years in question and prior to June 10th, 1933, (Rec. p. 734) on which date he made an observation and obtained information from records furnished him by Colorado, but possessed no actual knowledge that such diversions occurred. He

did not consult and use all the available records in connection with his study, which forms the background for his opinion as to diverted quantities. (Rec. pp. 734-737)

The measuring device used to record diversions from the Laramie River via the Skyline Ditch, is operated under the personal supervision of an employee of the Colorado appropriators and the records made by such employee are private records kept by the appropriators, which are accepted by the Defendant and constitute the only available record of Skyline diversions. (Testimony of witness Kluver, Rec. pp. 605-607) Mr. Tipton testified at length and in detail (Rec. pp. 845-879) in explaining and attempting to defend the method used by Colorado in keeping the record of diverted quantities via the Skyline Ditch, the Tunnel and Sand Creek and, in general, his conclusions are an attempt to justify and approve the records of the State of Colorado, although he does admit that they are not complete as covering the full period of time in which diversions take place.

Complainant, in support of her allegations that the water diverted through the Skyline Ditch from the Laramie River, in addition to alleged excess diversions, is not accurately measured and reported, introduced her Exhibit No. 41 (Rec. p. 1009), which contains data compiled by Complainant's witness Meeker and taken from automatic gauge height charts recording diversion flow through the Skyline Ditch for a definite period stated in the exhibit in the year 1926, showing that 1,633 acre feet more were shown by the charts than the amount which was reported by the water commissioner of Water District No. 3 during the same period of time. The discrepancy in these two sources of information, as shown by the witness Meeker, is an established fact and sustains Complainant's contention that no accurate measurement is made, no matter which one of these records, if either, is correct or if they are both erroneous.

Defendant has admitted excess diversions by the Skyline Ditch, but contends that Wyoming rights have not been encroached upon as a result of either excess diversions or inaccurate measurements, inasmuch as the total diversions from the Laramie River watershed to the Cache la Poudre River have not in any year in question, exceeded the aggregate quantity which Colorado contends she is entitled to take and may take by any means convenient to her. In her

words, she was, in the former decree, allocated an aggregate quantity of water which could be taken and diverted legally through one or as many separate diversion works and through as many individual appropriations as she chose to recognize. (Testimony of Mr. Hinderlider, Rec. pp. 412, 413)

To sustain the logic of Colorado's contention on this point, she has been forced to advance her consumptive use doctrine as to the meadow land appropriation (Testimony of Mr. Hinderlider, Rec. p. 414), as the Record discloses, without controversy, that in each year it is the custom and practice to divert for the irrigation of the meadow lands in Colorado, headgate quantities, more than 50,000 acre feet of water annually. (Rec. pp. 306-316) If the doctrine of consumptive use measurement is not sustained in determining the present controversy, the doctrine of mass allocation would lead the Defendant to an embarrassing position, as the total diversions shown to take place, in the aggregate, would amount to more than 75,000 acre feet instead of 37,250 acre feet, exclusive of diversions from Deadman Creek.

—V—

The Bob Creek Ditch, Columbine Ditch and Lost Lake System

The Bob Creek Ditch, Columbine Ditch and Lost Lake System will be considered together, as they all present the same proposition.

The construction and effect of the modified decree in the former suit, as reviewed and construed in the opinion of May 31st, 1932, supra, relative to the rights of the two states to divert and use the waters of the Laramie River and its tributaries, and Defendant's admissions in paragraph First of her answer (Rec. p. 52) as to the allocation of available supply to the recognized Colorado appropriations as determined in said former decree, should eliminate the necessity of giving consideration to the defense that the Defendant, State of Colorado, now relies upon as a justification for her recognition of these diversions, i.e., that mass allocation was the purpose of the former decree; that all diversions recognized as legal and authorized under Colorado laws can legally appropriate and divert Laramie River water. (Testimony of State Engineer Hinderlider, Rec. pp. 411-413, 417, 818)

Each of the recognized appropriations is, as stated in Defendant's answer and as shown in the evidence, demanding the full amount of its appropriation. The Defendant has exhibited no purpose to surrender any portion of the quantity of water allowed to any recognized appropriation to enable a supply to be made available for the Bob Creek Ditch, the Columbine Ditch, or the Lost Lake System.

As to the Bob Creek Ditch appropriation, the Columbine Ditch appropriation and the Lost Lake System appropriation, Defendant again desires to re-litigate a question which has been finally determined. If these ditches and lake reservoir system existed at the time of the determination of the relative rights of these two states based upon existing appropriations, it must be assumed that they were considered in such determination and, not being recognized in the former decree as having rights to appropriations from the available supply, the Court, after determining the available annual flow to satisfy all appropriations in both states, determined the relative rights of the two states by allocating to each appropriation in the State of Colorado that obtained recognition in said proceeding, a stated quantity of water to be obtained by and through existing, designated ditches, leaving the remainder of the available water supply to the State of Wyoming. Whether that remainder should be less or more than the 272,500 acre feet which the Court determined would be available to Wyoming users if reasonable storage be provided to capture the total available remaining annual supply, is now immaterial, as both states are bound to respect the decree. (Wyoming vs. Colorado, 259 U. S. 485; 66 L. Ed. 1021) Any encroachment by Defendant on Complainant's right to enjoy the remaining quantity of water is an injury to Complainant.

The contentions of the Defendant as to the Bob Creek Ditch, the Columbine Ditch and the Lost Lake System, cannot now recieve recognition. Such diversions are illegal and in violation of the decree in the former suit and are against the equitable rights of the State of Wyoming to appropriate and use the water remaining after the recognized Colorado appropriations are satisfied. (Opinion, 286 U. S. 501; 76 L. Ed. 1248)

Complainant's Exhibit No. 16 (Rec. p. 989) is a letter from C. C. Hezmalhalch, chief clerk in the office of the State Engineer of Colorado, written in 1923, wherein Mr. Hezmal-

halch admits that the Laramie and Lost Lakes are in the Laramie River watershed and not subject to appropriation on account of the Wyoming-Colorado water suit. See, also, Complainant's Exhibit No. 17 (Rec. p. 989) wherein it is stated that no decrees have been awarded to either the Lost Lake or Laramie Lake.

"If no further opinion is handed down by the Supreme Court with reference to Bob Creek and Columbine Ditches, we would use it." Testimony of Roy A. Portner. (Rec. p. 612) (Testimony of Mr. Hinderlider, Rec. p. 816) These ditches are capable of diverting, and do divert and take away from Wyoming, substantial quantities of water. (Rec. pp. 610, 611)

—VI—

The Wilson Supply Ditch

In the modified decree of October 9th, 1922, entered in the original proceeding, is the following proviso (260 U. S. 1, 66 L. Ed. 1026):

> "* * * this decree shall not * * * prejudice the right of the state of Colorado, or of anyone recognized by her as duly entitled thereto, to continue to exercise the right now existing and hereby recognized to divert and take from the headwaters of Deadman Creek, a Colorado tributary of the Laramie River, the relatively small amount of water appropriated therefrom prior to the year 1902 by and through what is designated in the evidence as the Wilson Supply Ditch; nor prejudice or affect the right of the State of Colorado or the State of Wyoming, or of anyone recognized by either state as duly entitled thereto, to continue to exercise the right to divert and use water from Sand Creek, sometimes spoken of as a tributary of the Laramie River, in virtue of any existing and lawful appropriation of the waters of such creek."

The controversy presented in the case at Bar involving the question of the right of Colorado to divert and take from the headwaters of Deadman Creek that relatively small amount of water appropriated therefrom prior to 1902 by and through the Wilson Supply Ditch, hinges upon whether there was an existing appropriation of water from the headwaters of Deadman Creek prior to 1902 and, if such appro-

priation had in fact been made, then what was the relatively small amount of water that had been appropriated from the headwaters of Deadman Creek prior to 1902? There is no available record that Complainant can find, nor any evidence produced by Defendant, showing what that relatively small amount of water was.

The United States Supreme Court, in determining the relative rights of the States of Colorado and Wyoming, recognized existing appropriations with priorities controlling the order of recognition, found the available water supply needed to satisfy these appropriations and made an allocation thereof to each of the two states.

The Wilson Supply Ditch, also called "Sand Creek Ditch System," "Divide Ditch," or "Deadman Ditch," (Testimony of witness Fleming, Rec. p. 91) shown on the plat, Complainant's Exhibit No. 5 (Rec. pp. 983, 984A; also, Defendant's Exhibit No. J-1, Rec. p. 1496B), which Exhibit No. 5 is the statement of claim for the Wilson Supply Ditch, used now to appropriate and divert the waters from the headwaters of Deadman Creek, was not in existence in 1902. Witness Eaton testified (Rec. pp. 642, 658-666) that Deadman Ditch (which is the same as the Wilson Supply Ditch) was built in the summer of 1902 and after water was running therein, they continued building on up to the next creek, but did not reach the next creek until the summer of 1903. Further testimony to support Complainant's contention that no water was appropriated from the headwaters of Deadman Creek via the Wilson Supply Ditch prior to 1902 is unnecessary; however, the testimony of Mr. Eaton is fully corroborated by witness Fleming (Rec. p. 89) and Complainant's Exhibit No. 1 (Rec. p. 957); witness Olson (Rec. pp. 136, 137); Complainant's Exhibit No. 2 (Rec. p. 971); witness Worster (Rec. pp. 95-99); witness Williams (Rec. pp. 100, 101); witness Lundquist (Rec. pp. 101, 102); and witness Wurl (Rec. p. 108).

The Wilson Supply Ditch is used to capture the waters of other sources than the headwaters of Deadman Creek. (Testimony of witness Watson, Rec. pp. 184, 185) The Sand Creek Ditch System or Wilson Supply Ditch was not completed prior to 1902. (Testimony of witness Fleming, Rec. pp. 87-89; Complainant's Exhibit No. 1, Rec. pp. 958, 965-969) Water was first diverted through that section of the Divide Ditch connecting Sand Creek with Sheep Creek on or about May 9th, 1902.

The decree for the Sand Creek Ditch System appears in the Record at pages 664 and 665; the findings upon which the decree is based appear in the Record at pages 663 and 664, where the Court found (Rec. p. 664) that claimant was entitled, by appropriation, to the use of water from named streams, to Priority Number 38, by construction. No determination of any definite quantity of water was therein decreed or adjudicated as having been appropriated from the headwaters of Deadman Creek. The conditional adjudication to the Sand Creek Ditch System is Defendant's authority for diversion of water from the headwaters of Deadman Creek, but the validity of the diversion is, under the terms of the former modified decree, dependent upon an appropriation made prior to 1902. The Record does not show that an appropriation from Deadman Creek has yet been made in compliance with the laws of Colorado.

The Record in the case at Bar shows that, in a special proceeding, the date of priority for the Sand Creek Ditch System was fixed as June 15th, 1899, but an appropriation of a stated quantity of water from the headwaters of Deadman Creek has not been determined or adjudicated and no measurement or record of the quantity of water diverted from the headwaters of Deadman Creek was made. (Testimony of witness Drummond, Rec. pp. 173, 174) The specific language of the decree is,

> " * * * that there be allowed to flow into said ditch from said streams, for the use and benefit aforesaid, under and by virtue of said appropriation by construction, Priority Number thirty-eight, two hundred and eighty-eight cubic feet of water per second of time, or so much thereof as may be necessary to irrigate fifty thousand acres of land, * * *."
> (Rec. pp. 664, 665)

There are no findings in this proceeding of facts to show that an appropriation of water had been made. The date of priority, June 15th, 1899, is definitely fixed; nothing more.

The decree says there shall be allowed to flow into the Sand Creek Ditch System, 288 cubic feet of water per second of time. The point of diversion is not designated. The decree is not grounded upon any finding of actual diversion and application to beneficial use of any quantity of water, while the statement of claim for the Wilson Supply Ditch

(Complainant's Exhibit No. 5, Rec. p. 984) has a stated maximum carrying capacity of only 117 cubic feet of water per second of time for that part of the ditch between Deadman Creek and Sand Creek.

The appropriation from the headwaters of Deadman Creek is claimed by Defendant to have been made earlier than 1902 by application of the doctrine of relation. There is no contention on the part of Colorado that water was taken from the headwaters of Deadman Creek prior to 1902, her position being that under the doctrine of relation, because the survey for the Divide Ditch was commenced in 1897 and actual construction work on that section of the ditch between Sheep Creek and Sand Creek, called the "Divide Ditch," was commenced prior to 1902, that thereby, Colorado now has a right under the terms of the modified decree, to appropriate and take, under the Sand Creek Ditch System appropriation, 288 cubic feet of water per second of time with priority date June 15th, 1899, from tributaries of the Laramie River, including Columbine Creek and its tributaries, Deadman Creek and its tributaries and Sand Creek and its tributaries. The decree in the former case, as modified, does not establish such right. The source from which the relatively small amount was to come, was specifically stated as the headwaters of Deadman Creek. Prior to 1902, there had never been an appropriation of water from the headwaters of Deadman Creek.

Defendant seeks to establish the existence of the Deadman Creek appropriation prior to 1902 by relying upon the doctrine of relation for its date of priority by reason of construction commencing prior to 1902 upon a ditch to divert water from another independent stream—Sand Creek—of which Deadman Creek is not a natural tributary (259 U. S. 489) nor located in the same watershed. Colorado does not claim water had been actually appropriated by diversion from the headwaters of Deadman Creek prior to 1902. The Supreme Court of the United States, in the former modified decree, authorized the taking by Colorado in the future of only that relatively small amount of water from the headwaters of Deadman Creek which had been appropriated prior to 1902 and the uncontradicted testimony is that no quantity of water had been diverted and taken from the headwaters of Deadman Creek prior to 1902.

The construction of the section of the Sand Creek Ditch System known as the Divide Ditch in 1901, connecting Sand Creek with Sheep Creek, or the actual diversion of Sand Creek water through that ditch in 1902 from Sand Creek into Sheep Creek, has no connection with the later diversion of water from the headwaters of Deadman Creek. The date of priority for the Deadman Creek appropriation is wholly immaterial. If any quantity of water was diverted and taken from the headwaters of Deadman Creek by Colorado prior to 1902, diversions in like quantity can be continued. If no appropriation was made prior to 1902, none could after said date be lawfully made under the court decree as modified.

There is no occasion to seek a determination of relative rights to the use of the water of Deadman Creek as between Wyoming and Colorado. Such rights were finally determined in the former modified decree, as Deadman Creek is a natural tributary of the Laramie River. Its flow constitutes a portion of the available annual supply which was allocated between Colorado and Wyoming in the former case. Under the decree, there could be no increased diversions after 1901 over what was actually appropriated by a diversion and taking prior to 1902.

Witness Drummond testified the Wilson Supply Ditch has been enlarged (Rec. p. 176), and witness Watson testified that a program of enlargement has recently, prior to 1929, been initiated to increase the size of the Wilson Supply Ditch. (Rec. pp. 185-188) See, also, Complainant's Exhibits No. 11 to No. 15, inclusive, (Rec. pp 988A to 988E) being photographs of conditions of portions of the Wilson Supply Ditch.

The District Court of Larimer County, Colorado, under date of October 6th, 1906, adjudicated to a ditch, Number 36, named "Sand Creek Ditch System," drawing its supply of water from Columbine Creek, Deadman Creek and Sand Creek and their tributaries by means of ditches formerly known as Columbine Ditch, Deadman Ditch, the channel of Sand Creek and a ditch connecting Sand Creek with Sheep Creek, whereby all the waters of the system are discharged into the Cache la Poudre River, the Court stating that the Sand Creek Ditch System was entitled to the use of the waters from said streams, by appropriation, to Priority Number 38, *by construction thereof*, to the quantity of 288

cubic feet of water per second of time with date of priority June 15th, 1899. (Defendant's Exhibit No. G, Rec. pp. 1262-1267) There is not in the Record, nor could Complainant find any record of an adjudicated right for an appropriation of the headwaters of Deadman Creek in any stated quantity for any stated purpose. The appropriation adjudicated to the Sand Creek Ditch System is relied upon by Defendant, Colorado, as constituting an appropriation of water from the headwaters of Deadman Creek.

—VII—

Water Supply

The primary right of the Complainant, which it is alleged is being violated by the Defendant and, if permitted to continue, will increase the injury to Complainant, is the taking by Colorado from the Laramie River and tributaries of more than the quantity of water to which she is entitled under the decree in the former case wherein the relative rights of these two states and of all users under the laws of either state to the use of the waters of the Laramie River and tributaries, were determined, except as to Sand Creek. It is alleged in paragraph Twentieth of the Bill (Rec. pp. 46, 47) that this available water supply will be, by said unlawful diversions made by the Defendant, if permitted to continue, gradually reduced and finally consumed.

The right of Wyoming in the use of the waters of the Laramie River and tributaries is not based upon any definite annual quantity. It may be more than 272,500 acre feet in a given year or successive years, or it may be less than this quantity; and when a shortage of water supply exists by reason of insufficient precipitation or snowfall upon the Laramie River watershed, Wyoming can make no just complaint against the recognized Colorado appropriations taking their full appropriations when water is available therefor, as awarded to them under the decree, and can claim only the remaining water after these recognized Colorado appropriations, including the 15,500 acre feet for the junior Laramie-Poudre Tunnel appropriation, have been satisfied from the authorized sources of supply. (259 U. S. 485, 66 L. Ed. 1021)

The Court recognized the position of Wyoming with relation to Colorado in the ability of the two states to satisfy the recognized appropriations when it said:

> "The water to satisfy the Colorado appropriations is, and in the nature of things must be, diverted in Colorado at the head of the stream; and because of this those appropriations will not be affected by any variation in the yearly flow, but will receive their full measure of water in all years. On the other hand, the Wyoming appropriations will receive the water only after it passes down into that state, and must bear whatever of risk is incident to the variation in the natural flow." (See Wyoming v. Colorado, et al., 259 U. S. 419, 485; 66 L. Ed. 999, 1021)

With Wyoming being entitled only to the remainder of water available after the recognized Colorado appropriations have diverted their full measure each year, a diversion by any of the recognized Colorado appropriations in excess of authorized quantities, or a diversion of water in Colorado under an appropriation not recognized in the former decree, constitutes a direct encroachment upon the rights of Wyoming. Her interests in the available waters of this stream and tributaries have been determined and made to depend upon the seasonal supply available. She must have storage facilities available to obtain any benefit from high flow and she must sustain the injury caused by shortage without complaint if Colorado diversions to satisfy her recognized appropriations be held within their lawful limits.

In the former case, the Court found the entire supply of water available to satisfy Wyoming appropriations and the Laramie-Poudre Tunnel appropriation to be 288,000 acre feet (259 U. S. 488, 66 L. Ed. 1022); and, further, that of this quantity, there were available for the junior Laramie-Poudre Tunnel appropriation, 15,500 acre feet of water annually, the balance being necessary to satisfy existing Wyoming appropriations. (259 U. S. 496, 66 L. Ed. 1026) In determining the relative rights of these two states in the use of the waters of this stream, the Court recognized that the average yearly flow of all years could not be accepted as a proper or safe measure of the available water supply to satisfy the Wyoming appropriations that were senior in time to the junior Laramie-Poudre Tunnel appropriation.

The Court concluded that the natural and varying flow of this stream at Woods, which is after the recognized Colorado appropriations have been satisfied, is susceptible, by means of practical storage and conservation, of being converted into a fairly constant and dependable flow of 170,000 acre feet per year, but not more; that this dependable flow was 20,000 acre feet less than the annual average flow; that the average annual flow, so converted into a fairly constant and dependable flow by the means of storage, would be sufficient to satisfy Wyoming appropriation, and leave available for the junior Laramie-Poudre Tunnel appropriation, 15,500 acre feet annually.

To ascertain the relation in the average annual flow of the Laramie River during the period of 1923 to 1932, inclusive, at Woods, to the amount the Court determined should be the available water supply, studies were made by Elmer K. Nelson and Ralph L. Meeker for the Complainant, and by R. J. Tipton for the Defendant. The Nelson study, Complainant's Exhibit No. 35, (Rec. p. 1006), shows average or mean annual runoff at Woods Station to be, for the period in question, 149,960 acre feet of water; the Meeker study, Complainant's Exhibit No. 54 (Rec. p. 1060; Testimony of witness Meeker, Rec. p. 266), shows the average or mean annual runoff at Woods Station to be, for the same period, 150,000 acre feet of water.

Mr. Tipton states (Rec. p. 874) that the average water supply at Woods Station during the period from 1923 to 1932, is 150,200 acre feet annually; that during the period from 1925 to 1932, the mean flow passing Woods Station was 141,400 acre feet; (Rec. p. 874) also, that Colorado uses are increasing. (Rec. p. 868) The Meeker water discharge and supply studies, Complainant's Exhibits No. 42 to No. 54, inclusive, (Rec. pp. 1009-1060) show a careful, competent and exhaustive study by a qualified expert in their preparation and are the basis of Mr. Meeker's statement regarding present water supply being adversely affected by Colorado's excessive diversions. (Testimony of Mr. Meeker, Rec. pp. 260-267)

The average annual flow of the Laramie River at Woods Station for the period from 1923 to 1932, inclusive, is not in dispute. The Record shows this average annual flow at Woods is, approximately, during that period, 20,000 acre feet less annually than the Court found should be available

in the former case. The Record shows that the average flow at Woods Station during the past ten years has not equalled by 20,000 acre feet what this Honorable Court considered should be available by means of storage for Wyoming appropriations as a fairly constant and dependable flow.

If this shortage of water at Woods is the result of natural causes, Wyoming cannot complain; but with a condition prevailing as revealed by the Record—no accurate measurements of diverted quantities (Testimony of Mr. Meeker, Rec. pp. 250-252), many additional ditches being permitted to divert, the recognized ditches constantly taking more than their authorized annual appropriations and no effort being made to regulate or keep within the limits of the recognized appropriation for the meadow ditches (Testimony of Mr. Watson, Rec. p. 190)—it cannot be logically urged that the existing shortage is caused by natural conditions.

It is reasonable to contend that a prohibition of further use of the Bob Creek Ditch, the Columbine Ditch, the Lost Lake Reservoir System and a limitation of meadow land quantities by headgate diversion to 4,250 acre feet and a limitation of the Skyline Ditch diversion to 18,000 acre feet annually, the prohibition of diversions from Deadman Creek being taken by the Deadman Ditch and the accurate measurement of diverted water, will account for the loss that Wyoming has sustained during the immediate past years. See the testimony of Mr. Meeker (Rec. p. 910); testimony of Mr. Nelson (Rec. p. 236); and Mr. Tipton says there is no question but what some of the decreased flow is due to increased uses by Colorado users. (Rec. p. 868)

The Defendant has submitted a study by Mr. Tipton, who bases his conclusions upon comparative studies, largely of the Cache la Poudre River water supply over a stated period with the water supply of the Laramie River for a different period of time within the same years (Testimony of Mr. Meeker, Rec. p. 909), and from these conclusions thus obtained, this witness states that Wyoming has not experienced a shortage of water at Woods Station which can be charged to increased trans-mountain diversions in Colorado or to anything other than natural causes. (Testimony of Mr. Tipton, Rec. p. 868) The basis upon which Mr. Tipton had determined that Colorado has not been departing from the decree in the quantities diverted or in the number of ditches

permitted to divert, is an effort to bring down to date the study made in connection with the former Wyoming-Colorado case when a controlling issue was the determination of the actual flow and annual available flow of the Laramie River so that a division of the water between the two states could be made upon an equitable basis and, in that case, the question was finally settled.

At Record, page 858, Mr. Tipton points out that Mr. Meeker made a similar study or proceeded on similar lines in studying water flow many years ago. This does not establish any facts in favor of Defendant in this case. The Meeker study at that time was for the purpose of determining the flow then not established; at the present time, it has been determined so far as Colorado and Wyoming are concerned and is not a question for review.

A comparative study of annual water supply of the Cache la Poudre River and Laramie River was recognized in the former Wyoming-Colorado case (259 U. S. 479, 66 L. Ed. 1019) as admissible to aid in determining the water supply; but that question was there finally determined and the comparative studies now submitted by Colorado's witness Tipton are valueless. Mr. Meeker has stated the existence of those adverse conditions between these two stream flows which prompted The Honorable United States Supreme Court to reject such data as a reliable source of information in the former case when a comparative study properly prepared would have been helpful. (Rec. pp. 908-911)

The water supply or stream flow of other interstate streams during the same period is immaterial. The question at issue in the case at Bar is not to determine what the available supply is, but to determine if Wyoming is being denied any water that is available to which she is entitled under the former decree by reason of Colorado taking more than she is lawfully entitled to. The available water supply to meet the demands of both Colorado's recognized appropriations and Wyoming's appropriations is not now open to question. It was finally determined in the former case and Colorado's evidence on comparative stream flow studies of the Laramie River and other streams relates to a question that is wholly immaterial.

Mr. Tipton finds that the mean trans-mountain diversion from the Laramie River in Colorado by all Colorado users during the period from 1925 to 1932, including Sand Creek

diversions, was 28,040 acre feet; that this is 83% of 33,500 acre feet; and if the use by the meadow lands of approximately 4,250 acre feet is added to the trans-mountain diversions, the total use during the period of low flow water supply from 1925 to 1932 by Colorado users, was 32,390 acre feet, being 86% of 37,750 acre feet. (Rec. p. 874) These analyses come from a study based upon theories that have no material connection with determining what Wyoming is entitled to receive, or does receive, based upon the figure 154,500 acre feet at Woods. There is, likewise, no necessity for ascertaining the percentage relation of 28,040 acre feet of trans-mountain diversion to 33,500 acre feet.

Sand Creek diversions are, also, entirely foreign to the authorized diversions of 33,500 acre feet for the Laramie-Poudre Tunnel and Skyline Ditch appropriations and the further analysis to determine the relation of 28,040 acre feet of water, plus 4,250 acre feet, to 37,750 acre feet of water, on a percentage basis, involves both the element of actual trans-mountain diversion, determined by the use of inaccurate, questionable, part-time records and an illegal consumptive use of unknown amounts as a basis for meadow land irrigation, when the Record shows actual diversions during each of the years from 1926 to 1932, inclusive, for the irrigation of these meadow lands, greater in amount than the total authorized diversion in the State of Colorado for all uses; and this second analysis also embraces Sand Creek diversions which, except the relatively small amount (though wholly undetermined) to be diverted from the headwaters of Deadman Creek, constitute no portion of the quantity authorized to be taken from the Laramie River. The figures used are taken from the Colorado records which cover the months from May to September, inclusive, of each year only and are neither accurate nor complete for that period, plus an estimate of the amount consumed in meadow irrigation, with no allowance for unreported diverted quantities which the Record shows it is a common practice to divert in early and late periods of each year with no record or measurement made thereof.

The study does not indicate whether the amount of Skyline Ditch diversions used was based upon reports of the water commissioner of District No. 3, being 2,868 acre feet for 1926, or the amount shown by the automatic gauge charts for 1926, being 4,501 acre feet. To consider as reliable the

conclusions offered, one must accept at face value all records used by Mr. Tipton in his study, whether administrative reports of the water commissioner of District No. 3 or automatic gauge charts or both, supplemented by his estimates to fill in where there are no records, and this is asking too much from what the records disclose to have been the practice in compiling the same.

Automatic chart records are not complete and are, in most instances, read and reported by inexperienced individuals employed, not by the State of Colorado, but by appropriators of Laramie River water in Colorado, who phone their information to the water commissioner of the receiving district as the basis of distribution. There are no automatic gauge chart records available for the years prior to 1926 for the Laramie-Poudre Tunnel and none for the Skyline Ditch for the year 1922. All automatic gauge chart records of trans-mountain diversions from the Laramie River in Colorado were destroyed. Administrative reports do not include unreported diversions.

Mr. Tipton determined the relation of Colorado appropriations to Wyoming rights upon the basis of mass diversions which, with the use of arbitrary figures of (unauthorized) consumptive use measurement, is determined without the aid of any actual facts. (Rec. p. 874) The necessity of having in operation automatic recording gauges to measure the diversions from streams where they occur at high altitudes, is shown by the testimony of Mr. Meeker (Rec. pp. 245-249) and Complainant's Exhibits Nos. 37, 38, 39 and 40 (Rec. p. 1008).

The water commissioners are required to keep a record of the amount of land irrigated in their water districts, the character and acreage of crops grown and, in general, the total amount of water distributed in their districts each year for various uses. These records are tabulated and filed in the office of the State Engineer for permanent record. (Testimony of Mr. Hinderlider, Rec. p. 395) Water commissioners in Colorado are not authorized by law to make ditch ratings and measurements of water diverted by irrigation ditches. These officers determine the amount of water diverted by a ditch from an official rating card or rating table which they obtain from the office of the State Engineer. If they should not be furnished with such rating table, they would only be able to make estimates. They could not accu-

rately determine the amount of water diverted. No water user, owner, superintendent of canals or ditches or reservoirs has any authority to make official determination, under the law, of the amount of water diverted by the owner of the canal, unless he is deputized by the State Engineer to perform such service. (Testimony of Mr. Hinderlider, Rec. p. 400) This statement should be sufficient proof that the diversions from the Laramie River to the Cache la Poudre River through the Laramie-Poudre Tunnel and the Skyline Ditch are not reported or the records kept in an official or legal manner.

Mr. Hinderlider says (Rec. p. 401) that it is necessary, under the laws of Colorado, for water officials to make an accounting of trans-mountain diversions in order to protect those making such diversions so that they may take out of the Cache la Poudre River the proper amount of water, and that appropriators from the Cache la Poudre River may be protected against excessive or illegal diversions from the Cache la Poudre River; but such system of recording trans-mountain diversions from the Laramie River is not shown to be followed by those making trans-mountain diversions. If an accounting were made, it would not prevent the appropriators from the Cache la Poudre River from enjoying the use of all waters that flow from the Laramie River into this river that are not reported and treated, as Mr. McAnelly, the commissioner of District No. 3 in which the Cache la Poudre River flows, testified, as foreign water or just water belonging to the Cache la Poudre River and is, therefore, available for diversions by any Cache la Poudre appropriator. It is only the amount of water diverted from the Laramie River of which there is a record that has to be delivered to those who are entitled to have the use of the diverted water from the Laramie.

The appropriators constantly watch each other and continually watch the water officials having charge of the administration of such trans-mountain diversions, and naturally insist that the measuring and recording devices should be adequate and efficient and the records kept accurately. (Testimony of Mr. Hinderlider, Rec. p. 402) It may appropriately be surmised that the appropriators have to watch only each other in the matter of trans-mountain diversions from the Laramie River to the Poudre River. The appropriators are in charge of the diversion works. Their em-

ployees are the only ones supervising and making private records of such diversions and for their own use. (Testimony of Mr. Kluver, Rec. pp. 605-607) There is no water official to be watched because none come more than three or four times in a season, and then, only to make observations.

The fact that Mr. Hinderlider does not recall in nine or ten years ever having received a complaint from an appropriator from the Cache la Poudre River with respect to the accuracy and efficiency of the devices installed for measuring water diverted from the Laramie River to the Cache la Poudre River, would not indicate anything favorable to the efficiency of this system, because all of the unrecorded water —more than 3,000 acre feet in 1926, as Mr. McAnelly stated to Mr. Freeman (Rec. p. 148)—would be made available for the use of these Cache la Poudre appropriators and they would only be interested in being protected from excess diversions in the Cache la Poudre over what the Record shows was diverted from the Laramie. The tranquillity prevailing among the appropriators from the Cache la Poudre River in Colorado relating to trans-mountain diversions from the Laramie to the Cache la Poudre, their source of supply, would seem to indicate they have no objection to the method, now shown to exist, being continued.

For the Defendant, Mr. Tipton and Mr. Patterson each admitted, as has been pointed out elsewhere in Complainant's brief, that there are no complete records, official or otherwise, showing the total diversions during the years 1926 to 1930, inclusive; nor for the years preceding those dates; but this, they state, is of minor importance, because the quantities for the missing period of time can be supplied by estimates. Mr. Patterson and Mr. Tipton contend they are able to supply missing data and, thereby, make the chart records for the years 1920 to 1931 and 1932 for the Skyline diversion, the Tunnel and Sand Creek, sufficiently accurate to form the basis of a computation to determine diverted quantities during those years in the aggregate and as to each year.

This, in reality, is support for Complainant's position. It is not a question of whether, by supplementing available data through the skill and experience of experts on the question of measuring and determining diversion flows of water, but what kind of records does Colorado make that Wyoming has to rely upon to determine the amount of

trans-mountain diversions in the absence of the assistance of experts who feel qualified from their experience to supply the omissions? And what amount is diverted when there is no record made or pretended to be made of those quantities which are diverted as foreign water from the Laramie River, unrecorded, to the Cache la Poudre River to the advantage of the appropriators from the Poudre River, depleting the available quantity required for Wyoming in the exact amount that is thus unlawfully taken from the Laramie River?

—VIII—

The Relative Rights to Divert and Take the Waters of Sand Creek and Natural Tributaries by Appropriators Claiming Appropriations Acquired Under the Laws of Wyoming and of Appropriators Claiming Appropriations Acquired Under the Laws of Colorado.

The relative rights of Wyoming and Colorado appropriators in the use of the waters of Sand Creek were not determined in the former case. (259 U. S. 419, 487; 66 L. Ed. 999, 1022) Sand Creek is an interstate stream, flowing from Colorado into Wyoming, but it is not, except nominally, a tributary of the Laramie River. (See 259 U. S. 489, 66 L. Ed. 1023) Independent of the use made of the channel of Sand Creek to carry water which the Defendant now diverts from the headwaters of Deadman Creek to the point where it is again diverted from the main channel of Sand Creek to Sheep Creek, Colorado has diverted and permitted to be diverted, practically the entire flow of Sand Creek and natural tributaries through that portion of the Wilson Supply Ditch identified as the "Divide Ditch." (Bill, § 15th, Rec. p. 44; Testimony of witness Widman, Rec. p. 142)

Prior to 1899, many water rights had been acquired under Wyoming territorial law by appropriators from Sand Creek, giving the right to divert and take stated quantities of the natural flow of Sand Creek for the purpose of irrigation and other beneficial uses. These rights have since been continually enjoyed and made use of by the appropriators and their successors to the extent that water was available,

and the evidence of those rights as they were acquired and as they exist today under Wyoming law, appears in Complainant's Exhibit No. 85 (Rec. pp. 1160-1200), where are found certified copies of certificates of appropriation of water evidencing the existence of these Wyoming water rights, which show the following:

Name of Appropriator	Name of Ditch	Source of Water Supply	Date of Appropriation	Amount of Appropriation cu. ft. per s.
Wyoming Central Land & Improvement Co.	Gullihur No. 2	Sand Creek	1871	2.8

(*Dry Creek, a tributary of Shell Creek)
(**Antelope Creek, a tributary of Sand Creek)
(***Running Water, a tributary of Sand Creek)

All these appropriations have dates of priority senior in time to June 15th, 1899, except that of John Goetz which has date of priority May 28th, 1900, and show a total of 86.85 cubic feet per second of time under Wyoming appropriations that are prior in time to any right in the Defendant, State of Colorado, under its appropriation with priority of June 15th, 1899.

As to the validity of these Wyoming and the Colorado water rights, the extent thereof, or the existence of the same relating only to Sand Creek and its natural tributaries, there is no controversy. It is conclusively shown that, notwithstanding the existence of the senior rights in Wyoming, Colorado has taken and permitted to be taken in Colorado by this junior appropriator with June 15th, 1899, priority, the entire available flow of Sand Creek above the point of diversion for the Wilson Supply Ditch. The result of this taking has been an almost continuous shortage of water for the Wyoming appropriators, first noticed immediately after the Divide section of the Wilson Supply Ditch had been placed in operation; and with the exception of one or two years when precipitation was considerably above normal, that shortage has been experienced. (Testimony of witness Lundquist, Rec. pp. 102-106)

No claim is made in the case at Bar by the State of Colorado to a right to divert and take, by reason of having made an appropriation of the waters of Sand Creek and its tributaries other than the right decreed to it by the Colorado court fixing the date of priority as June 15th, 1899, authorizing the appropriation under said decree, of the waters of Sand Creek for the Sand Creek Ditch System by construction. The decree of the Colorado court determining the appropriator's right to participate in the use of the waters of Sand Creek, does not authorize or justify the practice that has been pursued by the State of Colorado of taking all of the water that this stream furnishes above the point of diversion and diverting it to Sheep Creek for either storage for future use or for present irrigation.

There are many appropriators from Sand Creek and tributaries who have been injured by the action of the Divide Canal and Reservoir Company in diverting the waters of Sand Creek and tributaries. The diversions to the Cache la Poudre River from Sand Creek take away the water that would otherwise be available to prevent the shortages that

have occurred practically every year since the Divide Ditch has been in operation. The appropriators having water rights dependent upon the waters of Sand Creek and tributaries, as shown in Complainant's Exhibit No. 85 (Rec. pp. 1160-1200), have been deprived of water by the diversions from Sand Creek to Sheep Creek by the Divide Canal and Reservoir Company under its junior priority. (Testimony of witness Goetz, Rec. pp. 111-117; testimony of witness Cook, Rec. pp. 117-121)

—IX—

The Protection of Wyoming's Equity in the Use of the Waters of the Laramie River Requires that the Supervision of the Diversions in Colorado be Placed Under the Control of an Independent Agency.

The Colorado recognized appropriations have their diversion points within the territorial jurisdiction of that state. Except by consent of Colorado, Wyoming cannot visit these points of diversion, cannot make independent inspections of the automatic measuring devices installed for recording the water being diverted, and cannot exercise any jurisdiction or control over the measuring devices or over the diversion works. Complainant, recognizing this situation, attempted to gain the consent of Colorado to participate in making an inventory of the amount of water diverted under the recognized Colorado diversions from the Laramie River and called Colorado's attention to the desire of Wyoming to reach some amicable basis whereby Wyoming would be fully advised of the amount of the diversions being made and have some voice in superintending and controlling the same.

Wyoming's first endeavor was to enlist the cooperation of the United States Geological Survey as an independent agency to join with the representatives of Wyoming and Colorado when, on February 27th, 1928, Mr. Whiting, State Engineer of Wyoming, addressed a letter to Mr. Follansbee at Denver, Colorado, District Engineer of the United States Geological Survey. (See Record, page 205, where Mr. Whiting says he first took up this matter with Mr. Follansbee by letter of February 27th, 1928.) This letter is marked "Complainant's Exhibit No. 20," and appears at page 991 of the Record. Mr. Follansbee, as District Engineer of the

United States Geological Survey, answered Mr. Whiting's letter and the answer appears as Complainant's Exhibit No. 21, at page 991 of the Record.

On March 8th, 1928, Mr. Whiting addressed a letter to Mr. M. C. Hinderlider, State Engineer of Colorado, which letter appears in the Record at page 992 as Complainant's Exhibit No. 22, wherein Mr. Hinderlider's attention is called to the fact that Wyoming is of the opinion that excess quantities of water are being diverted and taken by Colorado from the Laramie River to the Cache la Poudre River and Mr. Whiting requests Colorado's friendly cooperation to make an inventory of these diverted quantities, free of expense to Colorado. An answer by Mr. Hinderlider to Complainant's Exhibit No. 22 appears as Complainant's Exhibit No. 23 (Rec. p. 994A) which acknowledges that Mr. Whiting's request has been received and that the proposition will be presented to the owners of the ditches diverting water from the Laramie River in Colorado.

On March 31st, 1928, Mr. Whiting addressed further detailed information to Mr. Hinderlider, endeavoring to explain the purpose of desiring the survey to be made of diversions from the Laramie River to the Cache la Poudre River, and this communication appears as Complainant's Exhibit No. 24. (Rec. pp. 995, 996) Mr. Hinderlider replied on April 2nd, 1928, (Complainant's Exhibit No. 25, Rec. p. 996A) to Mr. Whiting's letter (Complainant's Exhibit No. 24) advising that it would be necessary to secure the cooperation of the Colorado ditch interests, because to make the survey, it would be necessary to enter upon private property and he suggested that Mr. Whiting assume the burden of contacting the Colorado ditch interests.

Further pursuing his efforts to arrange for the inventory of the Laramie River diverted water, Mr. Whiting addressed a letter (Complainant's Exhibit No. 26, Rec. pp. 997, 998) to Mr. Hinderlider and, also, sent a letter (Complainant's Exhibit No. 27, Rec. p. 998) to Mr. Follansbee. Wyoming, being unable to make progress for a friendly inventory and survey of the diversions from the Laramie River, on May 20th, 1929, addressed her Exhibit No. 29 (Rec. p. 999) to the State of Colorado, stating what in her judgment should be the limit of diversions from the Laramie River to the Cache la Poudre River and what information Wyoming should receive regarding diversions, with a right of inspec-

tion of the automatic gauge chart meter measurements and related records of Colorado's trans-mountain diversions, and the installation of a rating flume and automatic gauge on Deadman Feeder or Wilson Supply Ditch. On April 5th, 1928, Mr. Hinderlider replied to Mr. Whiting's letter of April 3rd, the reply being Complainant's Exhibit No. 30 (Rec. pp. 1000A, 1000B), and the request of Wyoming to make an independent or original inventory and appraisement of diversions or to have anything more than permission to inspect the records made under Colorado's exclusive supervision, was, in effect, denied.

Thereafter, on June 21st, 1930, the State of Wyoming addressed her Exhibit No. 32 (Rec. pp. 1001-1004), to officials of the State of Colorado, wherein she called Colorado's attention specifically to conditions prevailing with relation to diversions from the Laramie River to the Poudre River, stated her construction of the rights of Colorado under the decree entered in the suit formerly tried between these two states relating to the rights of each state to enjoy the use of the waters of this interstate stream, and requested that Colorado conform to the limits of the decree. Colorado, on August 14th, 1930, sent to Wyoming, in reply to her Exhibit No. 32, a letter (Complainant's Exhibit No. 33, Rec. p. 1004A), wherein she advised that she had been unable to find that Colorado or her citizens have violated the decree by diversions through the Tunnel in excess of the amount allowed or by aggregate annual diversions by Colorado users in excess of the total amount mentioned in the decree.

The testimony of Mr. Whiting for Wyoming accompanying these exhibits in connection with his efforts to arrange for measurements of Laramie River trans-mountain diversions, appears in the Record at pages 205 to 218, inclusive. After Mr. Whiting was advised that Colorado would not consent to the proposal he had made to make this joint study (Rec. p. 212), Wyoming continued her efforts to bring about an amicable determination of the question with Colorado. (Rec. pp. 212, 213) Failing to make any progress, Wyoming employed engineers to proceed, under the direction of State Engineer Whiting, with an independent observation and study of the trans-mountain diversions and an inspection of the measuring devices installed. As a result of this investigation, Wyoming concluded that the Colorado trans-mountain diversions were taking water in excess of

the amount authorized by the decree of the United States Supreme Court. (Rec. p. 216) These conclusions were immediately stated in writing and brought to the attention of the officials of the State of Colorado. (Complainant's Exhibit No. 32, Rec. pp. 1001-1004)

The effort to bring about the solution of the controversy was continued by a conference held in Greeley, Colorado, about September 26th, 1930, but no progress was made at this conference and this was the last attempt by Wyoming officials to obtain the cooperation of Colorado in determining the diversions of water being made from the Laramie River to the Cache la Poudre River. (Rec. pp. 218, 219)

The evidence shows clearly Wyoming's efforts, over a period of more than two years, to avoid the necessity of having the question of the amount of water authorized to be diverted by Colorado from the Laramie River under the former decree, brought to the attention of this Honorable Court. She employed every means available to influence Colorado to cooperate with her and the United States Geological Survey, as a third and independent agency, to determine these questions amicably and promptly between the two states, and her efforts were in vain. Wyoming was compelled to bring this suit to protect her rights.

Mr. Hinderlider testified that he considers that the quantity of water allocated to Colorado is to be measured by mass allocation, consisting of the aggregate amount of 18,000 acre feet for the Skyline Ditch, 15,500 acre feet for the Laramie-Poudre Tunnel, and 4,250 acre feet for the meadow rights, making a total of 37,750 acre feet, exclusive of the unknown quantity for the Wilson Supply Ditch (Rec. p. 410); that he has always considered, as an administrative officer, that, under the decree, the 4,250 acre feet allotment for the meadow rights should be measured as a consumptive use, not actual headgate measurement (Rec. p. 411); and at page 412 of the Record, that the Supreme Court decision authorized diversions in larger amounts than 4,250 acre feet, because a portion of the diverted water would return to the stream and that the stream would not, by reason of these larger diversion quantities, be depleted beyond 4,250 acre feet; that he has always construed the words in the decree, "divert and take," to mean "to consume," so far as its effect upon Wyoming is concerned (Rec. p. 411); that, notwithstanding the decree originally rendered and the later

opinion construing the decree, he still is of the opinion that Colorado is authorized to make a mass diversion, so long as 37,750 acre feet are not exceeded as a total and that Colorado could permit as many diversions from the Laramie River watershed as she desires (Rec. pp. 412, 413); that he has read the decree of June 5th, 1922, the modified decree of October 9th, 1922, and the opinion of May 31st, 1932; that he is not yet able to determine what the rights of Colorado are with reference to whether the diversions are limited to specific quantities for recognized appropriations or whether a mass allocation of water was awarded to Colorado that might be diverted from any source and by any means which Colorado chose to recognize. (Rec. pp. 815, 816)

Mr. Hinderlider further says the Attorney General advised him that it was his opinion that a mass allocation of water was awarded to Colorado and that the Bob Creek Ditch and the Columbine Ditch would be entitled to divert water under the decree (Rec. p. 816), but that as a matter of precaution pending the final disposition of this case, he requested the Bob Creek and Columbine Ditches to discontinue diversions (Rec. p. 816); that in his judgment, the Skyline Ditch is not limited to 18,000 acre feet in a year and that if the courts of Colorado should recognize the right of any additional canal to divert water through the Laramie-Poudre Tunnel, he would have no authority to object (Rec. p. 819); that for the purpose of collecting water and diverting it from the Laramie River to the Poudre River, Colorado might authorize the extension of any diversion works to tap any new source of supply and divert the water thus captured, without violating the United States Supreme Court decree, so long as the total Tunnel diversions did not exceed 15,500 acre feet; that he only recognizes the Laramie-Poudre Tunnel as the agency of the State of Colorado which is definitely limited to 15,500 acre feet; that it would be legal to construct in the future, a ditch to tap Deadman by means of what has been referred to as the East Side Collection Ditch and other creeks, diverting and delivering water to the mouth of the Tunnel, so long as the diverted quantity was not in excess of 15,500 acre feet (Rec. pp. 819, 820); that under the United States Supreme Court decree of June 5th, 1922, in his belief, future diversions or extensions of existing works could be made to tap any source of water originating in the Laramie River Basin in Colorado, so long

as the total amount of water diverted did not exceed 37,750 acre feet (Rec. p. 820), but he does recognize that the appropriation recognized by the United States Supreme Court decree for the Greeley-Poudre Tunnel is limited under the laws of the State of Colorado to the use of the works heretofore initiated for diverting from the west branch of the Laramie River and tributaries and east branch of the Laramie River and tributaries (Rec. p. 820); that the Tunnel would be limited in its diversions to the sources of diversion and supply named in the adjudication proceedings under the laws of the State of Colorado.

Mr. R. J. Tipton, an official of the Defendant, State of Colorado, is, also, unable to understand the limitations placed upon the right of Colorado to divert and take water from the Laramie River under the decree of June 5th, 1922. (Rec. pp. 861-865) This witness says:

> "In my opinion if the Supreme Court Decree of 1922 in the case of Wyoming vs. Colorado is interpreted to mean that the Skyline Ditch is limited to 18,000 acre feet diversion in any one year, the effect would be to tend to deprive the owners of the Skyline Ditch of some water that they enjoyed the use of prior to the filing of the former Wyoming vs. Colorado suit." (Rec. p. 861)

Mr. C. L. Patterson, another Colorado witness, testified (Rec. pp. 728-733) that he could not understand from the language used in the decree defining the relative rights of Colorado and Wyoming to the use of the waters of the Laramie River, that there was any specific limitation placed upon the amount that might be diverted through any single diversion, whether recognized or not, except that 15,500 acre feet would be the limit for the Laramie-Poudre Tunnel in any one year; that the Skyline Ditch should be permitted to divert with a limit only in accordance with the amount of water appropriated for it and recognized by the laws of the State of Colorado; that the meadow land diversions should not be measured headgate quantities, but should be controlled by the amount consumed; and Mr. Patterson further says (Rec. pp. 728-734) that if he was administering the decree, he would do it in exactly the way he has explained it in his testimony and if that method did not satisfy Wyoming, it would be necessary to come back to court, because the basis

is not understandable but that all of this controversy could be eliminated if the court would accurately state, in terms of engineering practice, what it intends the decision to cover. (Rec. p. 734)

Mr. Fred A. Harrison, a witness for Colorado who had served as Assistant Attorney General, was called to testify as to his understanding of Colorado's rights under the decree and his testimony is shown at pages 419 and 420 of the Record.

The Record discloses that an attorney general, an assistant attorney general, a state engineer, and two other engineers, have all testified in this case after May 31st, 1932, when the opinion of the United States Supreme Court was delivered clearly defining the relations of Wyoming to Colorado in the use of the waters of the Laramie River, that in their opinion, Colorado is still entitled to continue the practice and method that Wyoming had complained of and that was recognized and approved by Colorado prior to the time this suit was started and subsequent to the time the decree of June 5th, 1922, was rendered. Mr. Hinderlider, as State Engineer of Colorado, states that until further advised, he feels it within his rights to control diversions of water in Colorado, permitting the Bob Creek Ditch and the Columbine Ditch to divert water under his interpretation of the Supreme Court decree. (Rec. p. 818)

CONCLUSION

Complainant submits that she is entitled, upon the facts established and as shown by the Record:

1. To have the measurement and recording of water lawfully diverted from the Laramie River to the Cache la Poudre River placed under the authority of the United States Geological Survey or such other independent agency as shall be designated by this Court.

2. That the State of Colorado be ordered to install, at the location determined by competent authority to be the most favorably situated for the accurate measurement of water diverted through the Laramie-Poudre Tunnel, a standard measuring device capable of accurately recording and measuring the diverted quantities of water.

3. That the State of Colorado be enjoined from diverting or permitting the diversion or taking of water from the Laramie River watershed in Colorado, except to satisfy those appropriations which were specifically recognized as being entitled to divert stated quantities of water under the former decree, namely,

(a) Not to exceed 18,000 acre feet annually under the Skyline Ditch appropriation;

(b) Not to exceed 4,250 acre feet annually, headgate measurement, for the irrigation of meadow lands located in the valley of the Laramie River in Colorado;

(c) Not to exceed 15,500 acre feet annually, under the Laramie-Poudre Tunnel appropriation through the Laramie-Poudre Tunnel.

4. That the State of Colorado be enjoined from diverting or permitting the diversion or taking of any water from the headwaters of Deadman Creek.

5. That the State of Colorado be enjoined from diverting or permitting the diversion or taking of any water from Bob Creek and its tributaries, Columbine Creek and its tributaries, Rawah Creek and its tributaries, and Lost Lake System.

6. That the State of Wyoming be decreed the right to go upon the premises in Colorado where the diversions of water are authorized to be made from the Laramie River and make such reasonable inspections and observations as her officials may desire, and be furnished with all records showing diversions made to satisfy recognized Colorado appropriations.

7. That the State of Wyoming recover her costs herein expended and have such other and further equitable relief as to the Court may appear proper in the premises.

Respectfully submitted,

RAY E. LEE,
Attorney General of the State of Wyoming,

JAMES A. GREENWOOD,
Special Counsel for the State of Wyoming,
Cheyenne, Wyoming,
ATTORNEYS FOR COMPLAINANT.

THOMAS F. SHEA,
Deputy Attorney General of Wyoming,

WILLIAM C. SNOW,
Assistant Attorney General of Wyoming,
OF COUNSEL.

STATEMENT		1
GENERAL STATEMENT OF THE ISSUES		2
(a)	The Bill here is to enforce decree which determined relative rights of each of the States	4
(b)	Thus two issues are before the Court	9
(c)	Issues are not between individual appropriators but between States	10
(d)	The acts complained of are not sufficiently serious to invoke the extraordinary power of this Court	16
PROPOSITIONS OF LAW		17
I.	This is an action between two States appearing as *parens patriae*	17
II.	The governing rule is that this Court will not exert its extraordinary power against a State unless a threatened invasion of rights is of serious magnitude and clearly established	18
III.	The Colorado official charged with keeping the record of diversions from Laramie River is the Commissioner of Water District No. 3	18
IV.	The Wilson Supply Ditch appropriation was determined by modified decree of this Court on Oct. 9, 1922	18
V.	Doctrine of Relation	19
VI.	The decree in adjudication of water rights determines the date of priority	19
VII.	In 1907 land and water rights in Wyoming were severable	19
VIII.	Conditional decrees of priorities recognized under laws of Colorado	20
IX.	The law with respect to reasonable diligence in water adjudications	20
X.	The legal effect of delay in completing works due to pendency of former suit	20

PAGE

SUMMARY OF THE ARGUMENT 20-22

ARGUMENT 23

I. Colorado has always been willing to cooperate with officials of Wyoming in efforts reasonably designed to reassure Wyoming authorities as to quantity of water diverted.... 23

II. Colorado's measuring devices on trans-mountain ditches are standard and records are reasonably sufficient for determining the quantities of such diversions 31

III. Colorado's diversions annually since the entry of former decree have been within the 33,500 acre feet allocated for trans-mountain ditches, except for a small excess in 1929..... 43

IV. Colorado has not consumptively used for both trans-mountain and meadow land uses in excess of 37,750 acre feet for either of the years alleged in the bill, except a small excess in 1929 48

V. (A) Laramie-Poudre Project comprises the Tunnel and West Side Collection Ditch 58

1. The Laramie-Poudre Tunnel appropriation comprises a system of collection ditches of which the tunnel is the conduit to the Poudre and is one project..... 60
2. Rawah Creek and other tributaries of the Laramie are part of tunnel project 61
3. The decree and water adjudication of Laramie-Poudre 66
4. Tunnel and collection ditches together form the tunnel project 68
5. Evidence does not show lapse of tunnel appropriation 72
6. Authorities supporting decree of Laramie-Poudre Tunnel System..... 83

PAGE

(B) Laramie-Poudre Tunnel diversion for 1926 did not exceed decree 84
1. Wyoming's testimony does not show excessive unrecorded flows 86
2. Analysis of testimony respecting Colorado's registering devices and records.... 89
3. Variation in reported and actual volume diverted by tunnel in 1926 did not injure Wyoming 93
(C) Laramie-Poudre Tunnel weir is standard equipment 98
1. The proper place for measuring diversions from the Laramie was Water District No. 3 102
2. Wyoming's representatives have had full access to tunnel measuring devices and records 104
3. Colorado appropriators do not understate their diversions 106
VI. The meadow land diversions 109
VII. The Skyline Ditch appropriation..... 117
VIII. Bob Creek Ditch, Columbine Ditch and Lost Lake System 125
IX. The Wilson Supply Ditch 134
1. History Wilson Supply Ditch System..... 134
2. Adjudication of appropriation for Wilson Supply Ditch 140
3. No enlargement of Wilson Supply Ditch since first constructed 143
4. Rights of Wilson Supply Ditch determined by modified decree of October 9, 1922..... 148
5. The Doctrine of Relation 156
X. Wilson Supply Ditch has not deprived meadow ditches on Sand Creek in Wyoming of water 159
XI. Decrease in annual stream flow on Laramie River due to natural conditions 173
CONCLUSION 177

In the

Supreme Court of the United States

October Term, 1935

No. 10, Original
IN EQUITY

THE STATE OF WYOMING,
Complainant,

vs.

THE STATE OF COLORADO,
Defendant.

DEFENDANT'S BRIEF AND ARGUMENT.

STATEMENT.

The State of Wyoming filed her Bill of Complaint herein on October 6, 1930, as set forth in the Record, pages 4-20.

To said Bill, the State of Colorado, on April 6, 1931, filed her motion to dismiss, in the nature of a demurrer, which was heard by the Court, and was denied on May 31, 1932. The opinion of the Court ruling on said motion is reported in 286 U. S. 494; 76 L. Ed. 1245.

Thereafter and on June 30, 1932, Wyoming filed her amended Bill of Complaint (R. 32-50), and on September 15, 1932, Colorado filed her answer to the amended Bill (R. 31-70), which answer denied generally any violation of the decree of the Court entered June 5, 1922 (259 U. S. 419), as modified October 9, 1922 (260 U. S. 1), and presented new matter justifying her conduct with respect to her diversion and use of the waters of the Laramie River, following the date of the said decree. To the answer, the complainant filed replication on October 31, 1932 (R. 71-79).

On the issues joined, evidence was taken before Commissioners of this Court, commencing on April 17, 1933, and concluding on July 6, 1933.

A general statement of the issues follows, and particular statements with reference to the several diversions involved will be set forth in the subdivisions of this brief relating to each.

General Statement of the Issues.

Character of present proceedings, and decisive issues. The issues here were defined at the outset by the Court's opinion of May 31, 1932, upon defendant's motion to dismiss the bill of complaint. The motion had raised the objections of: (1) lack of Colorado appropriators as parties, and (2) questioned whether there had been previously determined the full quantity of water which rightfully may be diverted from the Laramie River in Colorado, and likewise the quantity which Wyoming and her water users are entitled to receive and use from the stream within that State; and (3) that, in any event, the bill fails to show with certainty any violation of the decree or any damage to Wyoming or her water users.

The Court's opinion (286 U. S. 494), so at the outset, defined the issues and clarified them:

"This is a suit brought by the State of Wyoming against the State of Colorado (1) to enforce a decree of this Court (259 U. S. 419, 260 U. S. 1) rendered in an earlier suit between the same States respecting their relative rights to divert and use for irrigation the waters of the Laramie River, a stream rising in Colorado and flowing northward into Wyoming.

In the present bill, shortly described, Wyoming alleges that Colorado is departing from that decree by permitting (1) diversion and use within her territory of waters of the Laramie in quantities (a) *largely* in *excess* of those *accorded to her by* the *decree;* that these excessive diversions are (b) *preventing Wyoming* from receiving and using the *amount* of water which the decree *accorded to her,* (2) that Colorado, unless restrained by this Court, *will* continue to *permit* such *excessive* diversions and thereby will (3) *largely* or entirely *deprive Wyoming* of the use of the water *accorded* to her *in* the *decree;* that the measuring devices installed by Colorado to measure the waters diverted within her territory (1) do not accurately show the *full quantities* so diverted; and that (2) Colorado refuses, although duly requested, to (3) permit Wyoming to install *other suitable devices* or *participate* in the *measurements.*"

We have above by italics, numerals, and parentheses, pointed out for later discussion what seem the essential allegations to be examined.

The motion to dismiss was overruled, leave was given the State of Wyoming to amend by making more definite, which she did. The State of Colorado answered, denying violation of the decree, declaring desire to observe it and willingness to have Wyoming participate in measurements in Colorado.

The decree here alleged to have been violated and sought to be enforced was in a suit, in which, in addition to the State of Colorado, there were made defendants the Greeley Poudre Irrigation District, for whom it was being constructed, and The Laramie-Poudre Reservoirs and Irrigation Company which was constructing, the Laramie-Poudre tunnel project, a system of works at the high altitudes on the Laramie River in Colorado to collect waters from the Laramie and its tributaries, carry them to the tunnel from the Laramie into the Poudre and then through, and to redivert them from the Poudre for irrigation of lands in the District.

The decree "enjoined from diverting or taking from the Laramie River and its tributaries in the State of Colorado more than 15,500 acre feet of water per annum in virtue of or through what is designated in the pleadings and evidence as the Laramie-Poudre tunnel appropriation in that State" and continued therein, and by modified decree of October 9, 1922, 260 U. S. 1, to provide recognition also of certain other appropriations.

(a) THE BILL HERE IS TO ENFORCE A DECREE WHICH DETERMINED THE RELATIVE RIGHTS OF EACH OF THE STATES IN THE WATERS OF THE LARAMIE RIVER.

In her brief filed herein in opposition to motion to dismiss, the complainant, in the opening paragraph, stated the object of the suit as follows:

> "The bill seeks to prevent violations of the decree entered October 9, 1922, reported in Vol. 259, U. S. Rep., page 419, and Vol. 260, U. S. Rep., page 1."

And, on page 2, amplified this:

> "To bring clearly before the Court the only question involved in the case at Bar, complainant states that it is the contention of the complainant

that in the decree entered in the case of Wyoming v. Colorado, 259 U. S. Rep. page 419, 260 U. S. Rep. page 1, the Court determined the available annual water supply for diversion and use to satisfy the demands of the various appropriators and users of water from the Laramie River and tributaries within the States of Colorado and Wyoming, and determined the relative rights of each of said states in the use of the waters of said Laramie River and tributaries."

On page 7 of that brief, Wyoming again stated:

"The subject matter of this suit is the enforcement of the decree as rendered in the former Wyoming-Colorado case, supra, which determined the relative rights of the States of Wyoming and Colorado in the use of the waters of the Laramie River, an interstate stream, and its tributaries."

To abstract the ruling thereon and the essential allegations of the present bill the language of the Court in that opinion interpreting that decree, on the motion to dismiss seems most concise: 286 U. S. 494, 507; 76 L. Ed. 1245, 1251. The Court said:

"As before shown, the modified decree (1) restricts diversion under the Colorado tunnel appropriation to 15,500 acre feet, the amount which under the findings would remain in the supply after deducting the quantities included in the senior appropriations in both States; (2) recognizes and protects the Skyline appropriation of 18,000 acre feet, it being a senior Colorado appropriation; (3) similarly sustains the meadowland appropriations of 4,250 acre feet, they being senior Colorado appropriations; (4) recognizes and protects the small Wilson Supply ditch appropriation made prior to 1902, it being a senior Colorado appropriation in-

advertently omitted from the list in the opinion but given its proper place by a modification of the original decree; and (5) saves from prejudice all appropriations of the waters of Sand Creek, found not to be a tributary of the Laramie.

"The decree enjoins any diversion through the tunnel appropriation in excess of the 15,500 acre feet accorded to it—and this doubtless for the reason that there had been a declared and real purpose to divert from 56,000 to 71,000 acre feet under that appropriation. No showing appears to have been made indicative of any occasion at that time for a broader injunction. Of course, in the absence of such showing, a broader injunction was not justified. Certainly the limited injunction which was granted does not warrant any inference that it marks the limits of what was intended to be decided. Such an inference would be inconsistent with other parts of the decree and with the opinion and the findings therein.

"Construing the decree in the light of the record and opinion, to which counsel for both States appeal, we think it was intended to and does define and limit the quantity of water which Colorado and her appropriators may divert from the interstate stream and its tributaries and thus withhold from Wyoming and her appropriators.

"But it is said that water claims other than the tunnel appropriation could not be, and were not, affected by the decree, because the claimants were not parties to the suit or represented therein. In this the nature of the suit is misconceived. It was one between States, each acting as a quasi-sovereign and representative of the interest and rights of her people in a controversy with the other. Counsel for Colorado insisted in their brief in that

suit that the controversy was 'not between private parties' but 'between the two sovereignties of Wyoming and Colorado' and this Court in its opinion assented to that view, but observed that the controversy was one of immediate and deep concern to both States and that the interests of each were indissolubly linked with those of her appropriators. 259 U. S. 468. Decisions in other cases also warrant the conclusion that the water claimants in Colorado, and those in Wyoming, were represented by their respective States and are bound by the decree.

"The contention that the present bill shows that the acts complained of are not acts done by Colorado, or under her authority, but acts done by private corporations and individuals not parties to the present suit, is shown by the bill to be untenable. It is there alleged that Colorado in 1926 permitted a diversion from the Laramie through the Laramie-Poudre tunnel appropriation materially in excess of the 15,500 acre feet specified in the decree; that in 1926, 1927 and 1928, with the knowledge, permission and cooperation of Colorado, diversions were made from the Laramie and its tributaries through the Skyline ditch appropriation in stated amounts materially in excess of the 18,000 acre feet specified in the decree; that in 1926, 1927, 1928 and 1929, with the knowledge, consent and cooperation of Colorado, diversions were made from the Laramie and its tributaries through the meadowland appropriations in various amounts pronouncedly in excess of the 4,250 acre feet specified in the decree; and that Colorado has permitted other diversions from the Laramie and its tributaries in violation of the decree through the Bob Creek and other designated ditches, none of which were recognized or named in the findings or decree."

The Court thereupon held adversely to the argument of Colorado's motion that water claims other than the tunnel appropriation were not affected by the decree because the claimants were not parties to the suit. They "were represented by their respective States and are bound by the decree."

> "Plainly there is enough in the bill to require that the defendant be called upon to answer it."

Colorado answered in detail the allegations of the amended bill of complaint. Its position generally is epitomized in R. 53-69.

The admissions of the defendant: The answer of Colorado admits certain of the allegations of the amended bill, as set forth in the Wyoming brief, pp. 7 and 8. These admissions, however, are of the allegations of the amended bill as to what was found by the Court, and are to be taken in connection with the context of the Court's opinion and decree as to the basis of arriving at the 288,000 acre feet total available water supply of the Laramie in both States, i. e., that the recognized diversions of the Skyline Ditch, Meadow Land Ditches, and of the Wilson Supply ditch from Deadman Creek were always to be recognized, and were always taken out, in arriving at the 272,500 acre feet available supply basis for Wyoming.

Broadly stated, Colorado denies a withholding or depletion of the Laramie River beyond her decreed apportionment of it.

As to administration and measurement, Colorado responds that vigilant administration is made, both by the State Officials and by the appropriators, of diversion and measurement, to record fully within practical limits, by improved standard weirs, comformable to practices in like localities in Wyoming and by recording instruments fairly accurate, all water withheld from Wyoming and consumed

in Colorado. Further, that the measuring has always been open to Wyoming, that she has not been refused, but through her agents at all times has had free access to, all measuring weirs and to the records of the State Engineering Department of Colorado which is the water administrative agency of this State. Offer to Wyoming of continued access to make its own measurements and to check upon the measurements and measuring devices of the State of Colorado is made.

The answer does not stop with mere denials, but delineates her position with detailed explanation of its works complained of in the Amended Bill of Complaint, discloses its diversions, and other facts and explanations to disavow that Colorado has diverted, or intends to divert, either largely in excess, or in excess at all, of the amount permitted to be withheld by it, and proffers cooperative measurements and exchange of records of diversions. (R. 51-70.)

(b) THUS TWO ISSUES ARE BEFORE THE COURT:

1. Has Colorado largely exceeded what the Court there decreed "The quantity of water which Colorado and her appropriators may divert from the interstate stream and its tributaries *and thus withhold* from Wyoming and her appropriators."? 286 U. S. 494, 507; 76 L. Ed. 1245, 1251. The gist of it is *withholding* from Wyoming.

2. Is the water administration of the Laramie River in and by the State of Colorado, as to the measurement of such quantities, not reasonably accurate, so that the United States Government should intercede now and take it over?

The waters of this interstate stream have been apportioned. They are derived from both States. Both States have rights in the river. They are recognized and defined

by that decree. Has Wyoming been deprived of her rights there accorded in the interstate stream, by acts of Colorado which withheld quantities materially in excess of that apportioned share which Colorado may withhold?

Wyoming, on page 2 of its brief, at the outset declares its position that the ruling of the Court on defendant's motion to dismiss (286 U. S. 494, 506; 76 L. Ed. 1245, 1251) has settled the question of construction of the decree in the former case, leaving for determination the question, "Has the State of Colorado violated the decree?" So narrowed, we take it that if the proof does not show Colorado has violated the decree, then the second issue above stated, receivership in effect, will not here require action by the Court. Since Wyoming has however gone on to argue matters of construction of that decree we shall here answer such argument with the views of the State of Colorado thereon.

(c) THE ISSUES HERE INVOLVED ARE NOT BETWEEN INDIVIDUAL APPROPRIATORS ON OPPOSITE SIDES OF THE STATE LINE BUT IT IS A CONTROVERSY BETWEEN TWO QUASI-SOVEREIGN STATES APPEARING AS PARENS PATRIAE.

What was intended to be decided and was decided by that decree was "the quantity of water which Colorado and her appropriators may divert from the interstate stream and its tributaries and thus withhold from Wyoming and her appropriators." (Wyoming v. Colorado, 286 U. S. 494, 508.)

It did not decide what were the relative rights, as between the claimants in each state among each other within the same state, what were their respective individual priorities or rights. That is a matter of local law and judicial determination among them through the State Courts and administrative agencies. It is a well settled rule of the Supreme Court of the United States that when-

ever the federal power is exerted within what would otherwise be the domain of the State power, the justification of the exercise of the federal power must clearly appear.

The United States Supreme Court in this original case decided only the rights between the whole of the appropriators of each State as against the whole of the appropriators in the other State. It so found, and held that, after prior appropriations in Colorado and in Wyoming were satisfied there were 15,500 acre feet available for the Colorado Laramie Tunnel appropriation which the Court dated from late October, 1909.

That the Laramie-Poudre appropriator and none other in Colorado was made a party to that suit confirms its aspect as solely one between states whose decree decided rights and apportionment of water solely between states, not between individuals. Even the Greeley Poudre or Laramie-Poudre interest, there made a party, had no right to litigate in its own behalf, as against other Colorado appropriators, the merits of the controversy. Certainly those other Colorado appropriators, eighty or more, not made parties could not there litigate and have their rights determined as between each other.

> "The fact that an individual citizen in such a case is made a party defendant in order that the complainant may obtain some particular relief against him, which is merely incidental to the complete relief to which the complainant would be entitled if it should prevail as against the defendant state, gives such an individual defendant no standing to litigate on his own behalf the merits of a controversy which, properly viewed, lies solely between the states but only to contest the propriety of the particular relief sought against him in case the decision on the merits is against his state. This gives an individual defendant in such a suit between

states full opportunity to litigate the only question which concerns him individually as distinguished from the questions which concern him only in common with all the citizens of his state." Kentucky v. Indiana, 281 U. S. 163, 175; 74 L. Ed. 797.

From the foregoing, it is seen that the position of the complainant in the outset has been, as is also that of the Colorado water officials, that the decree was determinative of the relative rights of each of the States in the water of the Laramie River and tributaries. The United States Supreme Court did not attempt to determine in such a suit the rights of different individual appropriators between each other.

We again quote from the brief of the State of Wyoming in opposition to motion to dismiss (p. 41):

> "The single question presented to this Honorable Court is whether Colorado's relative right to the use of the waters of the Laramie River is limited to 37,750 acre-feet per annum, or is the only limitation on Colorado, the 15,500 acre-feet annually, allowed for the tunnel."

And, from page 42 thereof, showing that Wyoming's position in this suit, as heretofore taken, is that the decree of October, 1922, was a mass allocation of the water between the two states:

> "On the contrary, Wyoming in this proceeding rests her claim for relief solely upon the contention that the allocated portion of the water to which citizens or corporations, diverting water under the laws of Colorado and under her supervision and with her consent, are limited to the aggregate amount which this Court in said former Wyoming-Colorado decree found as her relative right or equitable interest in the use of the waters of that

stream, to be the amount of 37,750 acre-feet annually, and that Colorado, through her officials charged with the administration of the diversion and use of the water of the Laramie River, in Colorado, is ignoring the decree of this Honorable Court which determined the said relative rights of the complainant and defendant in the use of the waters of this interstate stream."

The citizens of each State are concluded by the decree between the States. This Court said in Wyoming v. Colorado, 286 U. S. 507:

> "The decree must be taken as determining the relative rights of the two States including their respective citizens to divert and use the waters of the Laramie and its tributaries." * * *
>
> "It was one between States, each acting as a quasi-sovereign and representative of the interests and rights of her people in a controversy with the other." * * *
>
> "Decisions in other cases also warrant the conclusion that the water claimants in Colorado, and those in Wyoming, were represented by their respective States and are bound by the decree."

We quote the above summations of decision and exposition of the decretal effect of that decision for the reason it was sought and brought forth by means of the motion of Colorado to dismiss the bill and thus furnished the guide to relevancy on trial of the issues here raised, i. e., whether the rights of Wyoming and her citizens have been invaded or are threatened to be invaded in depletion of the river by water withheld in Colorado.

But while the decree between the States is held binding upon all claiming rights within and under the States, we do not take it the decree holds that the rights of

each citizen and appropriator within each State were litigated as between each other in that former suit. In it must have been involved several hundreds of citizens, claimants or owners of Laramie River water rights in each of the States of Colorado and Wyoming, adversely interested among themselves in each State as appropriators in the several diversions theretofore initiated. The States were made the litigants rather as representatives of the aggregate of the rights of their citizens and appropriators, of the one State against the aggregate of the other State, rather than as each separate State pursuing the separate claims of each citizen against the separate citizens or appropriators of the other State.

> "The right of a state as *parens patriae* to bring suit to protect the general comfort, health or property rights of its inhabitants, threatened by the proposed or continued action of another state, by prayer for injunction, is to be differentiated from its lost power as a sovereign to present and enforce individual claims of its citizens as their trustee against a sister state."—North Dakota v. Minnesota, 263 U. S. 365, 375; 68 L. Ed. 342.

The Court took occasion to point out in Conn. v. Mass. in reviewing the basis of decision in apportionment of water in suits between States to say, in Conn. v. Mass., 282 U. S., page 660 at p. 670, 75 L. Ed. 602:

> "For the decision of suits between states, federal, state and international law is considered and applied by this Court as the exigencies of the particular case may require. The determination of the relative rights of contending states in respect of the use of streams flowing through them does not depend upon the same considerations and is not governed by the same rules of law that are applied in such states for the solution of similar questions

of private right. Kansas v. Colorado, 185 U. S. 125, 146; 46 L. Ed. 838, 846. And, while the municipal law relating to like questions between individuals is to be taken into account, it is not to be deemed to have controlling weight.

"As was shown in Kansas v. Colorado, 206 U. S. 46, 100; 51 L. Ed. 956, 975, such disputes are to be settled on the basis of equality of right."

The appropriators derive their rights to the water under their respective States. As between the States the United States Supreme Court has jurisdiction to apportion the water of this river because it is an interstate river. But as within the States themselves, each State is free to change its method of apportioning its water.

The determination of the interests in the water between the citizens of the State, whether upon a riparian basis or an appropriation basis, is for the local Courts of the several States. In the appropriation States there is a contest or rivalry between the various claimants as intending appropriators as to what shall be the dates of their priorities and what portion each shall be allowed to divert. That is a matter for the State tribunal that is within each State. As between the States, the Supreme Court has jurisdiction to determine what shall be the apportionment to each State. All the citizens of each State are bound by that apportionment, but as among themselves they may still litigate as to relative priorities, with respect to the determination of the titles of the separate citizens in that moiety of the water accorded the respective States. The governing rule is that the Supreme Court will not exercise its extraordinary power to control the conduct of the State unless the threatened invasion of rights of the other State is of serious magnitude and established by clear and convincing evidence.

As above pointed out in the quotation from 286 U. S. 494, 508, what was intended to be decided and was decided was the quantity of water which Colorado may withhold from Wyoming. To arrive at the quantity available for the appropriation then being prosecuted in Colorado by the Laramie-Poudre diversion, it was necessary to determine what amount of water was equitably to be apportioned to Wyoming and what amount of water was equitably to be apportioned to Colorado. In arriving at this, the Court determined what was the total dependable supply, 288,000 acre feet, after recognized earlier appropriations in Colorado had been supplied, and what appropriations in Wyoming were prior to the intending appropriator in Colorado, to-wit, 272-500 acre feet. This made 37,750 acre feet which was to be withheld by prior appropriations in Colorado through the Skyline and the Meadows, and including 15,500 acre feet available for the appropriation of Colorado, sought to be entirely enjoined, the Laramie-Poudre tunnel appropriation. This was exclusive of and in addition to the appropriations of the Wilson Supply Ditch which was also recognized as senior to the tunnel and Wyoming, but not defined, and the appropriations of Sand Creek which was found not to be a tributary to the Laramie. Upon this was decided that there was apportioned to the State of Colorado by those recognized appropriations of the Skyline, the Meadows and the tunnel, 37,750 acre feet of water, which amount Colorado may withhold from Wyoming without violating Wyoming's rights to the equitable apportionment of the waters of this interstate stream.

(d) ACTS OF SUCH SERIOUS MAGNITUDE AS TO INVOKE THE EXTRAORDINARY POWER TO CONTROL THE CONDUCT OF A STATE AT THE SUIT OF ANOTHER ARE NOT HERE CLEARLY SHOWN.

This Court in the case of Conn. v. Mass., 282 U. S. 660 at page 669 said:

"The governing rule is that this Court will not exert its extraordinary power to control the conduct of one State at the suit of another, unless the threatened invasion of rights is of serious magnitude, and established by clear and convincing evidence. New York v. New Jersey, 256 U. S. 296, 309; 65 L. Ed. 937, 943."

Missouri v. Illinois, 200 U. S. 496, 521; 50 L. Ed. 572.

"The burden on Connecticut to sustain the allegations on which it seeks to prevent Massachusetts from making the proposed diversions is much greater than that generally required to be borne by one seeking an injunction in a suit between private parties. North Dakota v. Minnesota, 263 U. S. 365, 374; 68 L. Ed. 342."

Propositions of Law.

I.

The former suit was, and the present is, between two States, each appearing as parens patriae, and not in litigation or defense of the individual claims of a citizen in one State against another State or individual citizens of another State, nor citizens individually against others in the same or in the other State.

Wyoming v. Colorado, 286 U. S. 494, 508; 76 L. Ed. 1245, 1251.

Kentucky v. Indiana, 281 U. S. 163, 175; 74 L. Ed. 797.

North Dakota v. Minnesota, 263 U. S. 365, 375; 68 L. Ed. 342.

II.

The governing rule is that this Court will not exert its extraordinary power to control the conduct of one State at the suit of another, unless the threatened invasion of rights is of serious magnitude and established by clear and convincing evidence.

Connecticut v. Massachusetts, 282 U. S. 660, 670; 75 L. Ed. 1416.

North Dakota v. Minnesota, 263 U. S. 365, 374; 68 L. Ed. 342.

New York v. New Jersey, 256 U. S. 296, 309; 65 L. Ed. 937.

Missouri v. Illinois, 200 U. S. 496, 521; 50 L. Ed. 572.

III.

The official of Colorado charged with keeping the record of water diverted from the Laramie River into the Cache la Poudre is the Commissioner of Water District No. 3, not the Commissioner of Water District No. 48.

Colorado Compiled Laws of 1921, Sec. 1704.

IV.

Appropriation of Wilson Supply Ditch was determined by this Court in the modified decree of October 9th, 1922, and considered and affirmed in this case on ruling on motion to dismiss.

Wyoming v. Colorado, 259 U. S. 419; 260 U. S. 1; 66 L. Ed. 999.

Wyoming v. Colorado, 286 U. S. 494, 497; 76 L. Ed. 1245.

V.

Appropriation defined; doctrine of relation is to be applied from time purpose is formed and actual work begun, provided work is carried to completion with reasonable diligence.

Wyoming v. Colorado, 259 U. S. 419, 459, 490; 66 L. Ed. 999.

Sieber v. Frink, 7 Colo. 148, 153; 2 Pac. 901, 903.

VI.

The Colorado Supreme Court has held the decree in adjudication of water rights determines the date of priority of right and the volume or capacity.

Louden Co. v. Handy Ditch Co., 22 Colo. 102; 43 Pac. 535.

Arnold v. Roup, 61 Colo. 316, 326; 157 Pac. 202.

VII.

In 1907, land and water rights were severable in Wyoming; the waters could be sold separately and transferred and used elsewhere at the will of the owner.

Frank v. Hicker, 4 Wyo. 502, 528; 35 Pac. 475.

McPhail v. Forney, 4 Wyo. 556, 560; 35 Pac. 773.

Johnston v. Little Horse Co., 13 Wyo. 208; 79 Pac. 22.

Groo v. Sights, 22 Wyo. 19, 30; 134 Pac. 269.

VIII.

Colorado laws have long recognized conditional decrees of priorities in adjudication of water rights.

Waterman v. Hughes, 33 Colo. 270; 80 Pac. 891.
Water S. & S. Co. v. Larimer Co., 24 Colo. 322; 51 Pac. 496.
Compiled Laws, Colorado, 1921, Sec. 1798.

IX.

Litigation, foreclosure, changes of ownership, are vicissitudes to be considered in judging reasonable diligence.

Trowell v. Bijou, 65 Colo. 202, 208; 176 Pac. 292, 294.
Water Rights Crab Creek, 134 Wash. 7; 235 Pac. 37, 41-42.

X.

Pendency of the former suit until late 1922 prevented earlier completion of collection ditch of tunnel project.

Wyoming v. Colorado, 259 U. S. 419, 495; 66 L. Ed. 999.

Summary of the Argument.

1. The State of Colorado has always been willing to cooperate with the officials of Wyoming in efforts reasonably designed to re-assure Wyoming authorities as to the quantities of water diverted in Colorado from the Laramie River.

2. Colorado's measuring devices for trans-mountain diversions from the Laramie River are standard and adequate for such purpose; and the records sufficiently full and complete to determine the amounts of such diversions.

3. The defendant has not diverted from the Laramie River in any year since the entry of the decree in the former case in excess of 33,500 acre feet of water allocated for trans-mountain ditches with the exception of a comparatively small excess in 1929.

4. Defendant has not consumptively used and depleted the Laramie River at the State line for both trans-mountain and meadow land uses in excess of 37,750 acre feet, plus the Wilson Supply appropriation, for either of the years alleged in the bill, except a comparatively small excess in the year 1929.

5. Laramie-Poudre tunnel "project," appropriation includes West-side Ditch. Colorado has not through the Laramie-Poudre project diverted in excess of 15,500 acre feet. The bill does not allege West-side Ditch from Rawah Creek is an unlawful diversion. It is a part of the Laramie-Poudre project. It is not new, it has not lapsed. Diversion records of this project are fair. Its weir is standard, reliable, properly located. Complainant has full access to it and other measuring devices and records.

6. Colorado has not by meadow land diversions in Laramie Valley withheld to exceed 4,250 acre feet.

7. The Skyline Ditch Diversion is not excessive.

8. The Bob Creek, The Columbine Ditch and the Lost Lake System, as proposed to be operated (without in any year exceeding the amount of 37,750 acre feet allocated to Colorado) are not "illegal" diversions.

9. The Wilson Supply Ditch has been adjudicated in Colorado, and its rights were determined by this Court in the Modified Decree of October 9, 1922, and no enlargement of such ditch has been made since that date.

10. The Wilson Supply Ditch has not deprived the Meadow Lands on Sand Creek in Wyoming of water to which they were entitled.

11. The State of Wyoming has no cause for complaint by reason of alleged decrease in the annual stream flow of the Laramie River, since such decrease is not due to increased uses of Colorado appropriators, but to natural causes.

ARGUMENT.

I.

The State of Colorado, through Its Responsible Officials, has Always been Willing to Co-operate with the Officials of the State of Wyoming in Efforts Reasonably Designed to Reassure Wyoming Authorities as to the Quantities of Water Diverted from the Laramie River in Such State.

Under point 9 of complainant's brief, it is in effect urged that the evidence taken on the hearing before the Commissioners shows that the Colorado officials have refused to co-operate with officials of the State of Wyoming in making an inventory of the quantity of water diverted from the Laramie River to the Cache la Poudre water shed in Colorado.

On the contrary, we respectfully submit that a careful examination of the testimony adduced before the Commissioners discloses that the State of Colorado, acting by its proper officials, was at all times entirely willing that such a co-operative investigation be undertaken, provided the work was properly supervised so as to adequately protect the interests of all parties concerned.

The desire of Wyoming for such an investigation was first officially called to the attention of Mr. M. C. Hinderlider, State Engineer of Colorado, by the receipt of a letter from the State Engineer of Wyoming, Mr. Whiting, dated March 8, 1928 (Complainant's Exhibit No. 22; and found at page 992 of the Record).

This letter, as construed by its recipient, makes no request for the installation of other measuring devices, but refers primarily to the making of an inventory of the water resources of the Laramie River, and to an accounting of the trans-mountain diversions from the Laramie

River Basin to the Cache la Poudre River Basin in Colorado.

It appears from the evidence (R. 403) that these two officials had a conversation with respect to the desirability of such an inventory some time near the latter part of February or the early part of March, 1928, at which time Mr. Hinderlider stated to Mr. Whiting, in effect, that he had no objection whatsoever to the State of Wyoming making measurements of such trans-mountain diversions, or going over any particular measuring or recording device, but that he did not feel it would be advisable for Wyoming to install duplicate measuring devices for the reason that duplicate records so made would not agree by reason of variation in the physical installation in the stream and would therefore lead to confusion and further misunderstanding between the States concerned (R. 404).

Subsequent to above conversation and after the receipt of complainant's letter of March 8, 1928 (Complainant's Exhibit 22) Mr. Hinderlider promptly communicated with the Colorado ditch owners concerned, respecting the request of the State of Wyoming as indicated in the above numbered Exhibit, and asked for their views with respect to the same (R. 403). The Colorado State Engineer replied on March 12, 1928 (Complainant's Exhibit 31, R. 1000-C) to Mr. Whiting's letter of March 8, 1928, advising him that he had written to the Colorado Ditch owners and stated to them that he saw no particular objection to the granting of Wyoming's request for a co-operative investigation of the trans-mountain diversions involved, and that upon receipt of replies from the ditch owners he would further communicate with Mr. Whiting (R. 403).

Thereafter on March 26, 1928 (Complainant's Exhibit 23, R. 994-A), Mr. Hinderlider replied further to the letter of Mr. Whiting, stating that a meeting of the Colorado ditch owners would be held in the office of the State Engineer of Colorado on April 5, 1928, for the purpose of

considering the request made by the State of Wyoming as contained in Exhibit 22, and invited Mr. Whiting to attend the conference (R. 405). To this request Mr. Whiting replied under date of March 31, 1928, stating that he would not attend the conference for the reasons set forth in his letter (Complainant's Exhibit 24, R. 995).

The State Engineer of Colorado, after receipt of the last above referred to letter from Mr. Whiting, in which he declined to attend the conference with the Colorado ditch owners to be held in Mr. Hinderlider's office on April 5, 1928, again under date of April 2, 1928, wrote the State Engineer of Wyoming, further explaining the purpose of such conference and urging Mr. Whiting to be present (Complainant's Exhibit 25, R. 996-A). In this letter Mr. Hinderlider stated that the basis of the request made by the Colorado ditch owners for a conference:

> "* * * was for the purpose of meeting with you and through such conference to more definitely ascertain your position in this regard, especially with respect to the method of carrying out the proposed investigation.
>
> "It is my understanding that the Colorado water users are not adverse to such an investigation, provided the method of carrying out the same eliminates any chance of duplicate observations and conclusions.
>
> "In view of the fact that it will be needful to enter upon private property to make such investigation, it will be necessary to secure the co-operation of such ditch interests, and I therefore believe such conference between you and these ditch interests needful, prior to arranging for this investigation.
>
> "I will accordingly await your further reply in this regard hoping that you may find it con-

venient to come to Denver next Thursday for such conference * * *."

On April 3, 1928, Mr. Whiting replied to the foregoing communication from Mr. Hinderlider, reiterating that by reason of pressing official duties he would be unable to attend the conference with the Colorado water users in the office of the State Engineer, Hinderlider, but stating that he had requested Mr. Follansbee of the United States Geological Survey to attend the conference (Complainant's Exhibit 26, R. 997).

Failing in his efforts to obtain the presence of the State Engineer of Wyoming at the ditch owners' conference, Mr. Hinderlider convened the conference on April 5, 1928, at which were present, representatives of the various water owners in Colorado and also Mr. Follansbee (R. 406). At the request of the Colorado ditch and tunnel owners present, Mr. Follansbee presented his plan for a joint inventory of the water diverted from the Laramie into the Poudre River and for the installation of measuring devices in the ditches by the United States Geological Survey and the furnishing of certain records. This plan was generally unacceptable because among other reasons it involved turning over to an outside agency, namely, the United States Geological Survey, the measurement of water originating in the Laramie River Basin, and the measurement of water in the Cache la Poudre Basin by another agency, the State Engineer, and that such dual plan would lead to confusion and further misunderstandings. There was, however, no objection on the part of the Colorado water representatives to a joint investigation and inventory by the Colorado and Wyoming officials of the water diverted from the Laramie into the Cache la Poudre (R. 406 and 407).

While objecting to the plan suggested by Mr. Follansbee for the reasons stated, the Colorado water users

offered an alternative plan proposing that the State Engineers of the two States concerned inspect all measuring devices and equipment then in use, and that the owners of the works involved would make such further improvements and changes as the State Engineer of Wyoming might deem necessary in order to provide proper safeguards to Wyoming interests (R. 408). And further, that when such devices had been approved by the State Engineers of both States, joint measurements should be made of the water diverted from the Laramie, and that Wyoming should at all times have access to all equipment, automatic registers, and records of measurements and all data would be exchanged by the State Engineers of the two States.

Colorado representatives however deemed it impracticable to install duplicate measuring devices since such instruments could not be made to precisely agree by reason of varying physical conditions in connection with their installation and would necessarily lead to confusion in the records and further disagreement between the parties (R. 408). Mr. Hinderlider, testifying as shown by the record at page 408, further states that the ditch and tunnel representatives at this meeting expressed a most earnest desire to satisfy Wyoming with respect to the measurements and inventory of water diverted from the Laramie River and to assure the representatives of that State of their wish to co-operate to that end.

Thereafter under date of April 5, 1928, Mr. Hinderlider in a letter addressed to Mr. Whiting (Complainant's Exhibit 30, R. 1000-A), set forth the result of the ditch owners' meeting held on that date in the office of the State Engineer of Colorado, and again requested Mr. Whiting to suggest a convenient date at which time he could meet with the Colorado ditch owners and State Engineer to further consider the matters involved.

The State Engineer of Colorado further testifying, stated that in his opinion the plan for a joint inventory and accounting of the waters so diverted would be entirely practicable if made jointly by the State Engineers of the two States concerned (R. 408). The witness stated that he based his opinion as to the feasibility of such a joint undertaking by the two States largely upon his experience in administering the South Platte River Compact entered into between the States of Colorado and Nebraska in 1923, and the La Plata River Compact entered into between the States of New Mexico and Colorado in the year 1922. He stated that he had, as State Engineer, administered both Compacts on behalf of Colorado since the same had been in effect in co-operation with the State Engineers of the other two States concerned and that no material question had arisen relative to the accuracy of the measuring devices, stream flow or ditch diversions during that period (R. 409).

This witness further testifying states, that Mr. Whiting, the State Engineer of Wyoming, did not elect to accept the alternative plan suggested by the Colorado ditch owners and officials and that he made no written reply to the request for a further conference as proposed in his letter of April 5, 1928 (R. 409).

Notwithstanding that State Engineer Whiting failed to make reply to the request for a further conference, the State Engineer of Colorado made a further effort to resume negotiations in a letter dated May 2, 1929, addressed to Mr. Whiting in which the former suggested the desirability of a conference to further consider the matter of diversions from the Laramie River and offered the Colorado State Engineer to go to Cheyenne, Wyoming, for that purpose (Complainant's Exhibit 28, R. 998-A).

A conference was later held in Cheyenne, Wyoming, on May 7, 1929, which was attended by the legal and engineering representatives of both States. The discus-

sion at this conference covered both the interpretation of the decree of this Honorable Court, and the matter of making an inventory of the diversions from the Laramie River to the Colorado ditches in the Cache la Poudre River Basin (R. 415). At this conference, Colorado again offered to co-operate with Wyoming with respect to working out a satisfactory plan for measuring trans-mountain diversions. Wyoming was again assured that their officials would have free access at all times to the records, measuring devices, automatic registering charts and all other available data, and that Colorado would gladly make any improvements in such equipment as Mr. Whiting, the State of Wyoming might feel advisable and would furnish Wyoming officials the daily record of gauge height readings of the trans-mountain diversions (R. 416). However, Colorado's suggestions were not accepted and nothing definite resulted from this meeting. Two other conferences composed of the legal and engineering representatives of both States were held, one at Cheyenne, Wyoming, on May 20, 1929, and another at Greeley, Colorado, on September 26, 1930. At each of these conferences the discussion covered both the matter of making co-operative investigation of the measurement of trans-mountain diversions, and also the interpretation that each State placed upon the decree rendered by this Honorable Court on June 5, 1922, reported in 259th U. S. 419, as modified by the decree of October 9, 1922, and reported in 260th U. S. page 1. Colorado through its official representatives at each of these conferences offered to join in a co-operative investigation for the purpose of ascertaining the quantities of water diverted from the Laramie River but nothing concretely resulted from either of these conferences with respect to this matter (R. 416-417-418-420 and 813).

Moreover, as indicative of the co-operative attitude of mind on the part of Colorado officials and ditch owners, the evidence clearly discloses that Wyoming engineers and

investigators were given free and unhampered access to the measuring devices on the various ditches, as well as to all data and records in the State Engineer's office of Colorado even during the years they were actively engaged in the accumulation of data for use in the present suit. Deputy Engineer Drummond testifies as to inspection tests made by him on Colorado diversion works in 1928, 1929, 1930 and 1932 (R. 168, 171, 174). He states that the "Assistant Attorney General of Colorado informed me I could make any measurement of any ditch or stream I wanted to make in Colorado" (R. 180). Perhaps the most conclusive evidence in the record respecting this matter is that detailed by Wyoming's chief engineering witness Meeker, in which he said:

> "* * * I think I have at all times had free access to ascertain whatever information I wanted from the Colorado authorities * * *, and as to the records of the State Engineer's office, I have had free access. I have made very copious notes from them without interference" (R. 341).

In view of the above cited references to the testimony adduced on the hearing before the Commissioners, both oral and documentary, we respectfully submit that it clearly appears, that the officials of the State of Colorado have uniformly shown a wholehearted willingness to join with the officials of the State of Wyoming in a co-operative investigation designed for the measurement of the trans-mountain diversions from the Laramie River, and have also endeavored to give full respect and strict observance to the terms of the decree rendered by this Honorable Court in the cause herein.

II.

Colorado's Measuring Devices and Equipment Now Installed for Measuring Trans-Mountain Diversions of Water from the Laramie River Basin are Recognized as Standard and Adequate for Such Purpose; and the Records of the Water Officials are Sufficiently Full and Complete for Determining the Amounts of Such Diversions.

Complainant under Points 1 and 3, and incidentally in other portions, of its brief, challenges the sufficiency and accuracy of the measuring devices and the public records kept showing such diversions. In support of this contention complainant relies chiefly upon the testimony of her witness, R. I. Meeker, who directs his attacks primarily upon what he asserts are faulty methods of installation of equipment, and enlarges upon incidental and occasional omissions and errors made in the preparation of automatic register charts and similar records.

Notwithstanding that the State of Colorado has been willing to make any reasonable changes in equipment or methods in recording diversions which might be considered desirable by the Wyoming officials, as above discussed under Point 1, of this brief, we respectfully submit that the evidence herein detailed by thoroughly competent and qualified Irrigation Engineers, many of whom are of national reputation, overwhelmingly establishes the efficiency and adequacy of the mechanical devices now installed, as well as the reliability and accuracy within reasonable limits, of the records of defendant maintained for the purpose of recording and determining the amount of such diversions.

It will be borne in mind that the evidence herein discloses that there are six trans-mountain diversions from the Laramie River Basin, namely: The Laramie-Poudre Tunnel, Skyline, Bob Creek, Columbine, Lost Lake, Wilson

Supply Ditch (and the Sand Creek diversions, which the Court found in the former decree not to be a tributary of the Laramie River, 259 U. S., page 490).

On each of these ditches there is installed what is known as the standard rectangular flume and gauge rod at the side, with the exception of the Laramie-Poudre Tunnel which, since May, 1927, has been equipped with an improved type known as the Parshall Venturi Flume. The tunnel, Skyline and Sand Creek are equipped with an automatic recording device known as the Bristol Register, and the Columbine, Bob Creek and Lost Lake ditches each has the Stevens type of automatic register installed. (R. 805, 812.)

In referring to the value to be placed upon the records made by these automatic registering devices, M. C. Hinderlider, State Engineer of Colorado, states that:

> "The charts from all the registers in question constitute a record as good on the average as those ordinarily obtained from such equipmement under similar conditions" (R. 813).

And, testifying with respect to the automatic charts filed in the State Engineer's office, he says:

> "There are some discrepancies in these automatic charts but discrepancies covering a series of years will creep into records of any kind wherever they may be obtained and under any one's supervision * * * taken by and large such records will give an accurate record of the discharge made by the various ditches with a reasonable and proper degree of accuracy in view of the field conditions which prevail at the points where such records were taken." (R. 812; fol. 1851.)

C. L. Patterson, an engineer of wide experience and recognized standing in irrigation matters, testifying in behalf of defendant states:

"In my opinion based upon investigations of dozens of installations and what might be said to be hundreds of practical tests, the Parshall Flume is an excellent device for the measurement of stream flow." (R. 722; fol. 1615.)

In respect to the installation of the Parshall flume this witness further states:

"As to the installation of this measuring device at the Poudre Tunnel there was an error made in its original setting in connection with the gauge * * *. The correction due to the error in installation was made on June 16, 1927, approximately three weeks after the device was installed. The site where the installation has been made was created by nature and it is high up on a mountainside and straight sections on any of these mountain ditches is rarely available and in spite of disturbances due to deposits or bends above the point of installation, the device itself works under the conditions prevailing there" (R. 722 and 723).

And, in referring to the interpretation of Complainant's Exhibit No. 60, prepared by Wyoming's witness Meeker, he says:

"In my opinion it does not show divergencies and wide variations and disagreements, but on the contrary I feel the information itself indicates that the Parshall flume for the entire period since it was installed in 1927, with the partial exception of one month, July last past, has made a consistent and accurate record of the discharge of water from the tunnel" (R. 714).

And with respect to the recording devices covering diversions made through the Skyline Canal, this witness states:

"The Skyline measuring device is a standard rectangular flume * * *. It is equipped with standard automatic registering device located on as nearly a straight section of the ditch as could be found. The repeated meter tests of this flume show that periodically sand accumulates in it but in spite of these shifts in the discharge conditions, the record may be termed fairly good" (R. 724).

And in giving his estimate of the reliability of the measuring equipment now installed on the Sand Creek Ditch, Mr. Patterson further testifies as follows:

"That Mr. Meeker mentioned (in his testimony) the existence of the automatic register and of the shifting conditions due to sand, but apparently forgot to describe the flume in the Sand Creek ditch which is well located in a straight section of the ditch and of good concrete construction and where conditions for water measurements are good if not of a higher standard" (R. 725).

He further states that:

"Including all the trans-mountain ditches and considering them as a whole, I would class the record as good * * *. I am perfectly willing to admit that there are defects and imperfections and still I feel taking it as a whole the record properly should class as good" (R. 727).

R. J. Tipton, Irrigation Engineer, and fully qualified by his large experience in irrigation matters, particularly in the State of Colorado, testifying concerning the measuring devices and records states:

"In my opinion taking into consideration the physical conditions that exist at the outlet of the tunnel and the shape, direction and operation of the channel leading to the flume, I would say that

the Parshall flume is the best measuring device that could be made use of under the physical conditions" (R. 836).

And further testifying as to his estimate of the value properly to be placed upon the measuring devices in the various trans-mountain ditches and the records made in connection therewith, this witness states:

> "I think the Sand Creek, Skyline ditch and the automatic recording devices are entirely adequate to serve their purpose if properly maintained * * *. I have examined all the automatic register charts pertaining to Sand Creek, Skyline and Laramie-Poudre Tunnel in detail for the purpose of using those charts to compute the amount of water diverted by those ditches. In my opinion in general, the charts are sufficiently complete and accurate for the determination of the discharge of the diversions from the Laramie River" (R. 841).

E. B. House, Professor of Irrigation Engineering at the State Agricultural College of Colorado, and of wide and varied experience both from a practical, as well as from the academic point of view in irrigation matters, testified:

> "It is my opinion that the equipment and recording devices (on the Skyline ditch) are adequate in every respect to assure proper measurements of water passing through the flume * * * and register charts on file in the State Engineer's office furnish a good record within practical limits of accuracy of the flow of water from the Skyline ditch" (R. 758).

And further testifying this witness states:

> "I have examined the automatic register charts of the Laramie Poudre Tunnel on file in the office

of the State Engineer and it is my opinion that those charts constitute a record of the flow of water through the Laramie-Poudre Tunnel within reasonable limits of accuracy" (R. 760).

And again:

"It is my opinion that the Parshall or Venturi measuring flume and the automatic register charts on file in the office of the State Engineer for Colorado give sufficient information to enable one to ascertain the discharge of water through the Laramie-Poudre Tunnel within practical limits of accuracy and that this information can be obtained from the records on file in the office of the State Engineer" (R. 761).

This witness also stated with respect to the dependability to be placed upon the Sand Creek ditch measuring devices and records that:

"The structure is placed in a straight section of the ditch and is in my judgment located in the best position possible on that ditch. It has a Bristol automatic register installed * * *. I have examined the automatic register charts from the Sand Creek rating flume on file in the State Engineer's office and it is my opinion that those charts constitute a fair record of the water diverted through the Sand Creek ditch * * *" (R. 761).

In explaining the rating as to accuracy, to which these various ditch records are entitled, this witness further states, in effect, that the United States Geological Survey classifies as "excellent" records relating to water measurements where the error is less than 5%; as "good" where the error is less than 10%; as "fair" where the error is less than 15% and as "poor" where the error is more than 20%:

"In view of this classification of the United States Geological Survey I would classify the records of the trans-mountain diversions by the Laramie-Poudre Tunnel as excellent; * * * the diversions made by the Skyline as excellent; * * * and those of the Sand Creek or Wilson Supply system as excellent" (R. 840).

H. L. Potts, Civil Engineer for the Denver Water Board and in immediate charge of Denver's gauging stations maintained in the South Platte, testifying says:

"The Parshall flume is a very accurate measuring device and practically fool-proof * * *" (R. 745).

"In my opinion the present measuring flume at the Laramie-Poudre Tunnel is the only device for properly measuring water at that point under the physical conditions that there exist. * * *" (R. 751).

"While I would not say that the installation at the Laramie-Poudre Tunnel is an ideal one, I do say that it is within practical limits of accuracy * * *" (R. 757).

"I believe that I have examined all the old automatic register charts for the Laramie-Poudre Tunnel * * * and while I would not say that the records are good I feel that taken as a whole a fair field measurement can be determined. By fair field measurement I mean within a reasonable degree of accuracy" (R. 750).

And in placing his estimate with respect to the reliability and value of the measuring devices on the Skyline ditch this witness states:

"I also visited the flume at the Skyline ditch and observed the physical conditions that existed.

The measuring device or flume on that ditch is a standard stilling well, and a Bristol water gauge" * * * (R. 751).

"In my opinion based upon my examination of the charts and rating tables I would say that the amount of water diverted by the Skyline ditch can be ascertained within reasonable limits" (R. 752).

And further testifying with respect to the Sand Creek diversions he states:

"On this same trip I visited the Sand Creek ditch * * * the location is as good as could be possibly found in that canal. It is equipped with a stilling well and an automatic Bristol recording gauge which is standard equipment" (R. 752).

"I have examined complainant's Exhibits Nos. 67, 68, 69, 70 and 71, which are the automatic register charts on Sand Creek ditch for the years 1923 to 1928, inclusive, and while I could not grade those charts quite as high as the charts for the other two stations, yet I would say that by an examination of each individual chart I feel that they constitute a fair record. * * *

"I have also examined the automatic register charts at the Sand Creek rating flume for 1929 to 1932, inclusive. I would say that as to these charts they constitute a fair record a little bit better than the ones previously mentioned" (R. 753).

George M. Bull, consulting engineer for the Water Board of Denver, who has had extensive experience in water problems, testifying says:

"In my opinion the measuring devices on those several ditches (Laramie-Poudre Tunnel, Skyline and Sand Creek) ought to be checked over carefully in the spring against freezing and frost and also

> have careful and systematic metering because of possible deposits of sand, and if so, I would say that they are proper and adequate measuring devices and they compare favorably with similar devices maintained by the Denver Water Board" (R. 767).

Louis L. Stimson, an irrigation and drainage engineer of long experience with Colorado irrigation conditions, testified:

> "I would say that that flume (Sand Creek) is in good condition for the measurement of water and in fact is as good a rating flume as I have ever read. The flume is * * * well located and everything is in good condition accurately to measure the water" (R. 781).

Ralph L. Parshall, Senior Irrigation Engineer for the Bureau of Agricultural Engineering, United States Department of Agriculture, located at Fort Collins, Colorado, and of large experience, both as College Instructor and as an Investigator of Agricultural Engineering problems relating to irrigation, testified concerning the reliability of the flume installed at the tunnel outlet. This witness, while disclaiming that the idea upon which this measuring device is based was original with him, yet the record shows that by reason of his extensive investigations and improvements in the design of the device, the flume has become universally known as the Parshall or Venturi flume and is so recognized by American Society of Civil Engineers (R. 627). Besides some 2500 of this design of flume being used on the canals and ditches in the State of Colorado, it is also widely used in many of the Western States and several hundred have been installed in the canals of the Hawaiian Islands, as well as numerous installations in the ditches and the canals of South Africa, Argentine Republic, Honduras, Peru, British Columbia and Russia (R. 628).

The Parshall flume was first installed on the Laramie-Poudre Tunnel outlet in May of 1927, and by reason of a faulty installation there resulted an error of .16 of a foot above the proper gauge heights; the error was discovered about three weeks later on June 16, 1927, and the fault corrected. Even during this period between the installation and the time of the discovery and correction of the error, this witness states that it would have been entirely possible for an engineer to determine by reference to the earlier charts the true gauge height, and therefore the correct discharge then being made by that flume (R. 631).

In appraising the reliability of the flume installed on the Laramie-Poudre Tunnel outlet, this witness testified as follows:

> "The operation of the Laramie-Poudre flume is remarkable under the conditions as evidenced by the measurements shown in defendant's Exhibit E-1 (R. 1494-A). In my opinion taking it throughout the season, I am absolutely convinced that the flume installed at the outlet of the Laramie-Poudre Tunnel operates well within the practical limits of accuracy even though it is hampered by debris from the channel. It is remarkable even under such conditions as existed that it stays so close that I think with ordinary care it would be practically well within the limits of accuracy. I don't know any other measuring device that could be used there to better advantage" (R. 635).

It is worthy of note in the consideration of this matter that Wyoming witnesses fail to suggest any practical plan or change which should be made in the equipment on any of the diversion works in Colorado, that would result in more accurate measurements made by any such ditches.

Complainant further suggests on pages 17 and 47 of its brief that the persons employed as readers of the mechanical measuring devices are not sufficiently experienced and competent to properly discharge their duties.

In this connection the Court's attention is called to the testimony of witness McAnelly at page 684 of the Record wherein he details the duties required of the gauge readers, and in which he says that the duties do not require a man of technical training nor necessarily of previous experience, but that in his opinion the only qualifications he considers necessary to make a competent gauge reader are that he be conscientious in his work and follow the instructions given him with respect to reporting the flow of water as recorded on the charts in 24-hour periods (R. 684). This witness then refers to the gauge reader on each of the diversions, Tunnel, Skyline, Sand Creek, Lost Lake, Bob Creek and Columbine, and states that each is fully competent to meet the requirements of his particular position.

Likewise, defendant's engineer witnesses, Professor House, Potts and Field, testified that after interviewing the gauge reader at the Tunnel, Skyline and Sand Creek ditches they considered such employees intelligent and fully competent to discharge the duties pertaining to their employment (R. 750, 752, 753, 760 and 828).

Complainant in its brief, on page 47, makes the bold and daring statement that "all automatic chart records of trans-mountain diversions from the Laramie River in Colorado were destroyed." Stated thus without qualification or explanation, such statement carries with it an evil and sinister implication that cannot be permitted to stand unchallenged. The statement, as broadly made, is not only unsustained by the facts, but is affirmatively disproved by the testimony of complainant's own witnesses. Wyoming's chief witness, Mr. Meeker, as well as other of her witnesses, made use of hundreds of automatic charts in

the preparation of this case, which were supplied by Colorado, and concerning which Mr. Meeker testified in effect that he was given unhindered access by Colorado authorities (R. 341, 365).

The only semblance of fact on which such statement could be based is the testimony of Wm. J. McAnelly, Commissioner of Water District No. 3, wherein he stated that "I burned all the accumulation that I had in the box up to 1925. * * * I had them in a box in the basement, and they got wet, mildewed, had coal dust on them and I just put them in the furnace" (Typewritten Record, page 1530, and Record Abstract 690). These old charts that were burned included not only those from the ditches here involved, but also from other ditches in that water district concerning none of which ditches was there any litigation then pending (R. 690).

However, all the information contained in the burned charts had theretofore been copied and was included in the written reports forwarded by the water commissioners to the State Engineer's office, and were then on file and available to any one desiring to examine the same (R. 691, 694). Prior to the year 1925, there was no requirement that the automatic registering charts be sent to the office of the State Engineer, but from 1926 all such charts were required to be forwarded to that office, and were accessible to and made use of by the complainant in the preparation of its exhibits in the present case (Typewritten Record, pages 1530, 1531).

In view of the overwhelming weight of the testimony as given by above named engineers, whose experience in irrigation problems, both practical and academic, accords to them a standing and value which cannot be challenged, we submit that the sufficiency and reliability of the measuring devices installed on the several trans-mountain diversions in Colorado ditches and canals, the competency of

the employes in charge of such devices, as well as the dependability of the records evidencing such diversions, is clearly and fully established.

The labored attempt of the complainant by minute and painstaking detail to discover and display before this Honorable Court some incidental and slight irregularities and omissions in the great mass of records evidencing the Colorado diversions from the Laramie River Basin is wholly insufficient to justify any serious question as to their authenticity, and its challenge to the reliability and dependability of Colorado's measuring devices and records must completely and utterly fail.

III.

The State of Colorado has Not Diverted from the Laramie River in Any Year, During the Eleven Year Period Since the Entry of a Decree in the Former Case, in Excess of 33,500 Acre Feet of Water as Allocated to Colorado for Trans-Mountain Ditches, with the Exception of a Comparatively Small Excess for the Year 1929.

By making use of all automatic register charts, rating tables, water commissioner's weekly reports, and all other available records in the State Engineer's office in Colorado, relating to the administration of the several trans-mountain diversions from the Laramie River to the Cache la Poudre Basin, the authenticity of which records is established by the engineer witnesses, whose testimony is referred to under Point II of this brief, independent computations were made showing the total diversions by each of such ditches for the years 1922 to 1932, both inclusive. These computations and tabulations were made by R. J. Tipton and C. L. Patterson, whose experience, qualifications and professional standing, respectively, are detailed at pages 504 to 508 and 696 to 699 of this record.

At page 1615 of the Record appears defendant's Exhibit J-3, prepared by witness Tipton, which gives a summary of the total trans-mountain diversions made to the Cache la Poudre Basin for the years 1922 to 1932, inclusive. In column 8 of this Exhibit is found the total for each of the above years, including the Sand Creek diversion which is not a tributary of the Laramie River. The mean diversion with such inclusion for the above years is shown to be 30,236 acre feet (R. 856).

In column 9 of the Exhibit is given the total yearly diversions with those of Sand Creek, excluded. This in detail shows the annual diversion to have been for 1922, 24,081 acre feet; 1923, 29,088 acre feet; 1924, 18,160 acre feet; 1925, 27,082 acre feet; 1926, 26,735 acre feet; 1927, 31,559 acre feet; 1928, 30,949 acre feet; 1929, 35,593 acre feet; 1930, 22,259 acre feet; 1931, 17,508 acre feet; 1932, 32,640 acre feet, with a mean or average of 26,878 acre feet for the period of eleven years which is only 80% of the 33,500 acre feet designated in the former decree as strictly trans-mountain allocation to the State of Colorado (R. 856).

As above indicated an entirely independent investigation and computation was also undertaken by C. L. Patterson, Engineer, for the purpose of ascertaining the annual and total diversions for the period 1922 to 1932, inclusive, from the records and material in the State Engineer's office in Colorado, the final results of which are substantially in accord with those arrived at by witness R. J. Tipton.

It will be noted witness Patterson finds the average of all trans-mountain diversions for the eleven-year period, including Sand Creek, to be 30,293 acre feet (R. 720), while witness Tipton finds the average for such diversion to be 30,236 acre feet. Similarly Mr. Patterson's computations, excluding Sand Creek diversions, show an average for the

eleven-year period of 26,908 acre feet, while Mr. Tipton finds the average to be 26,878 acre feet (R. 856). Both engineers agree that all combined diversions from the Laramie River and its tributaries for the eleven-year period have not exceeded 80% of the 33,500 acre feet allocated by the former decree (R. 720-721).

It is true that it appears from the testimony of complainant's witness, R. I. Meeker, that he arrived at a total diversion for all trans-mountain diversions for the year 1926 in excess of the 33,500 acre feet allocated for such ditches (R. 376-377, Typewritten R. 189, and Complainant's Exhibit 3, R. 974).

An examination of that testimony, however, discloses that his computation is based upon a report not required by statute, which purports to show the diversion made by the Laramie-Poudre Tunnel from March 1 to October 1, 1926, to have been in the amount of 13,572 acre feet, when in fact the diversion made by the Tunnel for 1926 was at least 5,000 acre feet less, as is fully discussed under Point 5-B of this brief in connection with Tunnel Project, and by defendant's Exhibits T and J-3 (R. 1467 and 1615).

The relatively small excess which occurred during the year 1929 which was inadvertently permitted by the State Engineer of Colorado represented a run of a very few days at the close of that season. This excess amounted to about 2,093 acre feet, or about 6% of the total permitted trans-mountain diversions of 33,500 acre feet, or if the meadow land consumptive use of 4,250 acre feet be included in the calculation, the excess would amount to about 5½% of the total authorized diversion of 37,750 acre feet (Def. Ex. J-3, R. 1615). In this connection, State Engineer Hinderlider testified that the comparatively small excess in the diversions of 1929 was an "inadvertent" and unintended oversight. That it was his purpose to strictly comply with the terms of the decree, and to deny diversions to Colorado ditches in any amount over

the total allocation authorized by the decree in the former case (R. 818).

A further examination of defendant's Exhibit J-3, column 3, found at Record page 1615, discloses that not once during the eleven-year period 1922 to 1932, inclusive, did the diversions of the Laramie-Poudre Tunnel exceed or even equal the allocation of 15,500 acre feet apportioned by the 1922 decree of this Court to the State of Colorado for that appropriator. The mean or average yearly diversion for that project for that period was 7,894 acre feet. It is true that the Skyline ditch, column 3, of this Exhibit, is shown to have diverted in five of the eleven years in excess of the 18,000 acre feet mean named in the decree, but average or mean for the full period of eleven years since the entry of the 1922 decree shows 17,808 acre feet, which is well within the desginated 18,000 acre feet referred to in the decree. Likewise the computations made by witness Patterson discloses that the average Skyline diversion for the eleven-year period amounts to 17,941 acre feet (R. 718).

The computations made by both engineer witnesses agree that the average total diversions made by all transmountain ditches, exclusive of Sand Creek, are less than 27,000 acre feet, or about 80% of the 33,500 acre feet allocated by the decree (R. 720-721).

It seems to be a fair and reasonable assumption from the facts which were before the Court at the time of the rendition of the decree in the former case that it was intended that the limitation of 33,500 acre feet for transmountain diversions, particularly as applied to the Skyline ditch, should be based upon an average or mean appropriation, rather than upon a strict limitation to 18,000 acre feet for each individual year.

In this connection it will be recalled that the Court had before it in the former suit defendant's Exhibit 124,

which set forth the diversions of the Skyline for a sixteen-year period, 1899 to 1913, inclusive, during seven years of which period the annual diversions were in excess of 18,000 acre feet and four years of which were in excess of 22,000 acre feet. During the balance of said sixteen-year period, the annual diversions were sufficiently low so as to bring the mean or average for the period to about 18,000 acre feet. The Exhibit No. 124, in the former case, is now included in defendant's Exhibit M-3 (R. 1619) and testimony of defendant's witness Tipton in respect thereto is found at page 861 of the Record. If the diversions had been strictly limited to 18,000 acre feet in any one season the mean diversion for the period 1899 to 1913 would have been about 16,700 acre feet, or an average of approximately 1,300 acre feet less per year than the 18,000 allocation as set forth in the decree (R. 862).

Since the entry of the 1922 decree, as indicated by defendant's Exhibit M-3, the mean annual diversion of the Skyline was 17,808 acre feet. If the Skyline diversions had been strictly limited to 18,000 acre feet in any one year during the 1922 to 1932 period, the mean annual diversions would have been about 16,650 acre feet, or approximately 18,000 acre feet.

Inasmuch as this Honorable Court had before it in 1922 defendant's Exhibit 124, which showed annual diversions for seven of the sixteen-year period in excess of the 18,000 acre feet and presumably upon that basis fixed 18,000 acre feet as an equitable and proper allocation to the State of Colorado, when considering the requirements of the Skyline Ditch, it must have intended and contemplated that such figure was an average yearly use and not a strict limitation to 18,000 acre feet for each year.

A contrary interpretation, such as is urged by the complainant herein, would result in unfairly depriving the State of Colorado and its trans-mountain appropriators of a portion of its fair and reasonable use of the water

which Colorado appropriators had enjoyed prior to the filing of the former suit, and which the Court recognized as a prior use (R. 733-861-862).

In this connection we desire to further emphasize the fact as disclosed by the testimony of defendant's engineers Patterson and Tipton, that the average total trans-mountain diversions of Colorado users for the period of 1922 to 1932, inclusive, have been only 80% of the 33,500 acre feet named in the decree of this Court (R. 721-855 and Def. Exhibit J-3, p. 1615).

IV.

The State of Colorado has Not Consumptively Used, and Thereby Depleted the Laramie River at the State Line, for Both Trans-Mountain and Meadow Land Uses, in Excess of 37,750 Acre Feet, Plus the Wilson Supply Appropriation, as Recognized in the Former Decree, for Either of the Years Alleged in the Bill of Complaint, Except a Comparatively Small Excess in the Year 1929.

The complainant under Point III of its brief urges that the State of Colorado through its recognized appropriators, and principally as a result of its meadow land diversions, has very largely exceeded the amount of diversion authorized by the decree of this Court in the former case.

On the contrary, the defendant asserts that under a reasonable and logical construction of that decree, this Honorable Court intended to, and did, allocate to the State of Colorado, for the use of its appropriators, a total or mass allocation of 37,750 acre feet, plus the Wilson Supply appropriation, rather than strictly limiting the amount for the use of the individual ditches specifically to that itemized in the decree.

The reasons underlying this interpretation of that decree are, first, that this Court announced in said opinion that the action involved was not between individual appropriators, residing on opposite sides of the interstate line, but rather *was an action between sovereign states* (Wyoming v. Colorado, 259 U. S. 468, 286 U. S. 509), which represented and spoke for the individual water users residing within the respective bounds of the two litigating states. And second, the Court determined what, under the evidence, it deemed to be an amount which the State of Colorado could fairly and equitably "withhold" from the State of Wyoming, which amount it fixed at 37,750 acre feet annually, plus the Wilson Supply appropriation. In other words, the Court, speaking through its decree, was dealing not with individual ditch owners, but rather with sovereign states and upon that basis fixed Colorado's allocation at a definite amount of 37,750 acre feet per year, leaving the matter of apportionment to individual Colorado ditches to the proper State authorities as a matter of internal administration. In determining the total amount that the State of Colorado could justly "withhold" from the State of Wyoming, it was of necessity proper and imperative that the Court should take into consideration the individual appropriators and their respective dates of priority, but only for the purpose of determining the total or mass allocation which should be decreed to the State of Colorado. It is perfectly obvious that upon the Court reaching a conclusion that Colorado was equitably entitled to withhold 37,750 acre feet from Wyoming, that neither Wyoming nor its appropriators would have any just concern or interest in the manner of withdrawal or extent of use by individual appropriators so long as the total allocation to the State was not exceeded.

That such a construction was placed upon the decree by certain of the responsible officials of the State of Wyoming is disclosed by the testimony of M. C. Hinder-

lider, State Engineer of Colorado, in referring to matters under consideration at a conference of the legal and engineering representatives of the two states held at Greeley, Colorado, in September, 1930. At that conference, the then Attorney General Wilson of Wyoming was asked in effect if he construed the Court's decree to mean "that the amount of 37,750 acre feet was in the nature of a mass allocation to the State of Colorado and her agents," to which, Attorney General Wilson replied in the affirmative. And Attorney General Wilson, further responding to an inquiry, said in effect, that there would be no objection on the part of Wyoming if any of the Colorado agencies should divert in any year more than the amount designated in the decree, "so long as diversions by other (Colorado) agencies were reduced to the extent of holding their total diversion or use in any one year to 37,750 acre feet in addition to the Wilson Supply appropriation" (R. 418). The testimony of the then Assistant Attorney General Harrison of Colorado is also pertinent and corroborative with respect to this same matter (R. 418, 421).

It is further argued under this point of complainant's brief, that Colorado has permitted diversions for use on the mountain meadow lands, as determined by headgate measurements, largely in excess of the amount of 4,250 acre feet diversion as named in the former decree. This defendant, however, asserts that the evidence submitted in this case, clearly establishes that the consumptive use of water in the meadow lands and the consequent depletion of the interstate stream at the State line, has not resulted in "withholding" from Wyoming in excess of 4,250 acre feet of the waters of said interstate stream (Testimony Tipton, R. 874, and Patterson, R. 721, 728).

In this connection it is worthy to note the physical setting, the character of the soil, climatic conditions, and the limited type of agriculture which prevails in the Colorado meadow lands, all of which combine in making it im-

perative for the use of the particular method of irrigation which the evidence discloses has uniformly been employed in that high mountain valley from the time of the first settlers some fifty years ago.

The evidence discloses that the meadow lands in the Laramie River Valley in Colorado are situate in the high mountains with a varying altitude of about 7600 to 8500 feet above sea level, the irrigated land lies immediately adjacent to the Laramie River and its tributaries with a gradual slope toward the thread of the stream. The valley has a width varying from about 200 feet to approximately three-fourths of a mile surrounded on the South, East and West by high mountains constituting a closed basin which opens only to the North along the channel of the Laramie River which flows into the State of Wyoming. Testimony: M. C. Hinderlider, Roderick L. Downing (R. 396, 452). The soil is a porous, sandy mountain loam underlain with gravel, and the irrigated lands extend in Colorado for a distance of about sixteen miles south from the interstate line (R. 512, 522, 528).

The climatic conditions result in a short growing season which limits the crop produced to the single one of mountain hay, requiring irrigation by what is known as the flooding system for a period extending from about the middle of May to the middle or latter part of July, thus covering about sixty to seventy days (R. 484, 529, 768). The "flooding" method of irrigation employed in Colorado is the same as that practiced on the meadow lands in the State of Wyoming (R. 481, 485). Under this system, which is the only method that can be successfully employed on these high mountain reaches, water is turned on in the spring about May 15, and continues to gently flood the growing hay until the close of the season about the middle of July. The slope of the irrigated lands being toward the stream, together with the porous character of the soil, unite in causing practically all of the water,

other than the amount actually consumed in producing the hay crop, to return to the stream and is thus made available for Wyoming users down the stream. Testimony of Professor Keezer (R. 524), M. C. Hinderlider (R. 411, 412), C. L. Patterson (R. 729, 730), R. J. Tipton (R. 864).

In explanation of the basis for the interpretation of the decree for which Colorado here contends, the testimony of the Colorado irrigation engineers clearly shows, that in order to successfully produce a crop of hay under the climatic, soil and other physical conditions prevailing in the meadow lands, a headgate diversion of one acre foot per acre of land is wholly insufficient. And, although a much larger headgate diversion is necessary to produce a crop, such practice results in the actual consumption of only one acre foot of water per acre of land, and the stream is depleted only to that extent. This is due to the fact that the extra water diverted by the "flooding" method of irrigation returns to the stream for the use of Wyoming users with the exception of approximately one acre foot actually "used up" or consumed in the production of the crop of hay.

The above referred to testimony affirmatively shows, that not to exceed one acre foot of water per acre is actually used up in the production of a hay crop in the meadow lands, the balance in excess of that amount returning to the stream. And the further testimony of these witnesses, together with that of the ranchers of long practical experience with agricultural conditions in high mountain valleys, unite in the opinion that a limitation to 4,250 acre feet headgate diversions, as contended for by the State of Wyoming, would result in the practical destruction of farming operations in the Colorado meadow lands. In order to bring this situation concretely before the Court, we will set out an excerpt from the testimony, first, directed to the point that not to exceed one acre foot of water is actually consumed in the irrigation of one acre of

mountain meadow hay; and, second, that a limitation of 4,250 acre feet of water, headgate measurement, is wholly insufficient to irrigate 4,250 acres of meadow land:

M. C. Hinderlider, State Engineer of Colorado, testified:

> (1) "However, regardless of the amount of water diverted through the ditches for the irrigation of the meadow lands, there is only a certain amount actually consumed, the balance returns to the stream system. * * * So long as the stream is not depleted beyond 4,250 acre feet it does not appear that Wyoming has cause for complaint" (R. 411, 412).
>
> (2) "It would be utterly impossible, in my opinion, to successfully irrigate 4,250 acres of wild meadow lands by measurement of 4,250 acre feet of water at the head of those ditches" (R. 411).

And to the same effect is the testimony of C. L. Patterson, an irrigation engineer, to whose testimony reference has been made in other connections. He says:

> (1) "It is my opinion that the amount of 4,250 acre feet per annum of water naturally consumed by the meadow lands has not been exceeded. * * * That is based upon the belief that one acre foot per acre measured as consumptive use of water is reasonably adequate for the lands and crops of that valley * * *" (R. 728).
>
> "In the case of trans-mountain diversions the full amount of the diversion is consumed, so far as other appropriators on the stream are concerned, but with the meadow lands, it is only that part of the (headgate) diversion that is so taken and used as to be withheld from or not returned to the stream, which can affect the stream flow adversely to Wyoming interests" (R. 728).

(2) "In my opinion if the mountain meadow lands were limited to a headgate diversion of one foot per acre, the result would be disastrous for most of the value of the meadow lands would be destroyed; much of the acreage would have to be abandoned, and many of the residents would have to move away.

"* * * If these lands were abandoned they would revert to swampy conditions, producing willows, weeds and other non-valuable vegetation which would probably consume an amount of water so nearly equal to the present consumption as to result in little or no benefit to down-stream Wyoming users" (R. 730).

E. B. House, Professor of Irrigation Engineering, states:

(1) "In my opinion the consumptive use of water for irrigation of the meadow lands * * * amounts to .88 of an acre foot per acre per year, and I think that amount consumptively used will mature the average crop of hay raised in that locality" (R. 530).

(2) "In my opinion 4,250 acre feet of water applied to the surface of 4,250 acres of meadow lands in the Laramie River Valley in Colorado would be wholly insufficient to irrigate a crop of hay because the soil is thin and unrententive * * * it would drain so rapidly there would be little or none left to feed the grass roots. No crop could be successfully irrigated by the diversion of a quantity equal alone to the consumptive use" (R. 530).

R. J. Tipton, irrigation engineer, who has made varied and extensive studies, particularly in irrigation matters incident to conditions existing in Colorado, states:

(1) "When water is applied to land for the irrigation of a crop, a portion of the water is actually lost and does not return to the stream, and this loss is called consumptive use" (R. 513).

"* * * It is my opinion, that amount or value of consumptive use in the meadow lands of the Laramie River Basin in Colorado is less than one acre foot per acre and probably ranges between .7 and .9 acre foot per acre" (R. 517).

(2) "If the diversions for the meadow lands in Colorado were limited to 4,250 acre feet per year (headgate measurements), in my opinion, it would mean the destruction of a large amount of the 4,250 acres of meadow lands * * * because it is absolutely impossible to irrigate one acre of meadow land by the diversion of one acre foot of water" (R. 864).

To the same general effect is the testimony of Professor Alvin Keezer, Agronomist, State Agricultural College (R. 524, 525); H. L. Potts (R. 754); and George M. Bull (R. 768), all of whom are of recognized standing in their profession and thoroughly qualified to speak with respect to irrigation problems.

In the former case there was evidence in the record of the same general import as above detailed, and to the effect that the consumptive use of the meadow lands did not exceed one acre foot per acre, although many times that amount of water, as determined by headgate measurements, was diverted by the ditches. And further that there were 4,250 acres of irrigable land in the Laramie River Valley in Colorado, exclusive of Sand Creek. Testimony of John E. Fields and J. R. Wortham (Abstract of Record, Original case, page 1097, folio 3717 and 991, folio 3458). The reasonable inference from that testimony is that when the witnesses stated that it required one acre

foot per acre to produce a crop of hay on such lands, they had reference to "consumptive" use and not to headgate measurements, as now contended by the State of Wyoming.

In other words, the Court in considering such testimony for the purpose of determining what was an equitable apportionment between the two states, found under recognized rules, that Colorado could justly "withhold" from Wyoming and its appropriators, and thereby "consume" a total of 37,750 acre feet per acre, plus the Wilson Supply appropriation. It is apparent that the underlying concepts in the mind of the Court, at the time the decree was entered, was (1) to limit Colorado from "withholding" from Wyoming more than what the Court considered an equitable and a fair amount of water; and (2) to provide by the decree a reasonably sufficient amount of water for the use of the trans-mountain appropriators, and to successfully irrigate 4.250 acres of Colorado meadow lands. This is clearly indicated by the language used in the opinion, both in the original case, 259 U. S. 419, 490, and in the opinion on the motion to dismiss, 286 U. S. 494, 504. These opinions repeatedly make use of the phrases "withhold" from Wyoming appropriators, and as required "for the irrigation of that number (4,250) acres of native-hay meadows" in Colorado.

It thus appears to be a reasonable assumption from the evidence in the former case, and from the language employed in the several opinions, that both the witnesses and the Court had in mind, and were referring to the "consumptive" use of water, particularly when making reference to the meadow lands, and not to measured headgate diversions, as now insisted upon by Wyoming.

That such contention on the part of counsel for Wyoming is untenable, is further disclosed by the above quoted excerpts from the testimony of Colorado witnesses, and particularly that of Patterson, House and

Tipton. In the opinion of these witnesses, to strictly limit Colorado users in the meadow lands to 4,250 acre feet of water, as determined by headgate measurements, would result in the abandonment of much of the mountain meadow lands in Colorado. And further, that such a condition would result without any corresponding compensating advantages accruing to Wyoming appropriators for the reason that swampy, non-valuable vegetation, which would follow abandonment, would consume almost the same amount of water as is now consumed in producing a valuable hay crop, which is now grown in Colorado, without injury to Wyoming appropriators (R. 730).

Furthermore, to construe the former decree, as here urged by the defendant, whereby Colorado has the right to "consumptively" use 4,250 acre feet of water on the meadow lands, regardless of headgate diversions, is entirely consistent with the construction as applied to trans-mountain diversions. The effect of the decree in authorizing trans-mountain diversions to Colorado ditches is to authorize water in the total amount named to be "withheld" from Wyoming and consequently, so far as that State's interests are concerned, to be "consumptively" used. Such trans-mountain diversions, when made, are forever withdrawn from the Laramie River Basin, and are thereby consumed by Colorado users, and can never be returned to the stream for further use by Laramie River appropriators in Wyoming. Similarly, the amount of 4,250 acre feet of water is "consumptively" used on the meadow lands, and marks the extent of the depletion of the stream, since the excess diverted returns to the river for further beneficial use by Wyoming appropriators.

In the former case, it appeared in the evidence, and the Court so found, that the meadow land acreage in the Laramie Basin in Colorado did not exceed 4,250 acres (Abstract Record, Original case, p. 791). The testimony in the case at bar discloses that a complete plane table survey

was made by defendant's witness, Downing, commencing in August, 1931, as a result of which he found the total irrigable acreage, exclusive of Sand Creek, in the Laramie River Basin in Colorado to be 4234.5 acres (R. 442, 449, Defendant's Exhibit I, page 1402 A). Although Wyoming's witness, Meeker, did not fully accept the Downing map as being complete, another witness for Wyoming, John A. Whiting, testified that the acreage involved "was approximately 4,200 acres" (R. 219, 901). From this testimony, it clearly appears that there has been no enlargement or extension of the users of water in the Colorado meadow lands beyond the acreage shown by the evidence at the time of the former decree (R. 454).

It thus is shown by the evidence, that Colorado's trans-mountain diversions, discussed under Point III of this brief, did not exceed in any year of the eleven-year period since the entry of the former decree, a total of 33,500 acre feet, except a comparatively small excess in the year 1929. Adding to the trans-mountain allocated diversion of 33,500 acre feet, the 4,250 acre feet consumptively used in the meadow lands, Colorado, and its appropriators, have not consumptively used in excess of the total allocation made to the State of 37,750 acre feet of water with the exception of the year 1929.

V.

A. The Laramie-Poudre Project Comprises the Laramie-Poudre Tunnel and West Side Collection Ditch.

This system of appropriation in Colorado consists of the collection ditches and reservoirs and the tunnel which, together, divert and conduct water from the Laramie into the Cache la Poudre River. It was the subject of the previous suit, 259 U. S. 419, 260 U. S. 1, pending from 1911 to decision on modified decree October 9, 1922. There the

Court found its priority of appropriation related from construction work begun in late October, 1909. It had not yet been fully completed, nor had any water been run through it at the conclusion of the testimony in the former case in 1914. (Record there 453-4, 572, 5[illegible]45.)

It was a very expensive construction, having cost, for tunnel, lining, collection ditches and diversion works, upwards of $1,000,000. This cost was raised mainly by bonding the lands of the farmers of the Greeley Poudre Irrigation District, but in later years, in money and in their own work, by contributions from its stockholders, as a reorganized cooperative mutual irrigation company.

The former suit, in its bill of complaint, sought an injunction against diversion of a 71,000 intended acre feet appropriation by this system. It specifically mentioned the West and East Side Ditches and McIntyre Ditch with the tunnel as the works (Record there 9). During the pendency of that litigation its prosecution was largely suspended, except for partially lining the tunnel and construction of temporary diversion dam and inlet ditch to the Laramie River portal of the tunnel.

The troubles of the District followed institution of the suit. It brought on much lien litigation and foreclosure suits. A reorganization was necessary into a mutual irrigation company, which was done in the years following the 1922 decision. Through deeds from the District in June, 1925, and from the sheriff in December, 1925, the title was passed to the Laramie-Poudre Irrigation Company, the mutual organization. This company is comprised of members who exchanged their equities in the property for shares, of which the Irrigation District became the chief shareholder. The lien holders took shares for their liens. As a mutual irrigation company the appropriators more actively thenceforth advanced its completion.

The West Side or Lower Rawah Ditch had been fifty per cent completed in disconnected portions by 1913. The final right of way map for it, showing its intended completion, was filed in 1917 and approved May 5, 1924 (Ex. J, R. 1406). Preparatory work for its completion was undertaken and begun in 1928. It was completed to carry water from Rawah Creek in 1929 and 1930. Water was run through it in 1929, and from it through the tunnel in 1930. (O'Brien, R. 565, 571.)

In view of the magnitude of the work, the difficulties of mountain ditch construction, remote works, then lack of roads, short construction seasons at altitudes of 8500 to 9500 feet, intervention of the World War, with pre-war and post-war high costs and suspension of like works during our own participation, the severe agricultural depression following 1920, the serious threat upon this water right, cost of litigation and loss of credit from the long sustained litigation from 1911 to the end of 1922 in the Supreme Court, the consequent lien and mortgage foreclosures, we maintain not merely reasonable, but remarkable diligence and continuity of purpose and effort has been shown in completing the enterprise.

(1) WHAT IS DESIGNATED IN THE PLEADINGS AND EVIDENCE AS THE LARAMIE-POUDRE TUNNEL APPROPRIATION MEANS THOSE DIVERSION WORKS IN COLORADO COMPRISING ONE SYSTEM OF COLLECTION DITCHES OF WHICH THE TUNNEL IS A PART AND FOR WHICH IT IS THE CONDUIT TO THE POUDRE. IT IS THE LARAMIE-POUDRE PROJECT.

The tunnel is only a conduit. It gathers of itself no considerable amount of water although it gains a small seepage along its course. The water is collected and diverted and brought to the tunnel by its feeder cut from the river and by its system of collection ditches which intercept the water of the Laramie, and of its tributaries, and so deliver into the tunnel. That has always been the obvi-

ous plan and purpose of the collection ditches and works (Meeker, R. 333-335, 323, 325).

In its brief complainant separates, for argument, the tunnel and West Side Collection Ditch. We shall treat them together as the works for diversion, actual construction of which was begun in late October, 1909. The Court found and held that was the date for relation of the appropriation of "the so-called Laramie-Poudre property," "what is designated in the pleadings and evidence as the Laramie-Poudre Tunnel appropriation." 259 U. S. 496, 260 U. S. 1.

No issue is made in the Bill that the West Side Ditch is an additional or unlawful diversion under the decree here, otherwise, in certain particulars, alleged to have been violated.

But since complainant's brief argues it, and the taking of evidence was only in the nature of a deposition, with no opportunity to anticipate such claim, it seems well to here answer that argument.

(2) THE LARAMIE-POUDRE TUNNEL APPROPRIATION FROM RAWAH CREEK AND OTHER TRIBUTARIES OF THE LARAMIE IS NOT ADDITIONAL.

On page 13 of its brief, Wyoming specifies:

> "The questions now to be considered are limited to a construction of the former decree * * * (2) whether or not Colorado is entitled to divert the waters of Rawah Creek and other tributaries of the Laramie River under additional appropriations if the combined quantities diverted and taken from the Laramie River to the Cache la Poudre River, via the tunnel, do not exceed annually 15,500 acre feet; * * *"

The Lower Rawah or West Side Collection Ditch, the diversion from Rawah Creek and other tributaries of the

Laramie River, via the tunnel to the Cache la Poudre River is not "additional appropriations" and such terminology cannot make it so. It is an afterthought, not in the Bill of Complaint.

Both States have here appealed to the record in the former suit. The complaint (Rec. there 9) specifically complained against this diversion to be made by the "Rawah or West Side Ditch gathering water from McIntyre, Rawah, Mill, Fall and Rapid Creeks, six miles long, commenced about December 1, 1909." The answer there, of Colorado (Rec. there 33), and of the appropriators (Rec. there 42), described the undertaking as "a collection system for gathering the upper water of the river and its tributaries, a reservoir for impounding the same and a tunnel of about 12,000 feet in length for carrying the same." They were the very means of diversion for which the tunnel was to be the conduit. Designating them as the group of works by which Wyoming was apprehensive the flow of the Laramie would be depleted at the State line, the suit was brought to restrain that specific diversion project, then under construction.

This system of collection ditches, by which the water was to be gotten to the tunnel for carriage was particularly the subject of evidence as well as of pleading from which the decree resulted. The Laramie-Poudre Tunnel, as the most distinctive element, was the naturally apt, short, designation of that one of the several parts there enumerated in the bill of complaint and in the evidence. The context shows the whole diversion was meant.

The modified decree, 260 U. S. 1, identified it as "what is designated in the pleadings and evidence as the Laramie-Poudre tunnel appropriation." Reference to the pleadings and to the evidence shows the collection ditches from the Rawah and other tributaries of the Laramie were "what

is designated in the pleadings and evidence as the Laramie-Poudre tunnel appropriation."

The collection ditches were referred to as the means of appropriation in the opinion leading to the original decree, 259 U. S. 419, 490, 66 L. Ed. 999, 1023.

The opinion on motion to dismiss, 286 U. S. 494, 498, 76 L. Ed. 1245, 1247, recites:

> "The corporations, with Colorado's authority and permission, were proceeding to divert water from the Laramie in Colorado and to conduct it through a proposed tunnel into the valley of the Cache la Poudre in Colorado, there to be used in irrigation. The project was designed to divert from the Laramie 56,000 acre feet per annum at first and 15,000 more later on. The purpose of the suit was to prevent the proposed diversion, • • •"

and throughout seems to have no doubt but that the proposed diversion comprehended the intended means of diversion, the collection ditches. Without the collection ditches such a diversion was not possible, nor is even 15,500 acre feet diversion possible. Rec. Stimson, 461, O'Brien 565, Smith 554, Coy 579.

The average annual diversions for the eleven years from 1922 to 1932, inclusive, was 7,847 acre feet as computed by Patterson (R. 716), and 7,797 acre feet as computed by Tipton (Exhibit D-3, R. 1611). The first year the flow approached its maximum of 13,762 acre feet was in 1932.

In arriving at the measure of 15,500 acre feet for this project in the apportionment made between the States, the Court took care to explain, in assurance to the two States, as quoted on page 42 of complainant's brief, that the Colorado appropriations "will not be affected by any variation in the yearly flow but will receive their full measure

of water in all years." 259 U. S. 419, 485, 66 L. Ed. 999, 1021.

It plainly was intended the collection works could be proceeded with so that full measure of water could be received.

Complainant's brief, in referring to the appropriations of the tunnel project repeatedly describes it as an appropriation limited to the "headwaters of the Laramie River and its West Fork" and tries to show the Rawah and other tributaries tapped by the West Side Collection Ditch are a different supply. The phrase is volunteered. The decree did not in such language circumscribe the tunnel source of water. The West Side Ditch is six miles long. It is at the headwaters of the Laramie. But the attempted limitation is not the words of the decree

At page 26 of her brief, Wyoming concedes:

> "The tunnel, as an agency of the contemplated Laramie River system, was not intended to appropriate any water, but to receive and carry the water appropriated by all the various separate appropriations composing the project" and refers to complainant's Exhibit No. 82, R. 1147.

In concluding its argument under the separated head "the West Side Collection Ditch," at page 27, Wyoming's brief states:

"There is no appropriation to the Laramie River system" and again cites its Exhibit No. 82 as the evidence on which complainant relies. This Exhibit was incomplete, the testimony of one witness only, A. I. Akin, in proceedings in water adjudication of Laramie River priorities in Colorado. The remaining portions of that finding and decree proper to an understanding of what the local court found and adjudicated there was introduced by defendant as Exhibit H, R. 1299, 1927.

The same witness, Akin (R. 583-588) testified:

"I have been practically connected with the Greeley-Poudre or Laramie-Poudre project from 1902 up to this time. I was one of the original organizers of the first company and then I was with them right along up until now. I had charge of the field work and the construction nearly all the time up to the last few years." • • • "I know what comprised the system in 1911 when the Wyoming suit began and what comprises it now. It is the same. In 1911 it was carried on as an irrigation district enterprise and now it is a mutual irrigation company, owning the same works." • • • "The Laramie-Poudre tunnel project, in 1911, consisted in digging the ditches on the Laramie River side of the tunnel and the distributing ditches on the plains and the reservoirs. I had to do with locating a means to collect water from the Laramie River through engineers. The purpose, as to the means by which water was to be diverted from the Laramie River and the works were by building the West Side and East Side Ditches, the Upper and Lower Rawah Ditches and the tunnel. The tunnel itself was not capable of collecting a large amount of water, having in mind 15,500 acre feet, it could not be done."

"In the surveys I had to do with there was included the West Side Collection Ditch running to the tunnel." • • • "I know the West Side Collection Ditch is now completed. There has been no change practically in the method of getting water to the tunnel out of the Laramie River watershed from what was planned in the original project. It is the same line.

"The outcome of the Wyoming suit caused reduction in the manner of proceeding to completion

of work of the Laramie tunnel project. The outcome of that suit caused a change in the manner of completion of the Laramie-Poudre tunnel project, because we had to cut down the acreage in the irrigation, but so far as ditches to conduct the water, we did not make any change. The company has not been able to finish the whole system." • • •

"There has never been a year since I have been connected with the project and knew anything about it that there has not been some work done in the development of it, both in the years 1915, 1916 and 1917, they put in some new headgates over there, and they strengthened that intake ditch from the west fork of the Laramie down to the tunnel."

(3) FINDINGS AND DECREE IN WATER ADJUDICATION OF LARAMIE-POUDRE PROJECT.

Other pertinent general findings, in the adjudication proceedings, R. 1299-1302, are for convenience, in part here reproduced:

"The Greeley-Poudre Irrigation District, a quasi-public or municipal corporation, duly organized under the laws of the State of Colorado, is the owner and claimant herein of a general system of ditches, reservoirs and a tunnel now in process of construction in Water District No. 48, for the diversion, storage and conveyance of waters of the Laramie River and tributaries to the Cache la Poudre River, whence the same will be diverted into and carried, stored, and distributed and applied by means of a system of ditches and reservoirs in Larimer and Weld Counties, owned by the District, for the irrigation of 125,000 acres of land. • • • The Greeley-Poudre Irrigation District. The system of works, in Water District No. 48, shall be hereinafter designated in this and special findings as the 'Lara-

mie River System' of claimant and consists of the following several units, each of which is to a greater or less degree interdependent upon the other units operated therewith, all of which, working either alone or in conjunction one with another, constitute a complete system of works, the operation of each and all of the several units being necessary for the diversion and storage of water by the entire system: The Rawah Ditch; the Rawah and Lower Supply Ditch; the McIntyre Ditch; the Deadman and Nunn Creek Ditch; the Laramie River Tunnel; the Link Lake Reservoirs, Nos. 1 to 14 inclusive; and the Tunnel Reservoir. * * *"

Here follow recitals of obstacles to be overcome, rock work, costs there above ordinary, in getting in supplies and machinery, in getting and keeping labor force due to remoteness and short season for work, partial suspension since 1911 caused by the litigation by Wyoming involving the right to divert the waters of the Laramie by this system, and, in view of them, the exercise of diligence.

"This general finding shall apply to the whole system and each unit thereof and is made to avoid repetition insofar as possible. It shall apply to the several units of the system hereinafter enumerated, without special findings or reference hereto in the findings for each unit, and shall be taken as incorporated in and as a part of the findings for each unit.

"Each of the several units, while interdependent in large measure upon the other units of the system, nevertheless involves diversions from different tributaries of the Laramie River and is segregated into specific names and findings for the purpose of this decree. Each unit is given the same date of priority, and although different priority numbers

are given, nevertheless each unit of said system shall have equal priority with each of the other units thereof" (R. 1299-1302).

The decree, in its general provisions and special parts, was in accordance with said findings (R. 1363, 1376, 1381).

(4) TUNNEL AND COLLECTION DITCHES ARE ONE PROJECT AND TOGETHER FORM THE TUNNEL PROJECT OR APPROPRIATION.

In the former decision, Wyoming v. Colorado, 259 U. S. 419, 459, 66 L. Ed. 999, the Court in defining appropriation, recognized the doctrine of relation.

Wyoming was accorded the benefit of this doctrine of relation in 259 U. S. 490, and it was applied as to the diversion "spoken of in the evidence as the Laramie-Poudre tunnel diversions" and as "the Laramie-Poudre project."

The Court (p. 490) proceeded to examine and determine what was the true date of priority, "by relation," making no mention of the date of priority it had been awarded in the local courts under the laws of Colorado, which had related it to August 25, 1902.

> "The Laramie-Poudre project is composed of several units, originally distinct which underwent many changes before they were brought together in a single project. In its final form the project is intended to divert water by means of a tunnel from the Laramie River into the Poudre watershed, there to unite that water with water taken from the Cache la Poudre River, and then to convey the water many miles to the lower part of the Poudre Valley, where it is to be used in reclaiming and irrigating a body of land containing 125,000 acres. It is a large and ambitious project, whose several parts, as finally brought together (p. 491) are adjusted to the attain-

ment of that purpose. The parts were separately conceived, each having a purpose of its own. The project is now intended to draw on two independent sources of supply, each in a separate watershed. The appropriations are necessarily distinct. Neither adds anything to, nor subtracts anything from the status of the other. We are concerned with only one of them."

The Court so proceeds to consider only the Laramie project and treats it as *one* project, as distinguished from the *other*, or Poudre, unit or project. So considering it, and whether the one it was concerned with could be related to the part known as the Rawah or Link Ditch, the Court rejected that as not including, in 1902, a concept of getting the water into the Poudre by a tunnel, but through the Skyline, and continues:

• • • • •

"The plans were examined and re-examined, alternative modes and places of diversion were considered and investigated, particular features were eliminated and others added, and in 1909, but not before, the project was definitely brought into its present form" (p. 492).

• • • • •

"The tunnel was merely a mental conception until 1904. In March of that year a survey was made of a tunnel site, a ditch from the west fork of the Laramie to the east fork, and a channel reservoir on the east fork above the tunnel site. • • • Later, in 1904, a survey was made of a tunnel site, three collecting ditches and two pipe lines. • • • And so other plans, an alternative of a ditch around the mountains through a portion of Wyoming and back to Colorado, which would avoid the construction of a tunnel, through 1905 to 1908, are delineated (pp.

493, 494) to point out that, until the vote of the irrigation district to contract with the company to complete it and to issue the district bonds for the construction, in October, 1909, followed by actual work about the last of that month of boring the tunnel and making the diversion was begun, 'it was all in an inceptive and formative stage—investigations being almost constantly in progress to determine its feasibility and (p. 495) whether changes and alternatives should be adopted rather than the primary conception. It had not reached a point where there was a fixed and definite purpose to take it up and carry it through. An appropriation does not take priority by relation as of a time anterior to the existence of such a purpose. * * *'

"No separate appropriation was effected by what was done on the upper Rawah Ditch.

"The purpose to use it in connection with the Skyline was not carried out but abandoned. This as Link testified was its 'principal' purpose. The purpose to make it an accessory of the large project was secondary and contingent. Therefore the work on it cannot be taken as affecting or tolling back the priority of that project.

"Actual work in making the tunnel diversion was begun, as before shown, about the last of October, 1909. Thereafter it was prosecuted with [illegible] diligence, and in 1911, when this suit was [illegible], it had been carried so nearly to a state of completion that the assumption reasonably may be indulged that, but for the suit, the appropriation soon would have been perfected. We conclude that the appropriation should be accorded a priority by relation as of the latter part of October, 1909, when the work was begun." 259 U. S. 495.

Thus it is seen that the use of the words "appropriation," "project," "diversion" in connection with Laramie-Poudre, in the pleadings, evidence opinion and decree, all refer to what was then well understood, the appropriation from the Laramie River by works which were to divert the water for carriage out of the Laramie Valley into the Poudre; namely, the Collection Ditches specifically complained of in the Bill of Complaint, one of which is the West Side Collection Ditch. Wyoming well concedes the tunnel of itself does not collect any water. It would be futile without its accessories to capture the water.

In its well studied complaint here, brought late in 1930 after all these years of attention and study of the Laramie River controversy, Wyoming significantly made no specification of the West Side Ditch completion work, then and in 1929, going on notoriously to it and to all the world. No evidence was offered to dispute the continuity of purpose or effort, reasonableness of its completion to beneficial use, in view of this suit, the war, the depression, the difficult physical conditions, the distress of the farmers under it whose arid lands were bonded and incomplete in adequate water.

As Wyoming's brief concedes the West Side Collection Ditch is not designated in the Amended Bill of Complaint. But we differ with the novel contention first made in the brief, page 23, "nor did any appropriation of water from Rawah Creek receive recognition in the former decree," and "the use of this ditch is a new appropriation, not authorized by the former court decree. * * * it has no connection with the Laramie-Poudre tunnel appropriation."

The decree, 259 U. S. 496, characterized it as "The Laramie-Poudre project," the modified decree as "what is designated in the pleadings and evidence as the Laramie-Poudre tunnel appropriation"—which means the project

to *divert* the water by the diversion works, i. e., the collection ditches, and to *conduct* it through the proposed tunnel. Not the tunnel alone, as the conduit, but the *means* of *diversion* was what was being complained against, was sought to be restrained, and was adjudicated there.

(5) INDEPENDENT ENTITY AND APPROPRIATION LAPSE NOT SHOWN BY WITNESS COY'S TESTIMONY.

Wyoming's brief, p. 23 concedes:

> "The West Side Collection Ditch was commenced prior to 1910 in pursuit of the purpose to construct a system of ditches to collect the water of various streams tributary to the Laramie River," then goes on "under separate appropriations, although each proposed appropriation was to be a part of the Laramie-Poudre project." "The West Side Collection Ditch or Lower Rawah Ditch, as now constructed as an independent entity (citing testimony of Mr. Coy, R. 581), is the consummation of a purpose to divert the waters of Rawah Creek and other tributaries of the Laramie River emptying into it below the point of diversion of the Laramie-Poudre Tunnel appropriation after the original and, also, the second proposed plan of diverting the water of this stream had lapsed for more than twenty years."

Coy, the Laramie-Poudre construction engineer, also testified (R. 580-582):

> "When I answered that the Rawah Ditch as now built is an independent entity, I did not mean that it is a separate thing from the tunnel project. It is a part of the tunnel project. The Lower Rawah Ditch and the Upper Rawah Ditch and the East Side Collection Ditch are all a part of the tunnel project and they are all interdependent, a combination for the diversion of water from the Laramie River. The

tunnel carries the water after it is collected by the ditches.

"The Rawah Ditch did not then constitute an independent entity. It was always a part of the tunnel system.

"Under the original plans water went directly to the tunnel.

"The result of that lawsuit limiting the possible diversion from the tunnel of 15,500 acre feet did not cause an abandonment of the project, but they did not get the amount of water they originally contemplated. The 'Tunnel Project,' 'Greeley-Poudre Project,' 'Greeley-Poudre System,' is the idea of collecting all this water and taking it through. As to whether it was built by various independent appropriations to convey water to the tunnel, they were all decrees of equal standing" (R. 582).

As to lapse, in complainant's brief first suggested, Coy said:

"That work had to stop at the end of 1911 until after the litigation is completed. Other litigation in the way of lien foreclosures arose as the result of this after 1911. There were a multitude of liens of contractors and engineers and people who worked who filed liens for the amounts due. They continued until after the conclusion of the suit of Wyoming against Colorado. Then they were turned into shares of the mutual irrigation corporation now operating the system. * * *" (R. 582.)

There was an injunction sought from the highest Court of the land and the case was pending for more than eleven years which caused a hiatus, but there was no lapse in the continuity of purpose.

Coy also testified to due diligence in completion of the project for diversion from the Laramie by the tunnel and ditch (R. 580).

Other witnesses testified that the West Side Collection Ditch was a part of the tunnel system in 1909, that its purpose was to divert the water of tributaries at the headwaters of the Laramie to the tunnel mouth, and that it fulfills the same purpose now. (Akin, R. 585, O'Brien, R. 573, Mosier, R. 540.)

The West Side Collection Ditch is not a new ditch. It is a part of the Laramie-Poudre tunnel appropriation.

Engineer L. L. Stimson, who was for many years Chief Engineer of the Greeley-Poudre Irrigation District and the Laramie-Poudre Companies (R. 445-476), testified (R. 460-462):

> "About 1913 the tunnel was complete enough to take water from the Laramie and a ditch was put in across the valley intercepting a number of small streams to the West Laramie, about a quarter of a mile. In completing the West Side Collection Ditch in 1929 and 1930, it was run from the west end of this ditch across the Laramie Valley to Rawah Creek, about 29,000 feet. It had been half completed from Rawah Creek before. The lines were followed almost exactly as laid out by the Company's engineers in 1909 and 1910. There was a slight variation in substituting flumes by going around three tunnel sites, otherwise it was constructed on exactly the lines of 1909 and 1910. It goes to Rawah Creek at the same place. The 1909 and 1910 work was by hand work of men spread over four or five miles of the total ditch upon sections not joined. Because of the machinery used, it was necessary to start the 1929 work at the lower end where it joins the ditch that was built across

the valley. We had been operating that ditch and tunnel since about 1914, which only collected the waters of the West Fork and incidentally of the upper Rawah Ditch, which came into the West Fork several miles above the mouth of the tunnel. During all those years the District and Company have never been able to get their 15,500 acre feet of water.

"On Exhibit 'A' attached to the Amended Bill of Complaint, what is there designated 'Link Ditch' is the upper Rawah and the West Side Collection Ditch and East Side Collection Ditch, and so designated, are a part of the Laramie-Poudre project."

Note: The map as attached to the Amended Bill printed in the Record, p. 50A, does not fairly show the features of the streams and diversion works on the Laramie River in Colorado. This is mainly due to mechanical difficulties in reproduction. The connections by means of streams are obscured, so that a disjunctive effect is produced.

The Link Ditch, there shown as connecting with the Skyline Ditch, in fact discharges into the west branch of the Laramie River below the Skyline Ditch and above the tunnel. Meeker (R. 371).

Engineer Stimson (R. 455-476) has given a concise description of the Laramie Valley in Colorado, beginning at the head, or Cameron Pass, and extending down to the State line, altitudes, names of the ditches, their sequence on the stream, geological features, and the climatic conditions.

As to description, he says (R. 468):

"The Laramie-Poudre Tunnel Project consists of four things—the East Side, the West Side Collection Ditches, two of them, the Tunnel Reservoir, and the Laramie-Poudre or Greeley-Poudre Tunnel.

> The Upper Rawah Ditch and Link Lakes system, are only feeders of the West Side Collection Ditch. The West Side Collection Ditch is the ditch to collect all of the waters coming to it and transmitting them to the Tunnel. The Tunnel itself collects only a little bit of seepage—in wet years as much as three feet, and in dry years a fraction of a foot."

On connection of tunnel and collection ditches and on diligence, Stimson testified (R. 469):

> "There has been continuity of work on this Laramie-Poudre Tunnel Project since 1913. From 1913 to 1917 the Laramie-Poudre Tunnel was completed and cut into from the Laramie River, and the ditch across the Laramie River was built. The length of the Tunnel is 11,256 feet. The ditch across the valley is about 1,500 feet."

Stimson then, in some detail, recites (R. 468-472) the continued prosecution of the work by the Greeley-Poudre Irrigation District farmers from 1914 to the end of 1922, their prostration by this suit, their continuity of effort on the system, its distribution and collection ditches, by private funds, and contribution of their own labor when bonds could no longer be sold after the institution of the Wyoming injunction suit, at which time half of the $5,100,000 bonds had been issued and made a lien on their lands.

The farmers themselves in this District were without much capital or credit, the land dry, unimproved. Since the trial the effort has been to complete the works and all the forces of the limited resources of the owners have been used to do so.

When the suit was determined, in late 1922, reorganization had to take place, to clear up the multiplicity of lien foreclosure litigation which had ensued during the pendency of that suit and the suspension it brought on.

The purpose to complete the project since 1913 was never abandoned.

This reorganization was promptly undertaken after the 1922 decision and about the first of 1925, the interests of landowners and foreclosure claims were reassembled in the form of a mutual irrigation company, in which the District got the majority of shares issued. The rest went to lienholders. The present company is the continuation and successor of all the rights of the District and the original company.

New cash was raised. Since 1923 there has been spent toward completion of the system over $500,000, of which $123,000 was spent on the West Side Collection Ditch and $5,000 inside the tunnel.

The war and agricultural depression, beside this suit, had their part in hampering the landowners in prosecution of this costly work.

The priorities from the Cache la Poudre River were so late as to be practically without value, making necessary the Laramie River water. It could not stop at the west portal of the tunnel. The collection ditches were necessary as well, otherwise there would not be water enough for even the much reduced acreage of the District necessitated by the conclusion of the former suit.

Then resuming, as to the West Side Ditch completion, Stimson testifies (R. 473-476):

> "In the completion of the West Side Collection Ditch as a part of the Laramie-Poudre Tunnel Project, there has not been any variation made in the purpose or accomplishment of the construction. The West Side Collection Ditch was not made to take any more water or to deliver at any different place for diversion out of the Laramie River than was the plan in 1910, 11, 12, 13, 14. The line of its con-

struction does not divert from the Rawah Creek or any of the intercepting creeks at any different points than was the plan of 1909 to 1913. In the lower part two tunnels were constructed in 1910 and the West Side Ditch runs through them. There is a 20 foot drop in the lower end of that ditch. That drop was constructed in 1910. It is exactly the same drop as was in that ditch at the former taking of testimony in the former suit of Wyoming against Colorado. The line of right of way is not substantially different. There was not included in the project as it was in 1910 and 11 any other auxiliary unit as part of the Laramie-Poudre Tunnel Project. The dam of the reservoir was about 1,500 feet north of the line of the west portal of the tunnel. The purpose was to discharge that water into the Laramie-Poudre Tunnel. No different purpose has been accomplished by the present construction of the ditch.

* * *

"Between 1914 and 1929 occurred the lawsuit of Wyoming, which changed the amount of water that the Laramie-Poudre Company expected to get from the Laramie River from about 70,000 acre feet to 15,500 acre feet, and therefore it was necessary to cut the construction of the Tunnel Reservoir as it would cost too much money as a conduit to the West Portal of the Laramie-Poudre Tunnel. There was substituted, at least temporarily, the building of about 2,000 feet of ditch connecting the completed portion of the West Side Collection Ditch with the ditch that had been built in 1913 and 1914 across the Laramie Valley.

"The high water line of the Tunnel Reservoir as then projected is above the lower end of the West Side Collection Ditch. The water would have flowed across the tunnel reservoir and reached the same

point as now. I had to do with obtaining the rights of way for the tunnel system. I have seen all the maps that were filed in the U. S. Land Office, showing the right of way and the application for right of way. I myself made the map that was filed in 1917 and approved by the Land Office in 1924, which is the last map. (See Exhibit 'J,' R. 1406). There was not in either of those maps a difference with respect to where the water of the lower end of the West Side Collection Ditch was to lead directly into the Tunnel. * * *

"Defendant's Exhibit J, sheet 1 (printed at R. 1405), is the map 'Laramie Tunnel Ditches and Feeders by the Laramie Reservoir and Irrigation Company,' * * * approved March 29, 1909, by Assistant Secretary of the Interior.

"The other three sheets are entitled 'Map of Amended Survey of Partially Completed Portions of the Laramie Tunnel Ditches and Feeders,' showing it was filed December 29, 1917, with the Register of the United States Land Office at Denver, and approved May 5, 1924, by the Department of the Interior, * * * showing the lines of the right of way of the original location and completed portions and partially completed portions of the Laramie Ditches and Feeders.

"Referring to the later map, * * * it shows that the West Side Collection Ditch, and the East Side Collection Ditch both come to the West Portal of the Tunnel.

"Between the two maps the actually constructed location of the tunnel line was changed, so that the west end was thrown to the south, and changed its length from something over 15,000 feet to something over 11,000 feet." (Note: The tunnel bore was completed in 1914 or earlier.)

"This second map of the amended survey, partially completed portions of the Laramie Tunnel, Ditches and Feeders, shows what were the completed portions up to 1917. * * * Where it is completed, it is designated by a double line, one of which is the location of the ditch, and the other solid line to designate completed portions.

"There has been no change in the projected collecting means of the Laramie-Poudre project of the Laramie River. Had the Tunnel Reservoir been built, the system, with the reservoir, would take more water from Wyoming than does the present system, on account of the evaporation from the surface of the reservoir. The reservoir covered about 200 acres, and the evaporation off that reservoir would be much greater than it is in the three-quarters of a mile of ditch that was necessary to take the water around and through the tunnel or reservoir site to the Laramie-Poudre Tunnel" (R. 475-476).

If corroboration of continuity of purpose from 1914 were needed, these maps show that during the years 1916 the survey for it was made and in 1917 the amended map was filed to correctly show and obtain approval of right of way for the completed portions as the tunnel and collection ditches had been partially constructed and were then intended to be completed.

Meeker, Wyoming's expert witness in this, and the former suit, here testified relative to the unity of the tunnel and collection ditches:

"The purpose of the West Side Ditch was to collect water and carry it to the tunnel. * * * Such canal could not be used for any other purpose. Whether there were a pond or reservoir across which the water would run to the tunnel, or whether it would run in an excavated conduit it would not

make any difference in the accomplishment of the purpose.

"The West Side Ditch was half finished in 1913 on practically the same line. It runs through the same small tunnels. It is rough mountain territory with considerable rock work" (R. 333-5, 323, 325).

"The decree of the United States Supreme Court awarded the amount of 15,500 acre feet annual diversion, through the tunnel. I presume that these two collection ditches were a part of that project, and were so noted upon the maps attached to and made a part of the bill of complaint and the answer in that original suit" (R. 334).

And, referring to the record in the former case at page 4361, there, printed page 1285, Meeker recalls that for that case he prepared a graph, Exhibit U-3, in which the Greeley-Poudre works were divided into three parts and he there stated, one of which, "the Laramie River system is indicated in green and is a collection system of canals and trans-mountain tunnels," and he then said "the Collection system of canals and trans-mountain tunnel is a third unit" (R. 334-335).

This suit was costly. It engaged the attention of the appropriators under it for nearly twelve years. It sought to restrain and enjoin the entire Laramie-Poudre project diversion. As soon as the ban of this suit was lifted and its affairs could be consequently readjusted, the construction was resumed on the tunnel project by the district farmers now as a mutual company. Other witnesses than Coy, skilled as engineers and as men well experienced in large irrigation construction and in reasonable prosecution of appropriations in Colorado and Wyoming, testified that the work of appropriation by the West Side Collection Ditch as part of the tunnel system was prosecuted with reasonable diligence in view of the obstacles met. (Stimson,

R. 469, Mosier, R. 540, O'Brien, R. 566, Smith, R. 548-551, Akin, R. 584-588, Moore, R. 588-591.)

Wyoming's brief, p. 25, states "the ditch was not constructed until 1931. There was no construction work between 1913 and 1930." This is not strictly true. Work was kept up on the tunnel project in 1914 and succeeding years, in a limited way, it is true, but after the decision work was continued with the same purpose as fast as obstacles could be cleared away. The purpose was never relinquished. Obtaining right of way was kept up during the litigation by amended maps for corrected right of way. Exhibit J, R. 1406, 475-476. (Approved May 5, 1924, held up until this litigation was decided.) Preparations were made in 1928 and actual construction began in a big way in 1929.

With necessity for substantial amount of water from the Laramie River, also a Colorado stream, costly and arduous diversion to be built, the farmers had to band together in a district first, a mutual irrigation company when the district was less able to accomplish a cooperative effort; they had to pool their efforts for irrigation of their new lands, they were handicapped by extraordinary obstacles of litigation attempting to restrain the diversion and obstacles of war and unprecedented agricultural depression. All these things enter into consideration of what is reasonable diligence. Must it be said it should have been accomplished sooner under the obstacles confronting the users—the farmers under it? Is such diligence elsewhere shown in either State in the same period, that the completion of the West Side Ditch must be condemned as not reasonably diligent?

The Court, 259 U. S. 419, 496, awarded specifically 15,500 acre feet as "subject to this junior appropriation in Colorado," "by means of or through the so-called Laramie-Poudre project." This was to the collection ditches and tunnel designated in the pleadings and evidence.

(6) AUTHORITIES IN SUPPORT OF DECREE AWARDED TO THE LARAMIE-POUDRE TUNNEL SYSTEM.

That the decree awarded the Laramie-Poudre Tunnel system in the Colorado Courts for its priority of appropriation is conditional is set up by Wyoming. This is no vice—the Colorado laws have long recognized conditional decrees of appropriation for water rights.

> Waterman v. Hughes, 33 Colo. 270, 80 Pac. 891.
> Water Supply and Storage Co. v. Larimer & Weld Irrigation Co., 24 Colo. 322, 51 Pac. 496.
> Confirmed by statute, Colorado Compiled Laws, Sec. 1798.

Litigation is one of the difficulties to be considered in judging reasonable diligence and is an element excusing what otherwise would be apparently delay. In re Water Rights Crabb Creek, 134 Wash. 7, 235 Pac. 37, 41-42.

Foreclosure and changes in ownership are vicissitudes to be given consideration. Trowel Co. v. Bijou, 65 Colo. 202, 208, 176 Pac. 292, 294.

The decree of 1922 recognized the tunnel project appropriation as dating from 1909, by doctrine of relation.

> "As between different appropriations from the same stream, the one first in time was deemed superior in right, and a completed appropriation was regarded as effective from the time the purpose to make it was definitely formed and actual work thereon was begun, provided the work was carried to completion with reasonable diligence." 259 U. S. 419-459.

The United States Supreme Court, 259 U. S. 419, 495, recognized that the pendency of the former suit had prevented completion.

B. The Laramie-Poudre Tunnel Diversion of 1926 Did Not Exceed Decree. The Records are Fair in Reporting Diversions.

The allegation of diversion of more than 15,500 acre feet in the year 1926 was not sustained.

Wyoming's brief, pp. 16, 17, tells the Court:

> "There can be no doubt that water was in the year 1926, being taken, without any record thereof being made, from the Laramie River to the Cache la Poudre River via the Laramie-Poudre Tunnel diversion, which together with the recorded flow, made a diversion for the year in excess of 15,500 acre feet."

And cites Wyoming witness Meeker. This is a positive statement. The same witness retracted it.

Meeker, on further review and searching cross-examination, after 140 pages of testimony, admitted, "after lunch" and testified, that he did not find a total tunnel diversion "reported and unreported," in excess of 15,128 acre feet for the year 1926 (Meeker, R. 371).

And as to diversion "without any record thereof being made" Meeker concedes it is not more than 1,230 acre feet, and adopts Freeman's estimate to get that much (R. 371). Freeman even conceded it might not be fair.

No excessive diversion by the tunnel is claimed for any other of the twenty years since the former trial.

Furthermore, as to 1926, as elsewhere discussed, Meeker to get even an approach to 15,000 acre feet, resorted not to the record of Water District No. 3 into which the water was discharged, the record of the Division Engineer, or the record of the irrigation company, but to an annual report of Water District 48 which he discredited,

which was not required by statute and to which Colorado objected, but on which Wyoming premises her argument in her brief, page 14.

The year 1926 was one of surplus flow in the Laramie River. It was 117% of its 22 year mean, based upon the year's record (Meeker, R. 910). No shortage in Wyoming on the Laramie is specified for that year.

The Laramie-Poudre Tunnel system in Colorado however did not make a diversion of even half of its permitted amount. By no construction could the contrary be a proven fact.

There was never any question that it had so neared the 15,500 acre feet that its diversions need be the occasion of close scrutiny, either during, or at the end of the season, insofar as violating the decree was endangered.

Its diversions under its appropriations could not be figured to exceed about 7,100 acre feet for the year, whether figured from the reports in the State Engineer's office, the Water Commissioners records, and the Irrigation Company records, plus an estimated flow, in the freezing midwinter, January and February of possibly (but not more than) 500 acre feet, offset by the amount it carried late in the season, to accommodate the Skyline Ditch.

The 1926 incident does not prove a suffered or threatened injury for inadequate records as complainant's brief argues, pp. 15-16. As to the amounts cited there as shown by the witnesses McAnelly, water commissioner of District 3, for diversion into the Poudre by the tunnel, 5,644 acre feet, and computed by engineers Patterson, 6,118 feet, and Tipton 6,060 acre feet, there is no considerable variance. These were figures from May 1 to the end of the season. McAnelly's figure is brought up to about 6,000 acre feet by the customary charge (5% of the amount diverted) for losses in carriage down to the users headgates on the

Poudre (R. 435). Nor did Tipton's figure differ, for the period from May 1, to the end of the 1926 figure, from the headgate man's report (R. 856). Nor, when the 490 acre feet carried for the Skyline late in the 1926 season is excluded, is there much variance in Smith's 7,100 acre feet figure from March 23. Neither excess diversion nor habitual inadequate records is thereby proven.

Wyoming brief, p. 14, rested the proof of 1926 excess diversions upon the Mosier report. We submit that the defendant's objection to the Mosier report, as not a record required to be kept under the laws of the State of Colorado, based on no measurements and so incompetent, is good (R. 165), and that the figure, used by Meeker, is proven mistaken, as hereinafter explained. Meeker admitted it was improbable, as elsewhere here shown.

The Colorado Compiled Laws, Sec. 1704, provide:

> "It shall be the duty of the water commissioner of the district in which the water is used to keep a record of the amount of water so turned into his district from any other district."

(1) WYOMING WITNESSES, ZIMMERMAN, FREEMAN, POWELL, DO NOT SHOW EXCESSIVE FLOWS UNRECORDED THROUGH TUNNEL.

Wyoming, in assailing the Laramie-Poudre Tunnel diversions and records, lays main stress on the testimony of her three witnesses Freeman, Powell and Zimmerman, emphasizing Zimmerman. It is said they corroborate each other in showing large and excessive unrecorded diversions carried from the Laramie through the tunnel. An examination of the record does not support this.

Miss Zimmerman testified she has been running a summer resort at Home Post Office in the Poudre Canon the past ten years; that she has been since 1923 promoting

a big reservoir in the Poudre, had done nothing more on its building than dig some test pits (R. 128). When on the witness stand the third time, at Cheyenne, she admits she had been trying to sell it to the ditch companies in Colorado directly interested in this suit. That in 1926 Stephen Corlett Downey of Laramie, Wyoming, was her attorney and she instructed him to write and caused him to send to the owners of the Laramie-Poudre Tunnel and to the Water Supply & Storage Company, owner of the Skyline Ditch, and to owners of other trans-mountain diversions the threat of stirring up interstate litigation unless she shall receive a settlement. (The letter, Exhibit X-3, printed at R. 1626-A.) This letter is significant in that it just preceded the action by Whiting, the new State Engineer of Wyoming. Then she says she is a volunteer witness, has attended the entire affair of these hearings in Cheyenne, Wyoming, Denver, Colorado, and Fort Collins, Colorado (about thirty days). "My sympathies are very much with Wyoming."

> "I knew that the Laramie-Poudre Company was applying for a loan from the Reconstruction Finance Corporation, and I made some effort to prevent that. I understand I have been successful." "Defendant's Exhibit Y-3 to L. C. Moore, President of the Laramie-Poudre is in my handwriting, and that is my signature; I wanted to show him I had something to do with preventing the company getting the Reconstruction Finance assistance" (R. 955-956) (Ex. Y-3 at R. 1626-D & -E).

Her zeal was productive of the threatened expensive litigation but disclosed no violation of the decree by Colorado or by the irrigation companies who had rejected her proposed sell out of her late reservoir "filing."

Miss Zimmerman had to admit she was "not an expert on water measurements. I just took Mr. Freeman's state-

ment for that. I did not measure" (R. 129, 130). She admits the West Side Ditch had been constructed in sections beginning in 1909 and before 1929 (R. 126) but has Rawah Creek come into the Laramie two miles below the tunnel, instead of its actual more than six miles (R. 1251).

Likewise, as to the West Side Ditch (R. 126) she stated the 1929 ditch was entirely independent of that of 1909, but further said she "did not know" the plans. "I assumed that was the object" (to get water to the tunnel). "I suppose the purpose of the dam below the tunnel dam across the valley of the Laramie River to force that water up to the mouth of the tunnel."

Her generalized statements, therefore, that 3,000 acre feet were brought over by the tunnel in 1926 unrecorded, that it is a common practice of the defendant to make no record of the early and late diversions, are equally biased, unreliable and corroborate no one.

Even Freeman, whom Miss Zimmerman had hired, testified that on reconsideration he would not estimate the "unrecorded" flow out of the tunnel at exceeding 1,230 feet to February 27. Then he admits (R. 155), from March 23 he had actual gauge readings, which he found reported in the State Engineer's office. This 1,230 acre feet unrecorded flow he assumed based on his 9 second foot measurement at the end of the warm part of a winter day, February 14, 1926. He concedes this would be higher than in some other part of the day (R. 154, 155). That might be the peak of the flow (R. 151). That there is a diurnal variation he concedes (R. 150). That the flow at that altitude and time would be highest in mid-afternoon (see witnesses Akin, R. 586, O'Brien 569, 570).

Freeman's evidence does not show any such flow unrecorded. He found a flow February 14. On February 27 he admits it was not flowing. On March 21 he found the

gates shut down and no water flowing in (R. 147). From March 23 he found the automatic records in the State Engineer's office. His estimate up to February 27 had been based on a measurement at the peak of the flow of a diurnal fluctuation in winter.

As to Powell, another employee of Miss Zimmerman, he stated (R. 159) he did not estimate the flow unrecorded prior to May 4, 1926. Between April 27 and May 4, 1926, he estimated 400 acre feet. Later (R. 159), Powell put this estimate at "between 300 and 400 acre feet." Meeker (R. 368, 370) later put it at 326 acre feet and testified the tunnel automatic register charts were on file at the State Engineer's office (R. 279).

Witness Patterson (R. 707), easily enough found these flow records in that office. It is submitted, therefore, that the testimony of the Wyoming witnesses, Zimmerman, Freeman, Powell, does not show "diversions largely in excess" of the permitted amounts, either in 1926, or any other year, that they are not based upon reliable measurements or estimates and are so general and erroneously premised as to furnish no reason to accept them instead of the Colorado Engineer's testimony that one-half the tunnel appropriation was diverted from the Laramie River in 1926. Wyoming has not been injured by any violation of the decree therein or a lack of fairly accurate record of the withdrawals from the Laramie into the Poudre by the tunnel.

(2) ANALYSIS OF TESTIMONY OF WYOMING'S WITNESS RESPECTING COLORADO'S MEASURING DEVICES AND RECORDS.

Ralph I. Meeker, Wyoming's expert, criticises Colorado measuring devices and records but his reasons are strained and his effort unnatural.

No Wyoming water official makes claim of inability to learn fairly closely from Colorado records in the State Engineer's office the amounts by which the 1926 Laramie flow was consumed in Colorado.

Wyoming's engineer witness, Freeman, found these records for 1926 (R. 155).

Meeker was disposed to hunt for things to criticise. It is not unnatural that he had a blind spot in the Colorado State Engineer's office, after he was hired by Wyoming in 1929.

Before he was hired by Wyoming and while he was under employment at State Engineer's office in Denver, in water study papers, for U. S., or for Colorado, Meeker, after 1926, easily found (R. 362, 363) and used, not the Mosier report, but the Division Engineer's records as a basis for extending on Water Supply paper 469 p. 24, the tunnel diversions for 1926.

Meeker (R. 279) testifies he has computed "from the chart records" (he found them on file in the Colorado State Engineer's office) "the quantity of water diverted, but unreported" for the period from May 1 to May 4, inclusive, 1926. He then gives this figure as 326 acre feet "unreported" by the water commissioner of District 3, *"But which is recorded on the automatic gauge height chart."* We submit that the report of the water commissioner of District No. 3, does not bear out the fact that the water from May 1 to May 4 is "unreported." It was the beginning of the irrigation season and it was averaged out for that week. Furthermore, Mr. Meeker (p. 268) had no difficulty in finding the record of it on the automatic gauge heighth chart in the State Engineer's office in Denver, so it cannot be said to be "unreported." Later (R. 369) Meeker testifies: "I determined 326 acre feet as the unreported water for the Laramie-Poudre tunnel for that year."

In testifying to the total reported diversions by the tunnel, Meeker then discards the records which he had always before been accepting, from 1926, that is the weekly records of delivery of water into District No. 3, and, in testifying to his computation for the purpose of this suit, jumps over to the annual report of Mosier, Commissioner of Water District No. 48. This he knew was not based on any measurements, inspections, or facilities for measurement within Water District No. 48. The tunnel diversion measurement is made by the tunnel caretaker, at the discharge end of the tunnel, which is in Water District No. 3. Meeker, instead, takes the estimate found in the Mosier annual report, 13,572 acre feet, and to this adds 326 acre feet. Then, to swell the sum, he adds another estimate not based on any measurements, but the estimates of Freeman. He scales the figure of "unreported" water down to 1,500 acre feet. Then he admits that although he visited the tunnel in 1926, he made no measurements, and (R. 370) admits it was improbable that 13,000 acre feet were diverted that season, but sums up that (R. 371) "I have the figures you requested before lunch. I find the flow through the tunnel in 1926 to be 15,128 acre feet. I arrived at that figure from Exhibit 3, water commissioner's report of District 48, March 1 to October 1, 13,572 acre feet—unreported, as reported by Meeker from the charts 326 acre feet; reported by Freeman 1,230 acre feet, January 1 to February 27. My unreported diversion of 326 acre feet covered the period of time from May 1st to May 4th. That could be a duplication of the 13,572 acre feet reported by Exhibit 3. I believe it would be under the circumstances—the fact that the water commissioner's report of District 48 covered the report of March 1 to October 1." So, at 15,128, he had overfigured by 326 acre feet. At R. 376 he concedes: "I found no diversion in excess of 15,000 acre feet through the tunnel."

To get his estimate of 15,128 acre feet total by the tunnel for 1926 (R. 373), the witness (so well familiar with Colorado irrigation offices) had to studiously avoid the records of its flow in the Division Engineer's office, the State Engineer's office, and in the office of the Laramie-Poudre Irrigation Company, the tunnel appropriator. He had to reject these and premise, instead, upon an annual report of the water commissioner of District 48 in Colorado who had no means to measure, never measured, or kept a record of the flow and made his report (not required by statute) on the obvious calculation mistake of an employee of the Laramie-Poudre Company.

This tunnel project appropriation was the subject of the former suit, and violation of the injunction of its decree was the main stated grounds of the present suit.

It is significant that after reviewing all the proof, Wyoming's brief, on page 19, is brought to take the position that "whether the actual amount of water diverted by the tunnel is more or less than 15,500 acre feet per annum is immaterial."

On redirect examination, in resting complainant's case in chief, witness Meeker testified regarding its exhibit, a paper (Ex. 86, R. 382), "It is not a form of report that I am familiar with and find in that office, just a blank sheet, with notations on it. This purports to be in August, to show the diversion of August 27th, 1931, through the Laramie-Poudre Tunnel, and also Lost Lake. This piece of paper shows Laramie-Poudre Tunnel, 1,641 second feet for twenty-four hours, Lost Lake, 50.7 second feet for twenty-four hours" (R. 382-384).

Then followed several pages of examination regarding this blank sheet of paper by which it was elicited, only after considerable parrying, (R. 385) that it was nothing but a memorandum which inadvertently had gotten into the State Engineer's office and in which the decimal point had been

omitted, so that 1,641 second feet, he would have given the impression to the Court, was diverted through the tunnel. He knew that was an impossible amount (R. 389) and by all other records knew the figure intended was 16.41 second feet. In a case where one State is invoking the attention of the Supreme Court in a suit against another, where experts are testifying who are well familiar with the records of the State Engineer's office of Colorado and of the Water Commissioners, it should not have required so much labor (R. 382-389).

(3) THE VARIATION BETWEEN THE STATE ENGINEER'S REPORTED VOLUME AND THE ACTUAL VOLUME DIVERTED BY THE LARAMIE-POUDRE TUNNEL IN 1926 DID NOT INJURE OR MISLEAD WYOMING.

The amount which flowed out of it was figured by G. F. Smith as 7,100 acre feet under Duvall's weekly report to the Company (Ex. T, R. 1467-1470).

Meeker admits 490 acre feet of this 7,100 were waters of the Water Supply and Storage Company run through the tunnel in late August and September, 1926, under a special agreement for that year at the time the Skyline ditch broke and was disabled, and was done only as a special accommodation (Smith, R. 552, Kluver, R. 606). That subtracted from 7,100, leaves 6,270 acre feet. A close check. Meeker, Wyoming witness, assumed that no record was kept of these diversions. Meeker finally concluded that the unrecorded portion was only from May 1 to May 5, and that 326 feet should be added to the State Engineer's records on that account. But this 326 feet was reported to the Laramie-Poudre Irrigation Company corporate successor of the District (Ex. T, R. 1408).

It is to be borne in mind, as pointed out by witness Patterson (R. 700-703) that in the Colorado water administration there are two records kept, both available to inquirers. One goes to the State Engineer, through the

local water commissioner, and the Division Engineer. The other is the record which the Irrigation District or Ditch Company itself has, through its headgate man.

Freeman testifies that he found the flow after March 23, records in the State Engineer's office (R. 155).

Any earlier flow was a relatively insignificant amount of water. Up to May 1, for the water commissioner, it was too small an amount to redivert in the canals from Poudre to the Irrigation Company. The records of the Laramie-Poudre Irrigation Company here introduced (Ex. T, R. 1467), showed that there was the amount of 10 cubic feet of water per second reported as coming out of the east portal of the tunnel from March 24, 1926, to about the 10th day of April. Then it gradually increased to about 30 second feet the end of May, but decreased, with tunnel cavein trouble and repairs to nothing July 3. Then it ran up to 60 feet about July 10, then began a gradual decline to 11 feet, the middle of August. The Skyline water then raised it again. This water was not "unreported." It was a matter of record in the State Engineer's office, the Division Engineer's office, as well as in the office of the irrigation company at Greeley.

The afternoon flow of February 14, 1926, when Freeman was there with Miss Zimmerman, 9 second feet was not proven to have all been water taken into the upper or west end of the tunnel. This water was that issuing from the east portal of the tunnel. The tunnel is two and a quarter miles long. From the swamp above it, and from accretion along its course, it collects a small amount of water from seepage which varies from three feet down to a fraction of a foot (Stimson, R. 468, Turner, R. 561, O'Brien, R. 569). So far as Wyoming has been concerned all this, the seepage from the Poudre watershed as well, has been charged to the Tunnel-Laramie River appropriation.

It is true that nine second feet of water which Wyoming's witnesses Zimmerman and Freeman say was coming out of the east portal of the tunnel, if it were constant, would make up an amount of about 1,000 acre feet in 1926 from January 1 to February 28. But it was not constant, nor at that rate of flow, nor all from the Laramie River. To assume half of that as an average flow would be liberal.

The tunnel flow was not continuous in the winter and spring of 1926. Freeman testified that he went up there on March 21, 1926, and nothing was running through (R. 152), and that there was no discharge from February 28 to March 23 (R. 155). The whole estimate of nine second feet was based on a measurement made by Freeman about 3:30 in a February afternoon. That would be at the highest point of thawing for that day in the cold winter months of that altitude, and is not proof of a nine second foot average flow night and day for every day in January, February, early March at 8,500 feet altitude.

The seepage in spring and summer months from the Cache la Poudre watershed, charged to the Tunnel as if coming from the Laramie, could be expected to offset this part of the inconsiderable, variable, winter flow from the Laramie which, in that year 1926, was not reported to the State Engineer.

The mistake in Mosier's annual report for 1926 does not show habitual unreported diversions. Clem Duvall was the caretaker of the Laramie-Poudre tunnel in 1925 and for some years previous. He died in 1925. His son, J. H. Duvall, finished out that year to December 10, 1925. His employment ceased then. It began again in March, 1926, and then ended. Mr. Parker, now deceased, then President of the Laramie-Poudre Irrigation Company was the officer who administered the water collection and distribution. Smith had nothing to do with making or keeping a record of water through the tunnel (Smith, R. 551-

553). 1925 was the mutual irrigation company's first year on the tunnel. The younger Duvall seems to have failed up to May 1, 1926, to send the daily and weekly reports of the twice daily readings of the tunnel flows to the District 3 Water Commissioner, although he did to the company. Colorado did not have a report of the early spring and midwinter flow of 1926 for the tunnel in her State Engineer's office it is true. But it was neither with design, nor with effect, to injure Wyoming.

As the statutes of Colorado required (Compiled Laws of Colorado, 1921, Sec. 1704), the records of its discharge were kept under the supervision of McAnelly, the commissioner of Water District No. 3. Mosier, the commissioner of Water District No. 48, therefore did not need to keep it and did not do so, but at the end of the season wrote G. F. Smith, secretary of the Laramie-Poudre Irrigation Company, asking the amount of the total diversion. Smith's wife had died just two weeks before and Smith was indisposed (Smith, R. 554, 556). He wrote Mosier what Duvall's weekly record showed, but in the calculation had made a mistake, not only in computation, but it appears the Duvall reports were duplicated for some days (Smith, R. 556, Ex. T, R. 1470). Smith suggested Mosier check up through McAnelly. Mosier sent in the Smith figures in his annual report to the State Engineer, without verifying them (Mosier, R. 542). Duvall could not be found at the time of the hearing, although diligent inquiry had been made (R. 552, 569, 543).

On this clerical mistake Wyoming's witness Meeker has seized. Meeker does not state that there were actually 15,500 acre feet or more diverted either by daily, or weekly records, or gauge register charts, or any estimate of flow based upon actual facts. When that question is put to him he makes an equivocal answer that he is going upon the statement of the Water District 48 annual report. This mistake was made the basis of this suit to enforce

the decree. It was refuted by the records of the State Engineer and of the Laramie-Poudre Company itself, readily ascertainable to any investigator. Such a slip, out of nearly twenty years under consideration, should not warrant the federal government stepping in to brush aside the State authorities of the State in which the irrigation diversions are being made.

From May 1, Exhibit 22, page 1577, throughout 1926, the records of the company and of the Division Engineer and State Engineer's office check as is shown by the testimony of the witness Tipton and show about 6,100 acre feet (Exs. D-3, J-3, R. 1611, 1615). For Exhibit J-3 is added the full report of diversions as made by J. H. Duvall to the company, 7,125 acre feet as calculated by Tipton. Not over 500 acre feet should be added for the winter flows of January and February.

It is the practice to read the gauge at the tunnel outflow twice daily, to send daily reports by telephone and weekly reports each Saturday, to the District 3 water commissioner and when the flow and clock automatic register is able to function (after freezing conditions are over), the weekly gauge charts. These are checked against the daily reports and any errors are corrected (McAnelly, R. 435-437). This oversight of a new employee under a new administration was not continued, but was corrected as soon as the flow became substantial. Duvall was not continued as a caretaker.

There was no bad faith shown in this 1926 incident. We submit this 1926 inadvertence, after a criticism of the entire history and records of the tunnel diversions, under the experienced and searching scrutiny of the witness Meeker with all facilities made accessible to him everywhere he inquired in Colorado, does not disclose such an equity as should require what practically amounts to the appointment of a receiver of the appropriations from the

Laramie River in Colorado and the taking of their administration from the officials of this State.

C. The Laramie-Poudre Tunnel Weir is Standard Equipment and Reliable.

Complainant's brief devotes several pages to an attack upon the reliability of the tunnel weir. This weir is located at the discharge end of the Laramie-Poudre Tunnel. It was installed in 1927 as an improvement over the former standard weir which had been located at the same place. It is described in the record by Mr. Hinderlider (R. 808 and 809), by Parshall (R. 627 and 628); Potts (R. 745). And is illustrated in the United States Department of Agriculture Bulletin (R. 1068 and 1563, Ex. U-2). It is also exhibited by photographs (Ex. W-2, R. 1563-1569).

The outstanding characteristic of the Parshall-Venturi Flume is that it is so constructed that the flow of water is speeded up over the crest of the weir where the measurement is determined and thereby gravel, rock and debris do not lodge on the flume weir crest to prevent showing a measurement by automatic registering devices, within practical limits of accuracy (Stimson, R. 803; Parshall, R. 629; Potts, R. 747-757; House, R. 759; Tipton, R. 833-834; McAnelly, R. 866). All of these witnesses have made a study of the flume and its record and given their opinion that it does throughout a season show the measurement of the water within practical limits of accuracy.

For its criticism of this weir the complainant relies upon the testimony of Meeker. We have shown elsewhere he was inclined to close his eyes to available facts. He was also inclined to assume that gravel lodges on the crest in the throat of the weir. Gravel may lodge at the entrance of the throat, but it does not lodge on the crest of this weir. It does not prevent the flume from showing a

measurement within practical limits of accuracy (Parshall, R. 629, 630, 633; Stimson, 803; Potts, 747; House, 759; Tipton, 833, 834, 838, and photos, Ex. W-2). This, though a good current meter measurement might not be made (Parshall, R. 629).

The witnesses uniformly testified that a right angle bend in the outlet flume, is enforced by the steep mountain side there. This breaks the swift flow of the water as it issued from the lower end of the tunnel. The breaking of the speed of the water does cause rock and gravel to deposit in front of the weir or at the throat, at small flows, yet this gravel does not lodge on the crest of the weir itself. Furthermore, the presence of rock or gravel in the crest of the weir would have the effect of tending to cause the registering device to over-state rather than to under-state, the number of cubic feet of water flowing through the weir (House, R. 840). It is obvious that such material would interfere with the flow of water and cause an apparent water level height in the box of the registering device which would not be flowing water, but would rather be an impediment to flowing water. The weir assumes that the water is in motion going over its crest. The right angle turn in the weir constitutes a wide stilling basin for slowing down the flow of the water as it drops out of the tunnel mouth. This tends to even up the velocity and depth as the water enters the narrowing throat of the Venturi weir. It is an improvement over the former weir and made for the purpose of accurately measuring the water there.

It is to be observed here that the Laramie-Poudre Tunnel current meter check measurements prior to the year 1927, pointed out by Meeker (R. 269, 270, 346, complainant's brief, p. 18), are those of a flume which has been supplanted by the new improved Venturi weir (Ex. 59, R. 1071). The Baily test of May 24, 1927, was of the new weir freshly installed before it had been corrected by

adjustment. They should not have weight here in discredit of the present weir.

In the case in chief there was testimony by Meeker, after Drummond was excused as a witness, that Drummond, Wyoming's Deputy State Engineer, had made a current meter check at the east portal of the tunnel at 5:30 P. M. on July 11, 1929. The record of it was not there introduced nor was Drummond asked by Wyoming to disclose its details while he was on the witness stand. It was first offered in evidence on rebuttal, and would appear to reflect upon the weir. But a search back through the records shows that (R. 341, 342) Meeker testified to the fact, but not the result, of a current meter measurement by Drummond at the East or discharge end of the tunnel on July 11, 1929 (R. 342). Meeker said: "His measurement was made above the right angle turn in the expanded channel from the outlet tunnel." Obviously this was a turbulent and unfair place near to this drop from the tunnel mouth. It must have been the same current meter record so, on the last day, offered as complainant's Exhibit 92 (R. 1206-C). There was no opportunity to cross-examine on it.

The criticisms by Meeker of the record flow of the tunnel through the automatic register devices as compared with checks by current meter tests do not disprove that Wyoming is being given full credit for all water from the Laramie-Poudre passing through the tunnel. Allowances of from five per cent to ten per cent are to be made for differences in human variations and mechanical variations in making such tests (R. 272, 840).

Wyoming's brief quotes a memorandum by Parshall it introduced on rebuttal, which had been transmitted about April 14, 1933, in some letter mailed by another writer. It was not shown this memorandum was made on that date. There was no opportunity to explain it,

but it is to be observed that this memorandum which is Exhibit 97 (R. 1209) was based only on eight current meter ratings. The latest of these was July 10, 1932. Thereafter and before he testified in June, 1933, Mr. Parshall (R. 635, Ex. E) had the opportunity to study the performance of this weir measurement by 24 current meter rating tests. These he had studied closely and correlated and he thereon confirmed the several other engineering experts who had testified that the Laramie-Poudre Tunnel weir installed in 1927, reasonably and accurately records the amount of water passing through. At record, page 634, after having discussed the different meter ratings and the things which explain the deviations of some he states:

> "In my opinion taking it throughout the season, I am absolutely convinced that the flume installed at the outlet of the Laramie-Poudre Tunnel operates well within the practical limits of accuracy even though it is hampered by debris from the channel."

As to the Laramie-Poudre Tunnel Venturi flume, Meeker concedes (R. 281): "While the improved Venturi flume is an excellent measuring device, the conditions upon which it has been installed and operated are such as to destroy its accuracy in recording diversions of water from the Laramie River." Elsewhere he conceded that out of a total of thirteen checks against it by current meter measurements it showed a deviation of only 1.5% in what it was recording as against the current meter tests of what was flowing through. His criticism of it was not borne out by the records of the average of the current meter tests against which it is checked.

Wyoming introduced Meeker's compiled table of tunnel weir variances between current meter tests and recorded flow (Ex. 30). The thirteen tests by current meter, he admits (R. 350-351), show more was recorded and charged to Colorado than actually went through. The

current meter tests showed 318.68, while the weir registered 328.68 acre feet as gone through. The variation was only 1.5% between the two methods. That was fairly close. But it demonstrated that, as an average, the current meter test against the tunnel record of flows based on the Parshall flume rating does not prove the actual flow exceeds the recorded flow, but the contrary (R. 351). He has already admitted that a five per cent variation on such tests is considered permissible (R. 343).

(1) THE PROPER PLACE TO ASCERTAIN DIVERSIONS FROM THE LARAMIE IN COLORADO WAS NOT THE ANNUAL REPORT OF WATER DISTRICT 48 BUT THE DIVISION ENGINEER'S WEEKLY REPORT.

Meeker testifies, summing up on direct examination by Wyoming, after a lengthy reiterative quoting from the books of the local commissioner of Water District 48 annual reports:

> "As indicated by the frequent references to the various field books, observations by the water commissioner in no instance, as I recall, exceeded ten visits per year and frequently fell as low as two or three visits. For this reason, the accurate determination of the amount of water diverted is not reflected in the records of the water commissioner because of his infrequent visits" (R. 317).

The tabulated annual report as Exhibit 3 (R. 974) was simply a columnar digest of the matter in the field books. These District 48 water commissioner's records were incomplete, generally made from hearsay. They misled no one.

Mr. Meeker well knew, from long experience in the office of the State Engineer of Colorado, that the daily record and register of water by scientific instruments and daily observation and report, was of water diverted out of the Laramie and into Water District 3, not measured daily on the Laramie side of the diversion by the commis-

sioner of Water District No. 48, but that such measure was always made on the discharge side, under the commissioner of Water District No. 3. It is he who must distribute it all and who must and under C. L. 1704, report weekly to the Division Engineer. He did require a daily record and made weekly report. Mr. Meeker had no difficulty in finding the weekly and annual reports thereof in the office of the Division Engineer and of the State Engineer in the State Capitol in Denver. He had used them years before (R. 362, 363), and in then making an extension on water supply paper 469, page 240, of the flows of the Laramie-Poudre Tunnel for the years 1922 to 1927 inclusive, had in his own handwriting entered and used these records of the Division Engineer, so made from the weekly reports from the District No. 3 (R. 363). It did not occur to Meeker then to look for it in the annual report of the commissioner of Water District 48. He testifies the District 48 commissioner's field book did not purport to show visits to the tunnel nor tunnel diversions (R. 348, 362).

Meeker knew the commissioner of District 48 did not measure, and in many years had not measured, the tunnel water, or attempted any daily record of it and that the District 48 annual report showed this. He did not make weekly reports (R. 372) on the tunnel. He knew that the commissioner of District 3 kept a daily reported record which he checked weekly against the automatic register sheets.

The tunnel weir at the east portal is at the only practicable location (R. 808). It is on a prominent highway over the Rockies, the "Cameron Pass" Highway (R. 559, 560), and so is very accessible—more so than if located at the West portal, at the upper end of the Laramie Valley. It is out of the mountain up a somewhat steep trail from the tunnel caretaker's house along the highway (Drummond, R. 179).

The water comes out of the tunnel at high velocity and is turned into "Tunnel Creek" with a right angle turn and an expanded basin which is to quiet down the turbulency and even its flow (Patterson, R. 739). There the commissioner of Water District 3 is the one who must measure and must keep a record of its flow. It is the better place to get an accurate measurement. The Laramie River end, through the mountain, has not a better and more dependable location for a measuring weir (Patterson, R. 740; Potts, R. 751). At the East Portal are the most approved and recent form of measuring flume—the Parshall Venturi—and two gauges, one the customary staff rod, for all seasons, and also the approved clock mechanism of an automatic register. This clock register is kept locked because it has been tampered with by meddlers (R. 569, 560). Anyone having business with the flume or gauging devices can make known his business at the caretaker's house at the road below and permission is freely given (R. 559).

(2) WYOMING'S REPRESENTATIVES HAVE HAD FULL ACCESS FOR INSPECTION OF THE TUNNEL MEASURING DEVICES AND RECORDS.

On page 17 of the complainant's brief the statement is made that "Wyoming's representative Mr. Drummond was not permitted to inspect the automatic gauge." This might be misleading.

Drummond testified (R. 171), he visited the East portal of tunnel July 17, 1929. That before Drummond had disclosed his business, Luce, caretaker, came up, Drummond paid no attention to him but went on with his measurement (hardly a good start for courtesy). When he was leaving, Luce ordered him off, and thereupon first learned Drummond was investigating for Wyoming. Then Luce called the superintendent of the Tunnel System, O'Brien. O'Brien that evening told Drummond he had

no objection to his measuring the water. Drummond came back again that day and the next (R. 171). On cross-examination Drummond admitted (R. 179-180), "It was a steep climb up to the tunnel East portal * * * I could see there was a house there that apparently belonged to the tunnel. I did not make my business known before I went up there, because I could save twenty or thirty feet of climbing by starting in up at the bridge. I was never refused permission to go up there. That evening when I called up Mr. O'Brien (superintendent) he told me to make all the measurements I wanted. * * * Two days after that the Assistant Attorney General of Colorado informed me that I could make any measurements of any ditch or stream I wanted to make in Colorado." It was a trifling incident, immediately rectified.

The record in fact shows that all of the Wyoming engineers and witnesses, Watson, Whiting, Drummond, Meeker, had the fullest opportunities to measure and check and investigate at the Colorado diversions on the Laramie River, and that they freely did so. Wyoming's representatives also have had the freest access to the records in the Colorado State Engineer's office and anywhere else they sought information. There is no contradiction of this. Meeker (R. 341) says:

> "I have at all times had free access to ascertain whatever information I wanted and measurements from the Colorado authorities."

The automatic register charts of the tunnel were on file in the State Engineer's office and different engineers investigating found them there (Meeker, R. 279; Potts, 749; House, 760; Tipton, 836-838, 848). Freeman found the records of these flows from March 24, 1926 (R. 155).

(8) THE COLORADO APPROPRIATORS FOR TRANS-MOUNTAIN SYSTEMS DO NOT UNDERSTATE THEIR DIVERSIONS.

Wyoming's brief argues, pp. 48, 49, as to these trans-mountain diversions into the Poudre, that the daily records are kept only by the appropriators themselves, that the appropriators are in charge of the diversion works. "There is no water official to be watched, because none come more than three or four times in a season, and then only to make observations."

But it is to be remembered that the water commissioner of the Poudre has the turning out of this water at the headgates therefrom to the lands of the appropriators. He must know his water receipts, he is the one charged by statute with making the record of it (C. L. 1704), and must make his "bank account" of water balance. He has daily telephone reports from each trans-mountain diversion measuring weir, and weekly gets the telltale automatic chart register sheet against which, and the water he has had available for delivery to the contending Poudre ditches, he can check the fidelity of the man at the trans-mountain weir discharging into the Poudre.

Since the water user is entitled to redivert from the Poudre only what he shows put in, it is to the self-interest of the trans-mountain water appropriator not to understate to the water authorities, but rather to stoutly claim all he may as having been diverted from the Laramie and put into the Poudre. This is not to Wyoming's disadvantage.

Wyoming's counsel in her brief recite and argue at page 49:

> "Because all of the unrecorded water—more than 3,000 acre feet in 1926, as Mr. McAnelly stated to Mr. Freeman (R. 148)—would be made available for use of these Cache la Poudre appropriators and they would only be interested in being protected

from excess diversions in the Cache la Poudre over what the record shows was diverted from the Laramie."

This argument is unsound. McAnelly did not state to Freeman that there were more than 3,000 acre feet of unrecorded water in 1926. Not even Freeman so stated it. Freeman's talks with McAnelly were but two. Both were in 1926, one in February, one in May—both so early as to refute such a statement attributed to McAnelly. Freeman's estimate of unrecorded water was 2,500 acre feet (R. 155). He admits he based his estimate upon (1) from January 1 to March 23 "the off season" a measurement of this diurnally fluctuating stream in winter—that was taken at 3:45 in the afternoon of February 14, the high point of the day; (2) from March 23 to May 5, upon automatic gauge charts (not unrecorded, however he may so designate it). He found the automatic gauge charts in the Division Engineer's office (R. 155). This was not the "off" season. It was the "on" season. Freeman says also, "I saw the gauge charts for 1926—they seemed to be kept in very good condition. I think, insofar as I could tell, the record of the gauge charts were quite accurate" (R. 149). He qualifies then, "It is recorded, but is not included in the official reports" (R. 155).

There was a good reason why there were no gauge charts for the "off" season—that up to March 23. Freeman says he was there March 21, and no water was running (R. 147). Ice conditions, also, in winter time at those altitudes prevent the operation of automatic registering devices because such instruments depend on the free action of a float which winter conditions make impractical, and as the witness Meeker admitted, such winter records are not dependable (R. 337).

The absence of "meter" measurements prior to May 25 or late in September, argued at page 20 of complain-

ant's brief, prove nothing. The flows are small outside of those dates and meter tests are not significant. To find the flume free from ice at that season, says Freeman, would be unusual (R. 150). But he assumed an even flow of the amount he found running at the end of warm part of a winter afternoon. He concedes, finally (R. 155, 156), it might not be fair. That such time of day in February would be the peak, not average flow were: witnesses O'Brien (R. 569, 570), Akin (R. 586), Turner (R. 561).

Measuring devices do not operate in winter weather in high altitudes. There are very few records of those high altitude water flows during winter months. Meeker testifies to this (R. 337, fol. 508). They tend to be grossly excessive. Ice conditions make use of measuring devices inexact while cold weather there continues. This is natural. Neither float gauges nor even staff gauges are freely then operative. Ice conditions tend to exaggerate gauge heights. But the flow is slight in such seasons and not of great consequence. Zimmerman found ice in the weir April 9, 1933 (R. 954, 955), when O'Brien, for the Laramie-Poudre (R. 569) was flushing out its intake.

Meeker, on Easter Sunday, April 16, 1933, found only 3.83 second feet running through the tunnel (R. 336-7 363). How much of this was seepage along its course is not shown. The reliance on the Baily measurement, Ex. No. 59 (R. 1071), cited by complainant's brief pages 20 and 21 does not refute Hinderlider. It was a current meter test of the new weir made when it was freshly installed, May 24, 1927, and before it had been corrected by adjustment.

VI.

The Meadow Land Diversions are Not Excessive and the Administration Thereof is Fair and Without Injury to Wyoming Appropriators.

Certain phases of this subject matter are discussed under Point IV of this brief, in connection with another proposition, and the purpose of the discussion here is to answer, somewhat in detail, the contentions urged under Point III of complainant's brief.

There were approximately seventy ditches in Colorado for irrigation of meadow lands along and close to the main stream and tributaries of the Laramie in Laramie River Valley in Colorado, as decreed priorities for irrigation therein prior to October, 1909 (R. 1220-1401. Tabulated at R. 1237-1241, 1278, 1364). In the opinion herein, 259 U. S. 419, the Court did not segregate, nor in the decree, 260 U. S. 1, itemize, the recognized amount of each of these many diversions. It was not necessary.

The use was limited to 4,250 acre feet. The Court, in the opinion, 259 U. S. 419, and in the opinion on motion to dismiss, 286 U. S. 494, cited this amount as that stated by Colorado's State Engineer, Field in the former case as the amount used. Mr. Field's testimony so referred to, was (transcript of record there, p. 1097):

> "It may be that the water is turned onto those meadows to the depth of 12 feet in the course of a season, but the consumptive use could not possibly exceed one acre foot per acre."

Plainly, the 4,250 acre feet recognized in the decree refers to the *consumptive* use, or amount withheld by Colorado by the meadow land irrigation, employed by the Court in determining the available supply in the river when existing prior uses were recognized as having been already diverted and having depleted the river at the

State line when the total remaining available supply of 288,000 acre feet was determined.

The method of irrigation of the meadows is by flooding hay fields throughout the growing season, whereby the water returns quickly to the stream. The same method of irrigation that the witnesses for Wyoming testify is employed in good husbandry in both states. Watson (R. 191 and 192), Meeker (R. 347), Akin (R. 586), Patterson (R. 728, 732), Potts R. 774). Complainant's brief, p. 29, admits this is the proper method for irrigating meadow lands.

Both states accept the figure of one acre foot per acre as the consumptive use by such irrigation of each acre of meadow lands in Colorado and those above the Wheatland Reservoir in Wyoming. (Meeker, R. 348.) Meeker has compiled a careful water supply paper arriving at this determination which is discussed by Downing (R. 453), and is shown as the defendant's Exhibit Q (R. 1463).

The acreage of meadows irrigated in the Laramie Valley in Colorado has not been increased since 1914. There was then 4,250 acres. Whiting, Wyoming State Engineer (R. 219), testified there is now approximately 4,200 acres. Watson, Wyoming's engineer witness, says his business from 1929 to 1933 on the Laramie River lands in Colorado "was to see what land was being irrigated" (R. 191).

Whiting testified that Drummond also made surveys of the irrigated lands under the meadow land ditches in the State of Colorado on the Laramie River and in this he was assisted by Henry G. Watson, Deputy State Engineer, and Earl Lloyd, First Assistant Engineer (R. 216). Whiting did not testify that the irrigated area exceeds 4,250 acres. Neither did Drummond. Meeker made the generalized statement that it exceeds 4,250 acres. On this Wyoming relies and not on the testimony of those who made the surveys for Wyoming. Meeker made no surveys of this

irrigated meadow land in Colorado. His testimony that it exceeds 4,250 acres was first given on rebuttal. He did not say by how many acres.

A very careful survey by Engineer Roderick L. Downing, Associate Professor of Engineering at the University of Colorado at Boulder, showed the actual acreage of irrigated meadow lands (R. 449), is the total of 4,234.5 acres which includes productive meadow, pasture meadow, and irrigated sage brush. This was portrayed on the map, defendant's Exhibit I, and the witness described in a very complete manner the nature of the meadow areas in Colorado on the slopes of mountain valleys of the head waters of the Laramie River.

The decree does not take from the meadow ditches senior to 1909 the appropriations they had been using by the method of constant meadow flooding accepted both in Colorado and Wyoming as good husbandry in raising wild hay in the Laramie watershed.

In arriving at the available supply of the Laramie River as 288,000 acre feet, it was found there had already been a river dimunition by the 4,250 acres of meadows irrigated in Colorado and their use of one acre foot per acre per year or 4,250 acre feet; that the Skyline Ditch use of 18,000 acre feet and the relatively small amount appropriated from Deadman Creek prior to 1902 by the Wilson Supply Ditch had already been taken out, because they were recognized senior appropriators. It was intended to recognize these senior appropriations in both States in determining how much was left for the appropriations of the Greeley-Poudre then being prosecuted, shortly designated in the decree as the Laramie-Poudre tunnel appropriation.

When the Supreme Court apportioned this water of the interstate stream between Wyoming and Colorado, it did not allocate, separately to each senior ditch in Colo-

rado and to each ditch in Wyoming so irrigating the meadows, a fixed amount. The Court allocated the 4,250 acre feet to the Colorado meadow ditches as a group. The 272,500 acre feet apportioned to senior Wyoming ditches was to them as a group. This apportionment to the Wyoming meadows and the Colorado meadows and the other Wyoming ditches was in recognition of their reasonable requirements. The Court said:

> "There are some existing Colorado appropriations having priorities entitling them to precedence over many of the Wyoming appropriations. These recognized Colorado appropriations are, 18,000 acre feet for what is known as the Skyline Ditch, and 4,250 acre feet for the irrigation of that number of acres of native-hay meadows in the Laramie Valley in Colorado, the 4,250 acre feet being what Colorado's chief witness testifies is reasonably required for the purpose, although a larger amount is claimed in the State's answer. These recognized Colorado appropriations, aggregating 22,250 acre feet, are not to be deducted from the 288,000 acre feet, that being the available supply after they are satisfied. Nor is Colorado's appropriation from Sand Creek to be deducted, that creek, as we have shown, not being a tributary of the Laramie." 259 U. S. 419, 490.

As to the needs or measure of the Wyoming senior appropriations, the Court said:

> "The evidence shows that the Wyoming appropriations having priorities senior to the one in Colorado, and which are dependent on the available supply before named, cover 181,500 acres of land, and that the amount of water appropriated and reasonably required for the irrigation of these lands is 272,500 acre feet. A much larger amount is claimed, but our finding restricts the amount to

what the evidence shows is reasonably required, which is 1 acre foot per acre for the larger part of the lands, 2 acre feet per acre for a part, and 2½ acre feet per acre for the remainder.

"As the available supply is 288,000 acre feet, and the amount covered by senior appropriations in Wyoming is 272,500 acre feet, there remains 15,500 acre feet which are subject to this junior appropriation in Colorado. The amount sought to be diverted and taken under it is much larger.

"A decree will accordingly be entered, enjoining the defendants from diverting or taking more than the 15,500 acre feet per year from the Laramie River by means of or through the so-called Laramie-Poudre project." 259 U. S. 419, 495.

The apportionment to the meadow lands in Colorado and to all the lands in Wyoming for senior appropriation was based upon the needs for irrigation of the acreage of the lands found to be irrigated by this group of ditches. The consumptive use was the measure. There were seventy meadow ditches in the mountain areas using from the Laramie in Colorado and as many in Wyoming including the tributaries. The Court did not determine the priority and amount of each of these meadow ditches in either state, but apportioned the amount upon the reasonable requirements of these lands in both states. The Court had before it and, of course, considered, in recognizing these Colorado meadow uses that water must, in growing season for sixty days be kept flowing constantly over the hay meadows and runs quickly back to the stream, due to the gravelly soil within the strips where it is applied, but the amount by which the river is depleted by such use is one acre foot per acre per year, by the then, testimony of the Colorado Engineer, Field, and then and now by Wyoming's expert Meeker. In determining the diminution of the river

at the State line by these Colorado uses one acre foot per acre, or 4,250 acre feet, was arrived at. It was not intended to compel a change in method of irrigation of meadow lands either in Wyoming or in Colorado, nor to deprive those senior meadow appropriations of the water they had been using according to the customary practices of hay culture in these high mountain valleys of the Laramie in Wyoming and in Colorado. Diminution of river supply by their use is what was being determined.

To restrict meadow ditch use to 4,250 acre feet headgate diversion, by the stoppage of this flowing of water across the meadows while the hay is being raised would dry them up and dry up the settlement under these seventy ditches and meadows in Colorado. The roots must be kept wet (R. 476-491, 495, 525, 530).

Because diminution of the river at the State line was the thing being complained against and for which injunction was sought, Wyoming pleaded in its Bill of Complaint in the former suit that more than seventy-five per cent of this water used on the meadow lands in the Laramie Valley in Colorado returns quickly to the stream, and distinguished it from the diversions being threatened by the works of the Greeley-Poudre Irrigation District which it named the West Side Ditch, the East Side Ditch and the tunnel, showing that these new threatened diversions would take the water out of the said watershed and drainage basin of said river, "where the said water cannot return to the said river" (Bill of Complaint in Record there, pages 8 and 9).

Reading the decree in the light of the record and opinion in the prior suit, it is submitted that this deduction of 4,250 acre feet for the meadows in determining the remaining supply, and this recognition of the 4,250 acre feet from the seventy meadow ditches without separate allocation to each, was to permit a diminution of the river to

that amount in irrigation of the meadows by these senior ditches according to the practices of husbandry on such mountain meadows along the river in Colorado as well as on the Laramie in Wyoming, and its tributaries, to-wit, constant flowage across them during the hay growing season to the extent of the consumptive use for 4,250 acres of meadows.

(1) ADMINISTRATION IN MEADOW WATER DISTRICTS IS THE SAME IN COLORADO AS IN WYOMING. MEEKER'S CRITICISM, AS SHOWING INFREQUENT VISITS, INEXACT ANNUAL REPORTS, OF DISTRICT 48 WATER COMMISSIONER IN COLORADO, NO MEASURING DEVICES ON THE MEADOW DITCHES, REPORT BASED ON NO MEASUREMENT DOES NOT SHOW VIOLATION. IN ABSENCE OF VIOLATION OF THE DECREE, WYOMING'S RIGHTS DO NOT NOW, ON THAT ACCOUNT, CALL FOR EQUITY TO INTERPOSE BETWEEN THE STATES.

There was not occasion for frequent visits to the heads of the ditches in Water District 48, on the Laramie River, nor for measurement or record thereof, by its local water commissioner, Mosier. Meeker testified (R. 304) from the District No. 48 Water Commissioner's annual field books:

> "I find, in studying the entries of the Water Commissioner to the various ditches, that they were visited infrequently."

But the evidence showed the Water Commissioner of a like district in Wyoming likewise visited the various ditches infrequently. Wyoming's Widman (R. 141) testified that as water commissioner and as deputy there for twelve years he had made but five visits up Sand Creek. The reason is that in both States there has not been occasion to visit the meadow ditch headgates frequently. The priorities are defined. The consumptive use of water is well known and accepted to be not over one acre foot per acre per year. The water returns from ditch to lower ditch and is used over and over again within these narrow

mountain valleys of the Laramie, in Wyoming as well as in Colorado. Calibrated measuring devices and automatic registering instruments are not employed or occasioned in the areas involved in either state. There is no means for accurately measuring, in acre feet.

At the end of the year the District 48 Water Commissioner made up his field book as an annual report largely from his inquiries of ranchers and of their foreman, as his annual certificates showed. Much was tried to be made of these certificates, but Mr. Meeker and the Wyoming authorities well understood that method of administration obtained in both States.

Meeker also criticises the head works of the meadow ditches in Colorado (Ex. 72, R. 300-301). But his description shows they are no different than those used generally on the only Wyoming mountain meadow area here particularly discussed, the Sand Creek meadow ditches in Wyoming. Stimson described these (R. 789-791) and showed by photographs of them, Exhibits O-2, P-2, Q-2, R-2, S-2, T-2 (R. 1557-1562). That none had weirs, some had makeshift dams, some no headgate structures at all, or any appliances to regulate the water. This was not contradicted. Also, as to the method of administration and of keeping records of the flows in Wyoming in this similar area of meadow ditches, Stimson testified that it was no different than that practiced in the meadows of the Laramie in Colorado. Widman, the Water Commissioner in Wyoming, told him he had absolutely no way of telling the amount of water that had been diverted by these ditches from Sand Creek, that there was no record of diversions of water from Sand Creek. The State Engineer's office in Wyoming could not find for Stimson any record of diversion of water from Sand Creek in Wyoming (R. 791).

The headworks of these ditches are not, it is true, generally equipped with measuring devices. The ditches

are small, the means of the ranchers are likewise. The acreage of meadows irrigated in Colorado has not been increased. The average acreage irrigated by the seventy ditches is only about sixty acres each. The record shows the same condition obtains on the high mountain ranches in Wyoming. There is no occasion for refined measuring. The consumptive use is the important thing. The headgates of these ditches are no differently built or administered than those in Wyoming on the Laramie River meadows above Wheatland Reservoir, on the Little Laramie, and on Sand Creek. Local conditions and necessities in both States recognize this situation and method of husbandry.

The Colorado method on the meadow land ditches is no whit less scientific, less exact, worse or different than in the complainant's own meadow land appropriations. Imposition of costly meters and scientific registering devices would amount to confiscation to the ranchers in those valleys in both States.

As to the trans-mountain diversions, where the water is being taken out of the Laramie drainage basin, there are maintained, with constant caretakers, and vigilant surveillance, improved weirs to gauge and register the amounts of water taken, and the records thereof are kept by the Water Commissioner of District 3, as the Colorado law requires, and these records are available at his office at Fort Collins, at the State Engineer's office, in Denver, at the ditch companies' offices at Fort Collins and at Greeley.

VII.

The Skyline Ditch Appropriation.

The Skyline Ditch was the first trans-mountain diversion from the Laramie River to the Cache la Poudre River. It was constructed in 1891 to 1893 and water has been

diverted each year since the construction for use in irrigation of lands of the stockholders of the Water Supply and Storage Company, a mutual ditch company irrigating about 50,000 acres of land in Larimer and Weld Counties, Colorado. The water for the Skyline Ditch is taken from the West Fork of the Laramie River at an altitude of about 9,500 feet and carried back along the slope of the mountain to the south and emptied into the reservoir known as Chambers Lake. In its course the Skyline Ditch intercepts a number of small streams tributary to the West Fork of the Laramie, and the water so collected in the ditch throughout its length is measured at the lower end just before it enters Chambers Lake.

For many years, at least since 1899, the water diverted through and by means of the Skyline Ditch has been measured, and at the time of the hearing in the former case it was found and determined that the annual diversion had averaged approximately 18,000 acre feet and such was the finding of this Court in the opinion and decree (259 U. S. 419 at 490). The measurements of the water in this ditch were found in Exhibit 124 of the Record in that case. The copy of the Exhibit is found in the defendant's Exhibit L-3 (R. 1617), and are extended from 1913 to 1932, inclusive, by defendant's Exhibit M-3, page 1619 of the Record in this case, and the right of Colorado and the users of water under this appropriation was recognized and approved by this Court in that case to the extent of 18,000 acre feet per annum. This approval and finding was affirmed in the present case on motion to dismiss the opinion, which is found in 286 U. S. 494.

The amended bill in this case complains in the 12th subdivision (R. 37) that the State of Colorado permitted diversion through the Skyline Ditch of amounts of water in excess of 18,000 acre feet in three years, viz.: In 1927, 22,150 acre feet; in 1928, 19,397 acre feet; in 1929, 24,363 acre feet.

The answer of the defendant admits the diversion of the amount of water complained of in 1927 and 1928, but denies that the amount mentioned as having been diverted in 1929, but admits the diversion of 23,686 acre feet (R. 54). The answer then contains an allegation that no more than 37,750 acre feet have been diverted by means of all of the recognized appropriations of the State of Colorado, including the amounts mentioned as having been withheld by means of the Skyline Ditch.

When testimony was taken in this proceeding, the witness, R. I. Meeker, was asked with reference to the diversion through the Skyline Ditch in the year 1926, and the entire argument of complainant (subdivision IV of its brief, page 31), on the subject of the Skyline diversion is with reference to 1926 and an alleged "unreported" diversion through the Skyline Ditch in that year (R. 368) and which he found to be a total of 1,274 acre feet above the 18,000 acre feet allocated to the ditch, although the brief referred to fixes the volume of such unreported water to be 1,633 acre feet. We refer to the statement of Mr. Meeker, as follows: "As previously testified I determined that 19,274 acre feet were diverted by the Skyline Ditch during the year 1926" (R. 368). No other complaint is made for the entire period of 1922 to 1932, inclusive.

The explanation for the so-called "unreported" diversion is found in the testimony of the witness McAnelly, the Water Commissioner, who states (R. 614), "With reference to testimony for plaintiff that during the week of June 19 to 26 an average flow of 99 second feet through the Skyline Ditch was unreported by me as Water Commissioner when the automatic register sheets showed continuous diversion for that week, I will say that, as I recall, the year 1926 was one of a very heavy flow both on the Cache la Poudre side and on the Laramie River, and that the water was coming so fast on the Laramie side it was

impossible to keep it out of the ditch. The Company had endeavored to shut the water off and made no daily report of any diversion and it was not reported until the sheets came in and, in turn, they were sent to the State Engineer."

Mr. Meeker states that the diversion in 1926 was "unreported" and yet he found the record in the office of the State Engineer, the very place such records are supposed to be found. He reached his result by checking the amount shown on the weekly report of the Water Commissioner against the automatic register sheets, with the result that in one year out of eleven, he discovered an alleged error in those reports of 1,274 acre feet.

Some mention is made in the brief (p. 32) that the measuring device is not operated at all times when water is being taken from the Laramie River, and reference is made to the testimony of the witness Drummond, who says (R. 168) "that the only thing I did then (1928) was snowshoe to the Skyline Ditch and see whether they were operating. I found a channel about two feet wide cutting through the middle of the canal, a channel cut through the snow down to the bottom of the ditch. I presume you would call it opening the canal for the spring flow. There was very little water flowing at the time, and, as I observed, there was no record being made of that delivery of water." Only one answer can be made to such an argument, if such it be, and that is, that science has yet been unable to furnish a measuring device which will operate in freezing weather and which will measure water when it is frozen, as is the case in high altitudes in the early spring.

In the case of Wyoming v. Colorado, 259 U. S. 419, this Court found and determined that the Laramie River, with its tributaries, had a dependable flow of 288,000 acre feet per annum; that before making this figure there had been deducted 4,250 acre feet for use on the meadow lands

in Colorado and 18,000 acre feet used through the Skyline Ditch in Colorado; that the prior Wyoming appropriators were entitled to 272,500 acre feet of the total flow of 288,000 acre feet and that the Laramie-Poudre Tunnel works were entitled to not more than 15,500 acre feet, the amount remaining in the river.

The 288,000 acre feet in the river were found by the Court from a long time mean or average covering a period of many years flow, and the 18,000 acre feet to be deducted for use through the Skyline Ditch was arrived at in the same manner, that is, the average flow during a long period of time. The average at the State line on the Big Laramie must have been considered with reference to the deductions of the same years of the diversions by the Colorado ditch. Some years the run-off was heavy, some years it was small, but over the period from 1899 to 1913, inclusive, the flow was equalized and amounted to approximately 288,000 acre feet from all sources for use of the appropriators in Wyoming to the extent of 272,500 acre feet and of the Laramie-Poudre Tunnel works, 15,500 acre feet. To illustrate how nearly that average was to the correct amount, we wish to refer again to the defendant's Exhibit L-3 (R. 1617), which was Exhibit 124 in the former case, and to M-3 (R. 1619), which was Exhibit 124, carried down to and including 1932. From that table it is demonstrated that up to 1913, when the testimony in the former case was taken, the average for the fifteen years when records were available was 18,578 acre feet per annum. The next period, from 1914 to 1932, inclusive, the average diversion was 16,384 acre feet per annum; the annual diversion from 1922, the date of the decree in the former case, to 1932, inclusive, was 17,808 acre feet and the average or mean for the entire thirty-four years from 1899 to 1932 was 17,352 acre feet. This Exhibit also indicates that in the eleven-year period from 1922 to 1932 there were five years in which more than

18,000 acre feet were diverted through the Skyline Ditch, and in six years when the diversion was less than that amount, the low flow being in 1931, 13,659 acre feet, and the high being in 1929, when the diversion was 24,490 acre feet. It is interesting to note that the years of short flow and of excess flow of the Laramie River at the State line follow in approximately the same ratio.

Mr. Meeker's testimony (R. 368) shows the 1926 flow in the Skyline Ditch to have been 19,274 acre feet, while Mr. Tipton's statement (Ex. M-3, R. 1620) shows the diversion to have been 18,747 acre feet, a difference of 527 acre feet or about three per cent. Mr. Patterson, the other Colorado engineer, testified (R. 716) that he found the diversion for the same year to be 18,903 acre feet, a difference of 371 acre feet or about two per cent less than the amount found by Mr. Meeker. The Meeker's figures, as were those of Tipton and Patterson, were arrived at from investigation of the records found in the office of the State Engineer of Colorado. In passing, it may be well to note that the Meeker figures include 490 acre feet which he charged to the Skyline Ditch, and which he admitted (R. 376) were reported as diverted through the tunnel, and, therefore, a duplication. Even if we assume the Meeker figures of 19,274 acre feet for 1926 to be correct, the addition of the excess (527 acre feet more than the Tipton figures or 371 acre feet more than the Patterson figures), yet the average for the eleven-year period is under 18,000 acre feet.

If we must deal with averages in considering the share of the waters of the Laramie River allocated to the Wyoming users, we must do likewise in dealing with the measurements of Colorado's water.

Referring now to the total diversions by Colorado amounting, as this State claims, to 37,750 acre feet annually exclusive of the Sand Creek diversion or to 33,500

acre feet if we exclude both Sand Creek and the meadow lands. The years 1926 and 1929 are apparently the only years in the period from 1922 to 1932, inclusive, when there was a claimed diversion of more than 33,500 acre feet out of the valley of the Laramie River. This appears from Meeker's testimony (R. 376-378). He says: "The correct figure for 1926 is 36,758 acre feet of which 2,234 acre feet was through the Sand Creek System," thereby leaving a total of 34,524 acre feet by means of the two diversions mentioned. From this must also come the 490 acre feet of duplication (R. 376), leaving the grand total of 34,034 acre feet or an excess of 534 acre feet over the amount due Colorado by means of the two diversions and an amount less than two per cent above the total of 33,500 acre feet. This was in a year when there was a 17 per cent excess at the State line (R. 910). It will be noted that for 1926 (R. 371) the Meeker figures are not based on actual records, but are assumed by him, mainly from the erroneous Mosier report, and it has been fully demonstrated elsewhere in this brief, Point V, that the figure therein was due to a mistake and showed more than 5,000 acre feet in excess of the actual diversion through the Laramie-Poudre Tunnel. The only other year mentioned by Mr. Meeker which shows a total diversion in excess of 33,500 acre feet (the aggregate allotted to the Skyline Ditch and the Laramie-Poudre tunnel works) is in 1929. He says that (R. 381) the total of all trans-mountain diversions from the river, excluding the Sand Creek diversion for that year, amount to 35,522 acre feet. In the figure he included Lost Lake, Columbine and Bob Creek ditches. This amounts to an excess diversion in the year 1929 of 2,022 acre feet or approximately six per cent excess above the allocated amount to the two diversions mentioned. This was in a year of excess flow at the State line of approximately 23% (R. 910).

We therefore find that in two years out of eleven under consideration, Colorado has exceeded, as attempted

to be shown by complainant's witness Meeker, the amount awarded to the two diversions mentioned and taken an excess of 2,557 acre feet of the waters claimed by the State of Wyoming, an average over the period of considerable less than 1% per annum, and this figure on the measurements of the complainant's own engineer (R. 382). The figures of the engineer for the defendant show less than that amount.

On the other hand, the testimony of the engineer for the defendant (Tipton's Exhibit J-3, page 1615) shows the total Colorado trans-mountain diversion for the period of 1922 to 1932 (excluding only Sand Creek) to have been an average of 26,878 acre feet per annum or 80% of the total allotted to the two diversions mentioned.

Certainly the appeal of Wyoming for relief from substantial injury, or for protection against threatened invasion of its rights, falls far short of being proven by the "clear and convincing evidence" of either, as is required by this Court in controversies between states.

Some criticism is directed at the Skyline Ditch with regard to its measuring devices and the records kept in connection with its diversions. This is found on page 46 of the brief of complainant, and intimates that Mr. Tipton has arrived at a different result in his study of the 1926 diversions than did Mr. Meeker—a glance will show that the two engineers must have used the same records and in the same manner for the same result is reached, viz.: 1,623 feet variation between the commissioner's report and the automatic charts. Complaint is made that the charts are not complete and are read by inexperienced individuals employed by the diverting company. This statement is not in accordance with the fact. The Water Commissioner, an engineer, reads all charts and corrects his report during the ensuing week and sends the charts to the State En-

gineer, where they are again checked (McAnelly, R. 436). The measuring devices are standard and properly record the diversions (McAnelly, p. 685).

In this connection, it is a significant fact that the measurements and estimates by Meeker, and those of Tipton and Patterson, covering an eleven-year period, should be within 3% of each other. This is well within the reasonable limits of accuracy in the measurement of water—the United States Geological Survey declares that measurements within 5% are excellent (R. 840), and Mr. Meeker acknowledges such to be true.

VIII.

Bob Creek Ditch, Columbine Ditch and the Lost Lake System.

The Bob Creek Ditch diverts its supply of water from Bob Creek or Nunn Creek, and certain unnamed small tributaries of Nunn Creek along the course of the ditch.

The course of the ditch from its source or head is in a general southeasterly and easterly direction, discharging its waters into a tributary of Roaring Fork Creek, known as Tunnel Creek, and which Roaring Fork Creek in turn discharges its water into the main channel of the Cache la Poudre River.

It appears from the statement of claim that work commenced on Bob Creek Ditch by survey on the 24th day of September, 1897 (R. 1479, Testimony of E. J. Gregory, R. 619).

On the 17th day of October, 1898, a survey was commenced for the construction of an extension to the original project, known as Bob Creek Extension Ditch (Deft.'s Ex. Z, R. 1477), which last mentioned ditch discharges its

water into the head of the original Bob Creek Ditch across the channel of Bob Creek. The general course of the extension of Bob Creek Ditch is westerly and southwesterly, and extends from Bob Creek a distance of approximately 6,000 feet, the source of supply of the Extension Ditch being divers and sundry unnamed creeks tributary to Nunn Creek. John McNabb, defendant's witness, testified that the original project was completed in the year 1902, and the Extension in the year 1920. (Testimony John McNabb, Deft.'s witness (deceased), Deft.'s Ex. D-1, R. 1491). The total length of the Bob Creek Ditch, including the Extension, is 14,130 feet. Its maximum capacity is 50 to 60 cubic feet per second of time (R. 616, Deft.'s witness Burgis Coy).

An adjudication proceeding is now pending in the District Court of Larimer County, Colorado, wherein claims have been filed by the owner of Bob Creek and Columbine Ditches, to obtain a dating and adjudication. This adjudication has not proceeded to decree because of the pendency of the instant case (R. 618, testimony of defendant's witness, F. W. Stover).

Columbine Ditch diverts its supply of water from Columbine Creek, which is a tributary of Deadman Creek. Its general course is in a southerly direction and it is about 6,200 feet long, discharging its waters into the North Fork of the Cache la Poudre River. Its maximum capacity is 40 cubic feet per second (R. 616, Deft.'s witness, Burgis Coy). The Columbine Ditch was originally included as a part of the Sand Creek System, and was included within the 288 cubic feet of water per second of time adjudicated to that System, and was given the date of June 15, 1899, by the decree of the District Court of Larimer County (R. 1282).

On the 4th day of October, 1919, Roy A. Portner acquired the ditch by warranty deed from The Divide Ca-

nal & Reservoir Company, its then owner, that company, however, reserving its priority No. 38 for 288 cubic feet decreed to the Sand Creek Ditch system by the District Court of Larimer County, of October 11th, 1906 (R. 1473). Portner conveyed to the present owner, The Mountain & Plains Irrigation Company, on October 27, 1920. The original plan was to divert water from Deadman Creek into Sand Creek, and from Sand Creek by another ditch into Sheep Creek, then through Sheep Creek into the North Fork of the Cache la Poudre River, thence to the main stream of the Cache la Poudre. However, it was found that this project was not feasible. The ditch, as used by The Mountain & Plains Irrigation Company, diverted the water from a tributary of Nunn Creek, Columbine Creek, and drops the water directly into the North Fork of the Cache la Poudre River.

The head of the Bob Creek Ditch is approximately ten miles from the West Portal of the Laramie-Poudre Tunnel and is approximately twelve miles from the head of the Columbine Ditch to the West Portal of the tunnel (see map attached to Complaint).

The source of the water supply is in reality on a different watershed than the West Side Collection Ditch, the East Side Collection Ditch and the Skyline Ditch. The valley of the Laramie River lies between the Skyline Ditch, the West Side Collection Ditch and the Bob Creek and Columbine Ditches.

From the computation prepared by the defendant's witnesses, R. J. Tipton and C. L. Patterson (Ex. H-3, R. 1614) it appears that the following quantities of water were diverted for the years 1922 to 1932, inclusive:

Bob Creek Ditch:

1922	508	acre feet
1923	1095	" "
1924	00	" "
1925	738	" "
1926	00	" "
1927	1028	" "
1928	526	" "
1929	1143	" "
1930	631	" "
1931	633	" "
1932	822	" "

Columbine Ditch:

1922	180	acre feet
1923	329	" "
1924	00	" "
1925	257	" "
1926	00	" "
1927	371	" "
1928	369	" "
1929	585	" "
1930	158	" "
1931	210	" "
1932	174	" "

The mean or average diversion for the period from 1922 to 1932, inclusive, for Bob Creek Ditch was, therefore, 648 acre feet, and for a like period for Columbine Ditch, the average or mean diversion was 239 acre feet, or an average diversion for the two ditches of 887 acre feet per annum.

Having regard to the diversions through the Laramie-Poudre Tunnel and the Skyline Ditch, the diversions of Bob Creek and Columbine Ditches are relatively small and represent a slight average diminution of the waters of the Laramie River. The water produced by these ditches

is early, that is from about the 15th to 20th of May, and until the first of July (R. 608, testimony of defendant's witness, Roy A. Portner).

Colorado does not propose to permit further diversions of water through these ditches, if such diversions are "illegal" as characterized by Wyoming. After the decision of this Court, rendered May 31, 1932 (Wyoming v. Colorado, 286 U. S. 494) the State Engineer of the State of Colorado ordered the diversions through Bob Creek, Bob Creek Extension and Columbine Ditches stopped, and from and after the 17th of June, 1932, no diversions have been made through these ditches (R. 610, testimony of Deft.'s witness, Roy A. Portner).

It has been and is now the contention of Colorado that the relative rights between the citizens of this State in the appropriation and use of the waters of the Laramie River, are to be determined in the Courts and under the laws of the State of Colorado, subject, of course, to any limitation placed thereon by the judgments, opinions and decrees of this Court.

Snowfall in the mountains is temperamental. One year there may be an abundance of snow in the mountains to the west of the Laramie River, which will supply the West Side Collection Ditch and the Skyline Ditch, and little or no supply for Bob Creek, Columbine and Wilson Supply Ditches. Conversely, there may be an abundance of water supply above the creeks supplying Bob Creek, Columbine and Wilson Supply Ditches, and very little moisture to supply the Skyline and West Side Collection Ditches. In such a year neither the Laramie-Poudre nor the Skyline Ditch would obtain the 15,500 acre feet and the 18,000 acre feet allotted to them respectively, but the diversions for the benefit of the Poudre Valley could in such year nevertheless be increased somewhat by the use of the Bob Creek and Columbine Ditches.

If the aggregate amount available for the use of Colorado, 37,750 acre feet, is not exceeded by the use of any "works" constructed or under construction at the time of the hearing of the former case in this Court in 1914, it is respectfully submitted that Wyoming should not be heard to complain.

Again, let us assume that in a given year, the embankments of the West Side Collection Ditch break, and it is therefore unable to carry its allotted 15,500 acre feet, would it not be unfair to the users of water in Colorado to deprive them of the use of this water or some portion of it, if a like amount could be diverted through the Bob Creek or Columbine Ditches?

We submit that the water users of Colorado should not be made dependent entirely on the vagaries of nature. It is not at all unlikely that a cave-in will occur in the Laramie-Poudre Tunnel, and the 15,500 acre feet available to it could not be carried to the Cache la Poudre River. Similarly, under these circumstances, it would be inequitable to deny to the water users of the Poudre Valley such water as might be obtained through the existing works of the Columbine and Bob Creek Ditches.

Sometimes, for one reason or another, appropriations of water are abandoned. It seems to us that this Court did not intend to hold that in the event of the abandonment of all or any part of the 37,750 acre feet allotted to Colorado (as we see it) by the decree and opinion of this Court in 1922, that thereby all of the waters of the Laramie River would become available to the water users of Wyoming.

It is said of these diversions by Wyoming (p. 35, brief):

> "These diversions are illegal and in violation of the decree in the former suit, and are against the equitable rights of the State of Wyoming to appro-

> priate and use the water remaining after the recognized Colorado appropriations are satisfied,"

citing the opinion of this Court in Wyoming v. Colorado, 286 U. S. 501, 76 L. Ed. 1248.

Properly construed, we believe that the State of Colorado and the citizens within this State are limited in the "quantity of water" to be diverted within this State from the Laramie River. We do not believe this Court intended to determine the relative rights of Colorado appropriators in the waters of the Laramie River as between themselves.

At page 626 of the opinion in the above case, this Court said:

> "Construing the decree in the light of the record and opinion to which counsel for both States appeal, we think it is intended to and did define and limit the quantity of water which Colorado and her appropriators may divert from the interstate stream and its tributaries, and thus withhold from Wyoming and her appropriators."

The decree was intended to find and adjudicate the relative rights of the two States and the citizens of the two States as a class; that is to say, the determination by this Court that there was 18,000 acre feet, for example, available to the Water Supply & Storage Company for diversion into its Skyline Ditch, would not bar another appropriator in Colorado from showing in the Courts of Colorado that in fact a portion of the 18,000 acre feet allotted to the Water Supply & Storage Company was his by virtue of an earlier appropriation, or because of an abandonment by the Water Supply & Storage Company of a portion of its appropriation.

Wyoming takes a position in this connection which appears to us to be not only inequitable but untenable. If it is held that Wyoming's construction of the language

of the Court is the correct one, the result would be that no appropriator in Colorado junior to the appropriators named in the decree of this Court in 1922 (Wyoming v. Colorado, 259 U. S. 419) could ever acquire any rights to the use of water of the Laramie River, superior to appropriators of Wyoming, even though the appropriators in Wyoming might be many years junior to the Colorado junior appropriator. Such a construction would result in the Colorado junior appropriator being barred from the use of his appropriation without ever having had his "day in Court."

In Colorado and in Wyoming, under the doctrine of appropriation, the owner of a water right does not acquire an absolute title in the water. His property right is only insured by its use. It may be lost by non-use, and in such case, it is the law of both States that a junior appropriator applying such abandoned water to a beneficial use acquires the prior right to its use. If Wyoming's construction of the Court's decree is sustained, this doctrine of the law of appropriation in both of the litigant States will be entirely ignored. We do not believe that the asserted construction of Wyoming can be sustained under the decisions of this Court. Kentucky v. Indiana, 281 U. S. 163; 74 L. Ed. 797; Connecticut v. Massachusetts, 282 U. S. 660; 75 L. Ed. 602.

Referring to the Lost Lake System, the testimony introduced in the former case shows that this system was used and in operation at the time of taking the testimony in the first Wyoming-Colorado suit (R. 700, testimony of Deft.'s witness, John Armstrong, in former case).

While no mention was made of these small lakes in the opinion of the Court in Wyoming v. Colorado, 259 U. S. 468, the amount of water which had theretofore been stored, and used by means of this system must have been taken into consideration by the Court as one of the prior

Colorado appropriations, for the reason that the flow of the Laramie River, estimated at the State line to have been 288,000 acre feet was, after all of the prior appropriations had been taken by the Colorado users. It would seem, therefore, that the deduction of the small amount theretofore stored in the Lost Lake System never had reached the State line and the subsequent use by the appropriator did not constitute any additional drain on the river. It is true that no decreed priority has ever been granted by Colorado on these lakes. Defendant's witnesses, Rowe, Kluver and Edwards testified as to the construction and use since about 1891 (R. 598, 602, 622).

All that has been said with respect to the use by Colorado appropriators of the Columbine and Bob Creek Ditches, as a matter of construction of the decree of this Court, is also applicable with respect to the Lost Lake System. Even though it is not specifically referred to in the decrees or opinions of this Court, it appears from the evidence that it was constructed and operated as a part of the system of the Water Supply & Storage Company.

The position of Colorado is that she feels that in the years when the appropriations of the Laramie-Poudre Tunnel, the Skyline Ditch and the Meadows do not exceed the amount found to be available to Colorado, to-wit, 37,750 acre feet, that in such years, she should be permitted to make use of the available works to bring up her quota to the allotted amount, if the water is available and can be diverted through such works.

IX.

The Wilson Supply Ditch.

At pages 36 to 41 of the brief of complainant, there is set forth so much of the modified decree of October 9, 1922, as pertains to said ditch, and they say that its rights hinge upon whether there was an existing appropriation of water of Deadman Creek prior to 1902, and if so, what amount? They next attack the appropriation both under the modified decree of this Court, and under the laws of Colorado, and contend that said ditch has no appropriation, and has no right to take or divert any water in any date or amount. In view of these contentions we will discuss the same under several heads.

(1) HISTORY OF THE WILSON SUPPLY DITCH SYSTEM, AND ITS APPROPRIATIONS OF WATER.

The title to this system of ditches, also known as the Sand Creek Ditch System, has passed through several ownerships, and interests therein, until it was finally merged in the present owner, The Divide Canal and Reservoir Company, after the same was completed and been in use for several years, where it has since remained. A brief statement of the history from the filing of the first maps and ditch statements claiming appropriations therefor, and descriptions of the respective ownerships are as follows:

Under date of July 21, 1897, Phillip Wilson, and his engineer, Rollin Q. Tenney, filed a statement of claim with map attached, pursuant to the statutes of the State of Colorado, for the Wilson Supply Ditch, particularly describing the same, and stating therein that its carrying capacity from Deadman Creek, to the point of diversion from Sand Creek in Colorado, a distance of 13,145 feet, and that the capacity thereof was 117.5 second feet. That from Sand Creek to Sheep Creek, a distance of a mile

and a half over the Divide to Sheep Creek, its capacity was 288 second feet. Said statement also gave the dimensions and grade of said ditch. This map and statement was introduced in evidence by complainant, marked Exhibit 5 (R. 983-985).

On December 15, 1898, said Rollin Q. Tenney filed an additional map and statement for an extension of said Wilson Supply Ditch south or above Deadman Creek, through Sections 22 and 23, to a point near the south line of Section 26, Township 10 north, Range 75 west. This ditch was 4 feet wide on the bottom and 7 feet wide at high water line, depth of water 2 feet, capacity 35 second feet, date of commencement of work, September 17, 1898. In this filing said Extension Ditch was called The Columbine Extension Ditch (R. 1508).

This ditch so surveyed and appropriation claimed thereby, is the same ditch described in the complaint herein (R. 14), and therein called "The Deadman Extension Ditch," a name never theretofore given to it, but it is the same ditch, and it is a part of The Wilson Supply Ditch, as originally constructed, as testified to by Bruce G. Eaton, who constructed it (R. 658, 661, 662).

After these filings were made by Wilson and Tenney, they proceeded to do work in clearing the timber along the line of said ditches, and they entered into negotiations with Governor Benjamin H. Eaton, who for years had been extensively engaged in the construction of irrigation ditches and reservoirs, to acquire an interest therein, and construct this ditch system. Pursuant to said negotiations, on September 5, 1898, they entered into an agreement whereby Philip Wilson sold his two-thirds interest therein to Governor Eaton, which agreement is Exhibit N-1 (R. 1509).

In order to properly handle the several interests in this project, Benjamin H. Eaton, Bruce G. Eaton, and

Rollin Q. Tenney, incorporated The Divide Ditch Company, Exhibit O (R. 1442-1444). On November 30, 1901, Phillip Wilson, pursuant to his agreement, to sell his interests in said ditch, as above stated, conveyed the same to The Divide Ditch Company, Exhibit P-1 (R. 1511). On December 2, 1901, said Rollin Q. Tenney conveyed to said company his interest in said ditch system, Exhibit Q-1 (R. 1513). On May 1, 1902, Rollin Q. Tenney conveyed his interest in said Columbine Extension Ditch to Benjamin H. Eaton by Exhibit R-1 (R. 1515). And by deed of May 1, 1902, said Benjamin H. Eaton conveyed his interest in said ditches to said company, defendant's Exhibit S-1 (R. 1517).

By the foregoing filings and conveyances the title to The Wilson Supply Ditch and The Columbine Extension Ditch, the same being an extension of The Wilson Supply Ditch, were all merged in The Divide Ditch Company. In the meantime said parties had made filing with the government to procure rights of way over the public domain, Exhibit O-1 (R. 1510-A), which map was filed on November 6, 1899.

Pursuant to said filing of maps and statements for claims of water, and said deeds and conveyances above stated, a large amount of work had been done in clearing the right of way through a heavy timbered country, preparatory to the excavation work of constructing said ditch system. Said work of clearing the timber was a very substantial part of the work of constructing a ditch through a mountainous timbered country. Bruce G. Eaton stated that it was about half of the total work of constructing the ditch, and his testimony shows that the timber had been cleared along that part of the ditch from Sheep Creek to Sand Creek, and from Sand Creek to Deadman Creek, and for a distance of about two miles above Dead-

man Creek, which would be to about the center of Section 26, T. 10 N., R. 75 (R. 649).

It appears from the testimony of Bruce G. Eaton, who was then President of The Divide Ditch Company, and was also the Superintendent of the company, that in April, 1901, after the right of way had been cleared of timber, they moved their ditch outfit, consisting of horses, plows, scrapers, and other tools and utensils from Eaton, Colorad to the north end of said ditch system, and established a camp on the Divide, between Sand Creek and Sheep Creek, and constructed that portion of the ditch, sometimes called the Divide Ditch, of the dimensions and capacities stated in the original filing. It was an open winter in 1901-1902, and they were able to continue their work, particularly the rock work in the tunnel and other portions of the ditch, and they completed that section of the ditch, and thereby diverted water from Sand Creek to Sheep Creek, on May 9, 1902; that his foreman, William Pixler, now dead, was in charge of the work, but he, himself, was frequently present while the work was in progress.

That they then moved the outfit up to Deadman Camp near the Deadman Ditch and constructed that ditch from the upper reaches of Sand Creek, of the size, dimensions and capacity mentioned in the statements of claim and that summer, were enabled to collect and divert water from Deadman Creek for their ditch system. He also stated that they constructed a portion of the ditch above Deadman Creek, of the size and dimensions stated in the statement of claim of the Columbine Extension Ditch, the same being a part of the Wilson Supply Ditch, and worked until driven out by the fall snows. They returned in the Spring of 1903, and completed said ditch to a point where it crossed two unnamed creeks, tributaries to Deadman Creek, and through and across Sections 22 and 23, T. 10 N., R. 75 (R. 635-665).

Said witness, Bruce G. Eaton, testified that, after the timber had been removed, all of said line of ditch as now existing was constructed, as one continuous line of ditch, and without cessation of labor, except during the winter when work could not be done; and that said ditch was constructed at an elevation of 10,500 feet; and that the total cost thereof, not including the use of their equipment, was $150,000.00 (R. 649).

It further appears from the evidence of Bruce G. Eaton that prior to 1904, himself and his father had constructed three reservoirs, filled through the Poudre Valley Ditch, in Water District No. 3, known as Reservoir No. 8, its annex, and Elder Reservoir, with a capacity of about 700,000,000 cubic feet, and had acquired appropriations of water therefor, from the Cache la Poudre River. That they also intended to use part of the capacity of said reservoirs, when available, for the storage of water from the Wilson Supply Ditch, or the Sand Creek Ditch System, by diverting the water into the Cache la Poudre River, and re-diverting it to fill said reservoirs. That they desired to operate said reservoir in conjunction with said Wilson Supply Ditch, and to that end they incorporated, the Divide Canal and Reservoir Company, and conveyed all of said property to said company.

The articles of incorporation stated that it was the intent and purpose of said new company to acquire all of said reservoir and ditch system and to operate the same which purpose is particularly described in said articles, Exhibit P (R. 1446-1454). The deed from the Divide Ditch Company, dated February 15, 1924, conveyed all its interest in said mountain system of ditches to the Divide Canal and Reservoir Company, and ever since has been the owner thereof (Exhibit U-1, R. 1521-1523). Said deed describes the entire line of the Wilson Supply ditch, from section 26, T. 10, N. R. 75, to its point of discharge in Sheep Creek.

After the present company had acquired the property of the Divide Ditch Company in 1904, it employed C. R. Hedke, an engineer, to make a survey of the entire Wilson Supply ditch, and its various portions, from its initial point in section 26, T. 10, N. R. 75, to its point of discharge into Sheep Creek. This he did, and made a map thereof, for its entire length. Said map shows the courses and distances of the entire ditch, including the portion of Sand Creek used as a ditch for the carriage of the water discharged therein. The defendant offered this map in evidence, and the witness carefully examined the same, and stated that it correctly shows the ditch as originally constructed, and since maintained and operated. This map was marked Exhibit J-1 and is shown in R. 1496-B.

The first witness who testified on behalf of complainant was Burton P. Fleming. He testified that he spent the entire year of 1902 and part of 1903 as an engineer employed by the government, to make a careful investigation of Sand Creek and vicinity, under the direction of the Wyoming experiment station, and that on the conclusion of his labors, he made a written report, with a map attached, which was published in Bulletin No. 132 of the experiment station, and that the matters therein stated were correct. Complainant offered in evidence, as its Exhibit No. 1, pages 101 to 123, inclusive, including a map attached at page 101, of said Bulletin of 1903, published by the United States Department of Agriculture, and Fleming testified that he wrote said report, prepared said map, and that the same accurately stated his observations and measurements in 1902 and 1903 (R. 87-89). Said map is also shown as a part of said Exhibit (R. 957). An inspection of this map shows the entire line of this ditch, including the portion thereof in sections 22 and 23, T. 10, N. R. 75. This part of the ditch bears the legend "The Columbine Ditch," but is the same ditch hereinbefore described as "Columbine Extension Ditch," as he found the same in 1902 and 1903.

Witness for defendant, Bruce G. Eaton, while testifying, examined complainant's Exhibit No. 1, and particularly the map shown at page 101, and stated that said Exhibit shows the line of ditch filed on as "Columbine Extension Ditch" connected with the "Deadman Ditch" which was originally built as a part of their Sand Creek system of ditches, theretofore testified to by him (R. 647), and as shown on Exhibit J-1 (R. 957). From these maps it appears that the portion of the Wilson Supply ditch, above or south of Deadman Creek, was an existing ditch in 1902 and 1903 and was so observed by the witness Fleming, and the witness Eaton stated that it was all built as one continuous line of ditch, and as a part of the Wilson Supply ditch and is not a recent structure, as alleged in the bill of complaint herein.

(2) THE ADJUDICATION OF APPROPRIATION OF THE WILSON SUPPLY DITCH, ALSO KNOWN AS THE SAND CREEK DITCH SYSTEM.

On February 3, 1906, a petition was filed in the district court in Larimer County for the purpose of adjudicating and determining the rights to the use of water in Water District No. 48 in the State of Colorado. The Divide Canal and Reservoir Company, then owner of the Wilson Supply Ditch and its various sections, also known as the Sand Creek Ditch System, appeared therein, and filed its statement of claim, of appropriation of water from Deadman Creek and its tributaries, and also from Sand Creek, which statement of claim is defendant's Exhibit K-1 (R. 1497), and it also filed an amended statement showing the line of Sand Creek, to be used as a conduit for the carriage of water, defendant's Exhibit L-1 (R. 502-508). The map, Exhibit J-1, was also made a part of the statement of claim, and the original head of the Deadman Ditch is therein described as being located at a point north 22 degrees, 10 minutes west 950 feet from the south quarter corner of section 26, T. 10, N. R. 75, and states

that the combined ditch runs on the original line of the Deadman Ditch and describes the whole course as one line of ditch to the junction with Sand Creek. It also particularly describes the dimensions and carrying capacity of each portion of the entire ditch system, and showed the same capacities, and claimed the same volume and date of appropriation, as finally determined by the Court, in its findings and decree. The owner of the ditch also submitted evidence in support of its claim of appropriation from the several streams, and on October 11, 1906, the Court made and entered its findings and decrees relative to the various claimants, and their appropriation of water, all in accordance with the statutes of the State of Colorado, relative to the adjudication of water rights in said state.

Compiled Laws Colorado 1921, Secs. 1752-1755 and 1760-1789.

This adjudication decree was marked Exhibit G, and is found in the printed record, pages 1275 to 1296. On page 1278 the Sand Creek System Ditch, being the same as the Wilson Supply Ditch, was given number 36, with date of appropriation of June 15, 1899, and priority number in said Water District No. 38. On page 1278 the decree expressly states that said appropriations of water therein contained

> "shall be taken, deemed and held as intended to determine and establish the several priorities of right by appropriation of water from the streams of said Water District No. 48, for irrigation, of the several ditches and canals * * * each according to the construction, enlargement or extension thereof, with the amount of water held to have been appropriated thereby * * * and the several appropriations of water by means of them respectively claimed in this matter, ordered, adjudged and decreed, as in and by the findings of the

referee as follows:" [naming and describing each ditch in order of its priority and appropriation].

The findings concerning Ditch No. 36, Sand Creek Ditch System, are set forth on pages 1266 and 1267, and show that the capacity of the Columbine Ditch is 40 cubic feet per second of time, and the Deadman Ditch 117 second feet, and said amounts plus the waters appropriated from Sand Creek aggregate 288 second feet. It also states that the Deadman Ditch cuts the main branch of Deadman Creek and two other branches of said creek. The decretal order concerning said ditch is shown on Record pages 1282 and 1283, and it approves and confirms the findings and appropriations made for said ditch in the total amount of 288 second feet, and concludes, "*the appropriation of which water took effect on, and said priority dates from the 15th day of June, 1899.*" The findings and the decretal order for the Sand Creek Ditch system (Wilson Supply Ditch) were also read into the record from said Exhibit G, as aforesaid, and the same are found at page 663-665 of the oral evidence.

The Colorado Supreme Court has repeatedly held that the adjudication decrees of water rights under the statutes of Colorado, as aforesaid, are a complete and final determination, both of the date or priority of the right, and of the volume or capacity stated in the decree, and that said decrees are an acknowledgment of the right to use of water in said state.

Louden Canal Company v. Handy Ditch Company, 22 Colo. 102, 110-114; 43 Pac. 535.

Arnold v. Roup, 61 Colo. 316, 322-326; 157 Pac. 206.

The right of the Divide Canal and Reservoir Company, present owner of the Wilson Supply Ditch, to take and divert water from Deadman Creek and its tributaries, in the amount of 117 second feet, and from Sand Creek,

in the amount of 131 second feet, and 40 second feet from Columbine Creek, aggregating 288 second feet, was fully determined, both as to priority of time, and volume, in said adjudication proceedings. Said decree is the final determination of said right and constitutes a full recognition of said appropriation, by the State of Colorado both as to the date or priority, and also the capacity of said ditch and the volume of said appropriation, and is the right definitely recognized in the modified decree of this Court, made on October 9, 1922, in the former case, between the State of Colorado and the State of Wyoming, and constitutes the only right mentioned therein.

State of Wyoming v. State of Colorado, 260 U. S. 1-2; 66 Law. Ed. 1026.

(3) THERE HAS BEEN NO ENLARGEMENT OF WILSON SUPPLY DITCH SINCE FIRST CONSTRUCTED.

The bill of complaint charges that the Wilson Supply Ditch was enlarged in 1929 and 1930 (R. 14 and 15). And the answer admits that some work of cleaning and repairing had been done at the point indicated, but denies that said work of cleaning was an enlargement, or that the carrying capacity thereof was increased thereby; and avers that such cleaning and repair is necessary almost yearly on a mountain ditch; that the point indicated was in the central portion of the ditch above Deadman Creek, and that, as so cleaned and repaired, it carried no more water than formerly (R. 17).

In support of complainant's contention of enlargement, it offered in evidence a certified copy of the Wilson Supply Ditch map and statement, filed by Phillip Wilson and his engineer, July 23, 1897 (R. 984-A). This map shows a sharp "V-angle" in the course of the survey of the ditch in SE. SW. of section 15, T. 10, N. R. 75. This sharp angle in the line of the ditch as surveyed was occasioned by reason of a sharp point of land on the upper side there-

of. The angle as shown on the map is about 1,000 feet on each side, as it departed from the straight line of the ditch, and as it returned to said straight line, and the distance through this spur was about 400 feet, so that the cut through the point for such short distance made a much shorter ditch, and a straighter line, and involved much less labor. The evidence shows that the original ditch was cut through the spur, and that no ditch was built around it. From the evidence of Bruce G. Eaton, it appears that he arrived one morning when the ditch was being constructed at that point, and he saw that his foreman, William Pixler, had commenced to plow for the ditch on one side of said triangle, following the original survey, for a short distance; that he stated to Mr. Eaton that it was not the proper way to construct the line of ditch at that point; that it was some 2,000 feet or more to follow the survey around said "V-shaped" angle, as shown on Exhibit No. 5, but that the ditch should be cut through the spur, a distance of 300 or 400 feet, and that it would make a straighter and better ditch. Mr. Eaton told him to cut the ditch through the spur, and not go around the high point of land, and that Pixler did cut through said point of land, and so constructed the ditch when it was originally made, and it has so remained until this day. That the cut at the deepest point was about 15 to 18 feet, and that they covered the ditch in this cut with poles to keep the snow from drifting in the winter and filling the ditch (R. 650, 651).

The attention of said witness was called to the testimony of Mr. Drummond and Henry C. Watson, witnesses for complainant, who testified the ditch had been enlarged at said triangle, since the original construction, at that point, and they submitted a photograph, Exhibit No. 11 (R. 988-A), labelled "old ditch," and contended that there had been an enlargement at that point. They also testified that the "old ditch," so called, was not more than a

tenth of the size of the present ditch (R. 187). After having examined said Exhibit, witness Eaton said that the ditch had never been constructed around said spur nor along the line of said "V-triangle," but was originally constructed as a cut through the base of said triangle, at the time when the ditch was originally made (R. 650-651).

Defendant, in its testimony, offered in evidence Exhibit J-1 (R. 1496-B), as surveyed by C. R. Hedke in 1904 after the ditch was completed and in use. This Exhibit consists of a map of the entire system, and shows that the ditch was constructed through the SE. SW. Section 15, T. 10, N. R. 75, on practically a direct line through said spur of the mountain, and not with a V-shaped angle as shown in the original survey. Furthermore, the statement of claim filed in the adjudication proceedings in the spring of 1906, shows by courses and distances that said ditch was built on a comparatively straight line at said point in Section 15, and not with a V-shaped angle, shown on original survey. Further it appears from the testimony of defendant's witness, L. L. Stimson, that in 1933, after he had read the evidence of the complainant's witnesses, and had examined Exhibit 11, he went over the ground at said point, and had examined the claimed ditch shown by Exhibit 11, and stated that its entire length was about 500 feet, and consisted of one plowing that had been taken out and put on the bank; that the total distance around the point or triangle was about 2,000 feet, and there was no evidence of a ditch for the balance of the distance around the triangle, except clearing of the timber, so it is clear that if complainant's witnesses had examined the entire ground around the triangle, instead of the little point where it left the direct line of the ditch, they would have discovered that no ditch had ever been constructed around the two sides of said triangle. Said witness further stated that cutting the ditch through the spur was proper construction, and that anyone would have

been crazy to build a long ditch around said triangle, when they could cut it through the hill for a distance of 400 feet (R. 795).

On cross-examination said Henry G. Watson, witness for complainant, concerning said alleged "old ditch," admitted that he did not know when the cut was made, but thought it was more than 20 years before; that the change of the line of the ditch from the triangle form to the cut would not affect its capacity, and finally admitted that he did not know that the alleged "old ditch" was actually put into service, or whether they changed their plans while they were constructing it; also that it was customary in the construction of a ditch, to change the line at some points (R. 197). From the foregoing it is manifest that the ditch was originally constructed as it now is through said high point or spur, and that there has been no enlargement thereof at that point.

The other point of claimed enlargement was on that part of the ditch south and above Deadman Creek, in Section 22, where some stakes had been set, which he first observed in 1929 (R. 185). This witness examined complainant's Exhibit No. 1 and map attached (R. 957), and stated that the line of ditch from Section 15 to 26, shown on said map, labelled "Columbine," was the line of ditch he called Deadman Extension, and was an extension of the Wilson Supply Ditch, south of Deadman Creek. That he found a ditch constructed along said line, of the size and dimensions in the original statement of claim, and that it was at a point along this part of the ditch where he found the stakes set, for a proposed enlargement (R. 193-195). Said witness also testified that there was wash from the upper side of the ditch which would cause some sloughing into the ditch at times; that in order to keep the ditch in shape and in alignment, it was ordinary practice to clean it from time to time; that if it was not cleaned for three or four years, any ditch would require a more ex-

tensive and thorough cleaning, and whatever washed into the ditch tended to diminish capacity, and require cleaning and repair; that in making such cleaning of accumulations in the ditch, it is ordinarily put in the lower side. That is the ordinary mode of doing such work (R. 195, 196). Neither the testimony of Mr. Watson nor Mr. Drummond concerning this so-called enlargement shows any specific point of enlargement, or the extent of any claimed enlargement, but rather shows the ordinary cleaning and repair of a ditch, which they admit has to be done frequently.

E. B. House, engineer, witness for defendant, testified that he was the engineer who made survey and set stakes for making repair work on the ditch. He stated that the ditch was four feet wide on the bottom with carrying depth three feet at that point. That by reason of being so narrow and deep, there was considerable trouble with the banks breaking, and the storms would wash material from above into the ditch. That in order to correct conditions at that point, he made the ditch wider on the bottom, but more shallow, and changed the cross-section, for a short distance, from four feet wide and three feet deep to six feet wide and two feet deep, which would give the ditch at that point exactly the same cross-section, and was not an enlargement, but was made for the purpose of widening and strengthening the lower bank (R. 762-763). As this change in cross-section was only for a short distance, and made for the purpose of strengthening the banks, it did not change the capacity at this point, from that above or below, and would not constitute an enlargement of the ditch, but only a proper and necessary repair to protect the bank at said point.

Defendant's witness, Bruce G. Eaton, testified that there had been no enlargement of the Deadman Ditch since it was originally constructed, nor of the Deadman Feeder Ditch (R. 660 and 674). And his son, Rex C. Eaton, who

has been superintendent of the ditch for the past 12 years, stated that there had been no enlargement of the Deadman Ditch, nor of the Extension Ditch, since he had been manager thereof, nor since he first worked on the ditch in the summer of 1911. That all the work done thereon at any time was the work of cleaning, incident to the operation of any ditch (R. 667 and 674).

Taking into consideration all of the evidence, it is clear that there has been no enlargement of any portion of said ditch since the time of its construction. That the only work done thereon, was the ordinary cleaning which all the engineers, witnesses for complainant and defendant, said was necessary and proper to be done on any ditch, and especially upon a mountain ditch, which is more difficult to keep clean and in proper repair, than a ditch on the plains. We submit that the complainant failed to establish its contention that this ditch had been enlarged, or its capacity increased, since its original construction.

(4) THE RIGHTS AND APPROPRIATIONS OF THE WILSON SUPPLY DITCH WERE DETERMINED BY THIS COURT IN THE MODIFIED DECREE OF OCTOBER 9, 1922, IN THE FORMER SUIT.

Complainant in its bill of complaint set forth the provisions of the modified decree of this Court, made and entered October 9, 1922 (Wyoming v. Colorado, 260 U. S. 1; 66 Law. Ed. 1026), as a basis of its action in the present case (R. 4, 5), in which the Wilson Supply Ditch was awarded an appropriation of water from Deadman Creek as in said decree stated. After having so pleaded its rights established by said decree, said bill of complaint, par. 14, pp. 15, 16, charges, that nevertheless no appropriation of water whatsoever was so awarded; that there was no appropriation for said ditch prior to 1902, and that there is not now any lawful appropriation of water from said Deadman Creek by or through the Wilson Supply Ditch. In this proceeding complainant contests the rights

awarded said ditch under said modified decree, although they are stated in said decree.

In his brief filed herein, counsel for complainant cites and relies on a portion of the opinion of this Court on motion to dismiss (286 U. S. 494, 496, 497; 76 Law. Ed. 1245, 1251):

> "We are of the opinion that the record, opinion and decree in the former suit, herein reviewed at length, shows very plainly that the decree must be taken as determining the relative rights of the two states, including their respective citizens, to divert and use the waters of the Laramie and its tributaries. These rights were put in issue by the pleadings, displayed in the evidence, and considered and resolved in the opinion. Not only so, but the question of priority in time and right as between the appropriators in Colorado and those in Wyoming were directly presented by the pleadings and evidence and distinctly dealt with and resolved in the opinion."

Concerning which statement counsel says: "thereby settling the question of the construction of the decree in the former case, leaving for determination the question, 'Has the State of Colorado violated the decree?' "

Following this statement of the Court as to what was found and determined in said modified decree of October 9, 1922, counsel for complainant refers to page 35 of the Record, where they have set forth in full said decree showing *inter alia* that the Wilson Supply Ditch was one of the ditches awarded an appropriation by said decree; but this is followed by a statement on page 4 of their brief, and particularly in sub-paragraph (4) thereof, by a statement "that prior to 1902, no water had been appropriated from the headwaters of Deadman Creek through the Wilson Supply Ditch," and other allegations, that the Wilson

Supply Ditch never had an appropriation from Deadman Creek or its tributaries. Again, at page 9 of their brief, they state that one of the issues of fact is whether the State of Colorado is entitled to appropriate any water from the headwaters of the Deadman Creek. Again, on page 10 of their brief, it charges that the facts as established show that the Deadman diversion is illegal; that no water had been appropriated prior to 1902, and none can be lawfully diverted subsequently under the terms of the modified decree. Again, on page 36, in paragraph VI of their brief, they quote that portion of the modified decree pertaining to the Wilson Supply Ditch, and state that the right of Colorado to divert water from Deadman Creek, as provided in said decree, hinges upon whether there was an existing appropriation of water from the headwaters of Deadman Creek, prior to 1902, and in the succeeding pages of their brief, 37-41, they contend that the Wilson Supply Ditch, acquired no decreed right under said modified decree of this Court; and never acquired any valid appropriation under the laws of Colorado.

From the foregoing it is apparent that complainant now contends that this Court erred in granting any existing appropriation to the Wilson Supply Ditch, in said modified decree; that said ditch never made nor perfected an appropriation as therein stated, and no water was awarded thereby, and that all diversions of water from Deadman Creek made by said Wilson Supply Ditch have been unlawful, and to the detriment of the water users of Wyoming, and that said ditch should be now denied the right to divert any water from Deadman Creek. The contentions so made are a direct attack upon said modified decree, and cannot properly be considered in this bill, to enforce the provisions of said decree concerning said ditch.

In the modified decree entered October 9, 1922, in the former suit between Wyoming and Colorado, the right of

the Wilson Supply Ditch to take water from the Deadman Creek, was determined as follows:

> "nor prejudice the right of the State of Colorado, or of anyone recognized by her as duly entitled thereto, to continue to exercise the right now existing and hereby recognized to divert and take from the headwaters of Deadman Creek, a Colorado tributary of the Laramie River, the relatively small amount of water appropriated therefrom prior to the year 1902 by and through what is designated in the evidence as the Wilson Supply Ditch."
>
> Wyoming v. Colorado, 260 U. S. 1 and 2; 66 Law. Ed. 1026.

By the foregoing decretal order this Court clearly determined that the Wilson Supply Ditch then had an existing right and priority to take and divert water from the headwaters of Deadman Creek; that it was an existing right; and was a right recognized by this Court; and that it was an existing appropriation recognized by Colorado; and vested prior to the year 1902. The only undetermined matter was "the relatively small amount of water appropriated prior to 1902." The Court did not undertake to determine the amount, but by referring to the preceding language of the order, it clearly refers to the appropriation in time or amount theretofore recognized by the State of Colorado, as that would be the only way to determine the amount of the water appropriated by said ditch.

As we have before shown, the State of Colorado by its laws and said adjudication proceedings established the amount of the appropriation as 117 second feet from Deadman Creek as of date July 15, 1899, and for more than 20 years prior to entry of said modified decree, it had diverted and taken and beneficially used the amount of said appropriation up to the available water supply therefor,

and so continued to divert and use said water, until this Court more particularly defined the volume of said water, in the former hearing of this cause. (286 U. S. 491, 506; 76 Law. Ed. 1245, 1251.)

If there was any uncertainty concerning the appropriation of the Wilson Supply Ditch, or its right to appropriate water from Deadman Creek, or the amount thereof, the same was settled by the opinion of this Court rendered upon the motion to dismiss (286 U. S. 494-510; 76 Law. Ed. 245-253). In that opinion the Court reviews the former case, and the decree entered therein, and particularly refers to and considers the appropriation of the Wilson Supply Ditch, and specifically stated that it was excepted from the quantity of water allotted to Wyoming, the same as the Skyline Ditch, and in regard to the quantity of water appropriated from Deadman Creek, the Court said:

> "Colorado's state engineer gave 4,250 acre feet per annum as the measure of the meadow land appropriation, 18,000 acre feet per annum as the measure of the Skyline appropriation, and 2,000 acre feet per annum as the measure of the Wilson Supply Ditch appropriation. Some of her witnesses gave different measures. All who spoke of the Wilson Supply Ditch agreed that it was used to divert water from the headwaters of Deadman Creek, a Colorado tributary of the Laramie, into Sand Creek, from which that water, or its equivalent was rediverted at a lower point, along with other waters from Sand Creek, through the Divide Ditch and ultimately carried into the Cache la Poudre Valley. Colorado's evidence indicated that the meadow land, Skyline and Wilson Supply appropriations were earlier than the Laramie-Poudre tunnel appropriation and many of the Wyoming appropriations; and Wyoming recognized this dif-

ference on dates of appropriation, although raising some question as to the quantity of water in the earlier appropriations so recognized." (286 U. S. at p. 501; 76 Law. Ed. 1248.)

It thus appears that the amount of the appropriation of the Wilson Supply Ditch from Deadman Creek was for the first time considered in said opinion, and the amount thereof determined, and it was classed, with the Skyline appropriation, as being prior to appropriations in Wyoming. In referring to the allotment of the water between appropriators in Colorado and Wyoming, and the determination of the amount thereof, the Court said:

> "There are some existing Colorado appropriations having priorities entitling them to precedence over the Wyoming appropriations. These recognized appropriations are, 18,000 acre feet for what is known as the Skyline Ditch and 4,250 acre feet for the irrigation of that number of acres of native hay meadows in the Laramie Valley in Colorado. These recognized Colorado appropriations aggregating 22,250 acre feet are not to be deducted from the 288,000 acre feet, that being the available supply after they are satisfied. Nor is Colorado's appropriation from Sand Creek to be deducted, that creek, as we have shown, not being a tributary of the Laramie." (286 U. S. at 504; 76 Law. Ed. at 1250.)

After so stating the Court then resumes its decision concerning the tunnel appropriation, the Skyline appropriation, and the meadow appropriation, and the Wilson Supply appropriation, mentioned in the modified decree, and said:

> "Colorado and her co-defendants presented a petition for rehearing on stated grounds, one of which was that the Wilson Supply Ditch appropriation was

inadvertently omitted, in both opinion and decree, from the recognized early appropriations. As the omission was in fact inadvertent, the decree was then so modified as to include that appropriation among the others, which Colorado was recognized as having a right to continue." (286 U. S. at 506; 76 Law. Ed. at 1251.)

By this construction of the modified decree of October 9, 1922, two points were clearly settled: one, that the Wilson Supply Ditch appropriation was classed with the Skyline Ditch appropriation, and the meadow appropriation, as existing appropriations not to be deducted from the amount of water to which Colorado was entitled; and two, that the amount of the appropriation of the Wilson Supply Ditch, from Deadman Creek and its tributaries, was 2,000 acre feet per annum.

In view of these determinations it does not lie in the mouth of the complainant now to claim that under the modified decree as amplified by the decision of this Court, said ditch did not have an appropriation from Deadman Creek of 2,000 acre feet, prior to 1902; or to say that the amount of said appropriation was not adjudged to be superior to Wyoming appropriations; or charge that the diversions of water from Deadman Creek by the Wilson Supply Ditch since the rendition of said decree, have been unlawful and should now be abated, as not permitted by said decree. We contend that under said modified decree, and under the opinion and decision of this Court in the former hearing amplifying the same, as aforesaid, that the appropriation from Deadman Creek, by the Wilson Supply Ditch, both in time, amount and priority, has been definitely settled in its favor, and complainant may not now attack the same by attempting to prove otherwise. Furthermore, we contend that the evidence in this cause clearly establishes such appropriation, prior to 1902, and that said appropriation was long recognized and de-

termined by Colorado courts, by the decree entered in Colorado, on October 11, 1906 (Ex. G, R. 1275 to 1296).

Under the heading of "HISTORY OF THE WILSON SUPPLY DITCH SYSTEM, AND ITS APPROPRIATIONS OF WATER," we have given a full and complete statement of what had been done to perfect an appropriation of water for the Wilson Supply Ditch, beginning with the original filing made by Phillip Wilson, for the Wilson Supply Ditch, and of the Columbine Extension Ditch, made by Rollin Q. Tenney (in the bill of complaint herein, called the Deadman Extension Ditch), both of which were constructed as one ditch, and have always been so used. This history shows that the original owners proceeded at once to clear right of way of timber; that B. H. Eaton in 1898 entered into an agreement to purchase the two-thirds interest of Phillip Wilson, and construct the ditch; that pursuant to said purpose, B. H. Eaton, Bruce G. Eaton and R. Q. Tenney incorporated the Divide Ditch Company, to which all the parties conveyed their respective interests in said ditches; that after the right of way had been cleared of timber, by said former owners, which the testimony shows was one-half of the necessary work of construction, in April, 1901, they moved a ditch outfit onto the line of ditch, and continued the work of construction, all that year, doing rock and tunnel work, in the winter, and completed said portion of ditch, and turned the water therein, on May 9, 1902; that they immediately moved their camp to Deadman Ditch, and constructed all of Deadman Ditch, and diverted water therefrom that summer, and continued their work of construction, and built the ditch to the first small creek beyond Deadman, where they were stopped by the fall snows; that they returned in the spring of 1903, and completed said extenson ditch, beyond the second creek, in Section 23, T. 10, N. R. 75. That ever since, it has diverted water from Deadman Creek and its

tributaries and applied the same to beneficial purposes, whereby an appropriation of water therefrom was perfected, a decree confirming the same was duly made and entered, whereby Colorado recognized an appropriation therefor in the amount of 117 second feet, as of date of July 15, 1899. Said decree also awarded an appropriation of 40 second feet for Columbine Ditch, and 131 second feet from Sand Creek, or a total of 288 second feet.

(5) THE DOCTRINE OF RELATION.

Complainant in its brief contends that the Wilson Supply Ditch has no appropriation of water from Deadman Creek nor Sand Creek prior to 1902, because, as it says, no water was *diverted* prior to May 9, 1902. In so contending, counsel for complainant ignores the well established rule in all of the arid states, that the date of the appropriation relates to the date of survey of the ditch, or other acts showing intention to construct a ditch, provided the work is prosecuted with reasonable diligence to completion, and the water diverted and applied to a beneficial use. This rule is well stated in a Colorado case, as follows:

> "Although the appropriation is not deemed complete until the actual diversion or use of the water, still if such work be prosecuted with reasonable diligence, the right relates to the time when the first step was taken to secure it."
>
> Sieber v. Frink, 7 Colo. 148, at 153; 2 Pac. 901, 903.

Kinney on Irrigation and Water Rights, second edition, Section 745, adopts said rule *verbatim* and states, "We adopt this statement of the rule as the present law on the subject in all jurisdictions." Further citation of authority is unnecessary because this Court in the former case (Wyoming v. Colorado, 259 U. S. 419; 66 Law. Ed. 999) adopted this same rule, and applied the same in de-

termining what date of appropriation should be fixed for the tunnel project. In that case the owners of the tunnel and ditches connected therewith, contended that the date of appropriation should date from the year 1902, by reason of several filings made, made at that date, of an intention to make a trans-mountain diversion, not through the tunnel but by means of other ditches, and the Court held that there was no definite or certain plan of diverting the water by means of the tunnel, until October, 1909. One of the main contentions in that case was as to what date should be given under the doctrine of relation, the work not having been completed when the suit was filed, nor entirely completed when the evidence was taken; nevertheless this Court held that under the doctrine of relation the appropriation should be accorded a priority of October, 1909, and its conclusion is as follows:

> "We conclude that the appropriation should be accorded a priority by relation as of the latter part of October, 1909, when work was begun."
>
> Wyoming v. Colorado, 259 U. S. 419, at 495; 66 Law. Ed. 999, at 1025.

In this case the original filings of statements of claim by Phillip Wilson and R. Q. Tenney show a definite plan, to construct this ditch, substantially along the line upon which the filings were made, and on September 5, 1898, B. H. Eaton agreed to buy the two-thirds interest of Phillip Wilson, and build the ditch, and Rollin Q. Tenney also conveyed his interest in the extension ditch, and he and the Eatons organized the Divide Ditch Company to complete the ditch. In the meantime a large amount of work had been done in procuring right of way over government land, and clearing the right of way of timber, which the evidence shows was about half of the work of constructing the ditch. After that had been done, the Eatons moved their ditch outfit to that portion of the ditch called the Divide Ditch, in April, 1901, and began the excavation

work, and continued said work throughout that year, and in the winter of 1901-1902, they continued construction work on the tunnel, and other rock work, and completed that portion of the ditch, and turned water therein, on May 9, 1902. Immediately they moved their ditch outfit to that part of the ditch, sometimes called Deadman Ditch, being a part of the Wilson Supply Ditch, and completed it, that summer, to Deadman Creek, and diverted water from said creek. Construction work then continued to the first creek above Deadman Creek before they were driven out by the snows. They returned in the spring and completed the ditch beyond the second little creek, and as far south as the south line of Section 23, T. 10, N. R. 75; all of which appears under the head of the History of the Wilson Supply Ditch, reference to which is hereby made.

It appears from the evidence herein that the work was prosecuted under a general plan, and was completed with diligence according to said plan. That the ditch was difficult of construction, considerable portions thereof being rock work. It does appear that the date of appropriation should relate to the date of surveys and filing, or the date of the agreement in 1898 when Mr. Eaton bought the interest of Phillip Wilson and agreed to and did construct the ditch. After the right of way had been cleared excavation work was commenced in April, 1901, and thereafter was prosecuted continuously and with great diligence until completion, and water was diverted and used. The Court in Colorado fixed the date of appropriation by relation as July 15, 1899, and this Court, both in the original case and in the prior decision in this case, recognized said appropriation as earlier than 1902. Nevertheless counsel for complainant in their brief contend that the Wilson Supply Ditch never had an appropriation of any date or amount, and now has no appropriation, and that the waters diverted by said ditch from the headwaters of Deadman since 1922, have been unlawful and in diminution of the rights of the complainant, all of which

is contrary to the decisions of this Court in relation thereto, and contrary to the modified decree entered October 9, 1922, which awarded said ditch the right by reason of the then existing recognized appropriation, which rights were again confirmed in the former hearing in this cause on motion to dismiss.

X.

The Wilson Supply Ditch has Not Deprived Meadow Ditches on Sand Creek in Wyoming of Water to which They were Entitled.

As we have before shown, the Wilson Supply Ditch, or Sand Creek System of Ditches, also has an appropriation of water from Sand Creek in Colorado, as of the date of July 15, 1899. We now make reply to the contentions urged by complainant under Point VIII of its brief with respect to the rights of Colorado appropriators on Sand Creek. This Court has held in all the former hearings that Sand Creek is not a tributary of the Laramie River, but a separate stream. Counsel for complainant, in their motion to dismiss, contended that this case is a bill to enforce the modified decree of October 9, 1922, so far as it pertains to the Laramie River; and this Court in its opinion on said motion stated that this is an original suit "to enforce a decree of the Supreme Court of the United States in an earlier suit between the same States respecting their relative rights to divert and use for irrigation the waters of the Laramie River." (286 U. S. 494-5; 76 Law. Ed. 1245.)

It thus appears that the amended complaint was directed only to alleged violations of the former decree in regard to the Laramie River, and does not include Sand Creek, which this Court held in both cases, "not to be a tributary of the Laramie River." Nevertheless, without pleading the right of any appropriator from Sand Creek,

and said right, if any, not having been made an issue in this case, complainant improperly offered evidence of a general nature to show that the diversion of water from Sand Creek, in Colorado, by the Wilson Supply Ditch, had diminished the supply of certain small meadow ditches from Sand Creek in Wyoming. Such contention is advanced by the complainant in its brief, and we maintain that the evidence herein does not sustain such contention.

This question arose at the beginning of the taking of evidence, and two or three of the farmer witnesses of complainant stated generally that they were always short of water since the Wilson Supply Ditch commenced its diversion, but on cross-examination were not able to state any particular time when such shortage occurred or the amount thereof. Such general statements are of little weight in a case of this character, when specific times and amounts must be shown to sustain such contention.

It appears from defendant's Exhibit O-3 (R. 1621-2), that during the past 30 years there have been six years in which no water was diverted from Sand Creek by the Wilson Supply Ditch. If there was a shortage then, it did not occur by reason of any act of said ditch; further, there were years when the company built a channel reservoir in Sheep Creek and could not divert water because it would interfere with the work. On two other years they found it necessary to construct a cement wall to bedrock behind the earth dam, to stop leakage from the reservoir, and also to cement the face of the reservoir in connection with said cement wall, at which times no water was diverted. This accounted for failure to divert in those years. There were two years in which the Divide Ditch broke, and washed away the lower bank and bottom of the ditch, on the mountain side, so the ditch could not be used for several weeks, while being repaired. There were occasions in some years, when the Cache la Poudre River was so high, that the water commissioner would not permit diversions by this ditch, or

any of the trans-mountain ditches. During all of these times the meadow ditches in Wyoming had all the water, and if they were short, it was not by reason of the diversion of the Wilson Supply Ditch. Testimony of Bruce G. Eaton (R. 653-655). Testimony of Rex C. Eaton (R. 676-677) and Testimony of W. J. McAnelly, water commissioner in Water District No. 3 (R. 692).

Complainant's witness George Widman testified, that he was the water commissioner in charge of Sand Creek in Wyoming, from 1922 until 1930, and was deputy water commissioner in 1931. He stated that his first visit to the Eaton Ditch and to see Mr. Eaton in regard to turning down water, was on June 13, 1927, five years after he became water commissioner, which indicates there was no call to turn down water during those years. His next visit was June 2, 1928, and he called up Mr. Eaton at Greeley, and asked him if he would turn down some water for the users in Wyoming and he said he would. I did not go back there again that summer. My next visit was on June 24, 1929. On that occasion I tried to see if Mr. Eaton would turn down some water. I do not know whether he did or not, as I did not go up there again that summer. My next occasion to go up there was on June 12, 1930. The witness evidently did nothing on this occasion. His next trip was on June 23, 1930. At that time we estimated 10 sec. ft. of water in the Eaton Ditch, and they were letting 10 sec. ft. go down the creek. When I spoke to Mr. Eaton, he said he would turn down a certain amount of water to the Wyoming appropriators. I suppose he did; he never refused; he just said he would turn some water down (R. 141-144). Again he testified, in substance:

I made a request of Mr. Eaton to release water down Sand Creek, because the water rights in Wyoming were not getting their appropriations. I made such request on June 13, 1927, and again on June 2, 1928. They said they would let water down. I never went back to check up and

see whether they let it down. On other occasions they agreed to turn water down and I suppose they did. I never had any complaint. I never went back to find out (R. 884, 885).

Rex C. Eaton, manager of the Wilson Supply Ditch, since 1918, testified: He stated that on three or four occasions, the water commissioner in Wyoming had some complaint and had taken up the matter with him about turning down some water. As I remember it was once in 1928, twice in 1929, and once in 1930. I turned down water to them on those occasions. I always turned down water when requested. He also testified that Mr. Whiting, the State Engineer of Wyoming, had said to him, that we co-operated with him to a great extent in that matter. I think we got along a lot easier than we do between various claimants on the Poudre River. They have no measuring devices or headgates. They just take all the water available at their particular headgate, and that fellow floods his meadow as much as he can, and lets it run back into the creek, and the next fellow will do the same. In that way the same water is used over and over a number of times. The attention of the witness was called to complainant's Exhibit No. 1, and page 131 (R. 964) of the book where complainant's witness Burton P. Fleming stated that after the meadows were once irrigated, the return to the stream was about 95%, and witness stated that was about his estimate. I have been up and down the creek and have not seen but one headgate on these ditches, and I would not call that device much of a headgate. I have heard that there was another one but have not seen it (R. 678).

From the foregoing evidence it appears that there were only four times since 1922, when the Court entered the modified decree, and when George Widman became water commissioner, on Sand Creek, in Wyoming, that any request or demand was made for the Wilson Supply Ditch to turn down water for said meadow ditches; that in each

instance, Mr. Eaton, superintendent of the ditch, readily agreed to turn down water and said that he did turn it down; that the water commissioner said he supposed he did, and that he had no further complaint. This evidence shows that there were very few complaints by said ditches made through their water commissioner, and they made none themselves. Such complaints occur on all ditches and as the junior appropriator is entitled to the water until the senior needs it, the junior awaits the call of the senior, and then releases water, as in this case. Such procedure shows no intention of the junior to deprive the senior of his water and is the ordinary way in which such matters are handled.

L. L. Stimson, a qualified engineer, witness for defendant, testified that in May, 1933, he was employed by The Divide Canal and Reservoir Company, to investigate their ditch system in Colorado, also the various ditches taking water from Sand Creek in Wyoming. That in making said investigation he took with him two assistants, T. B. Moody, his partner, a qualified irrigation engineer, with 25 years' experience, and very expert in water matters. Also his son, a graduate in engineering of the Agricultural College of Ft. Collins, Colo., who had been his assistant since 1925, and was a proficient and experienced engineer (R. 775). He testified that he first went to the camp at Wooster Reservoir, by way of Tie Siding, and found that there was so much water along Sand Creek that it was impossible to measure the small ditches. That he found 232 sec. ft. of water at Running Water Ranch. That it was then impossible to get to the head of the Divide Ditch on account of so much snow. That men were trying to open the Divide Ditch from Sand Creek to Sheep Creek by digging a trench in the snow in the ditch. There was no water either in the ditch or Sand Creek, because it was frozen. That the elevation at that point was 9,000 feet and there was no water running at that elevation anywhere (R. 776).

That he went up with his assistants on May 20, 1933. By that time the amount of water in Sand Creek at the Colorado-Wyoming line had fallen to 70 sec. ft. That he tried to get to the Divide weir, but had to walk 4 or 5 miles and then found no water running because it was still frozen at the head. By that time the snow had receded on the Laramie plains, and the meadow ditches in Wyoming were taking water, but at the head of the Divide Ditch, they did not succeed in opening the ditch until June 3, 1933 (R. 776).

Complainant had offered in evidence its Exhibit No. 85 (R. 1160-1200), purporting to be the decreed appropriations of Sand Creek, and other creeks, in Wyoming. This decree is in the nature of an order, entered by the board of control of Wyoming, on Nov. 19, 1929, and each sheet thereof purports to be a decree for the ditch named therein. A part of these ditches take water from Sand Creek while others take from three or four other creeks whose appropriations would not be affected by the diversions of water by the Divide Dam. These various certificates are compiled in part on pages 52 and 53 of complainant's brief, but same omits several important facts pertaining to the appropriations of water, viz.: it fails to set forth the number of acres of land irrigated or permitted to be irrigated; they also omit the following provision of said decrees:

> "Appropriations are limited to the amount of water which is actually applied to beneficial uses which in the case of irrigation cannot exceed one cubic foot per second of time for each 70 acres of said land" (R. 1163).

Witness stated that he first figured up the number of acres of land stated in the permits or decrees of the ditches from Sand Creek proper, and found the total acreage therein stated was 4,840 acres, and that the total of the appropriations therefor was 70.73 sec. ft. That when he had surveyed the land actually irrigated under said ditches,

or that could be irrigated from them, he found only 2,980 acres (R. 777). This amount is 1,823 acres less than stated in said decrees. As the maximum amount of water is fixed at one second foot for 70 acres, it would require only 42 sec. ft. to irrigate the land actually irrigated, and that would be the limit of the amount of water required under the provisions of said decrees.

This witness testified that he and his associates proceeded to measure the irrigated lands under each ditch and the amount of water being diverted by each ditch, the amount of water in Sand Creek, at the Wyoming line, the accretions from all sources, and the diversion from all sources, and the amount of increase and decrease, between stations, and the final result obtained at the end of Sand Creek. That they prepared a map, defendant's Exhibit E-2, which is shown (R. 1547), which map shows the result of their investigation and was used by witness in explaining his testimony as to what they ascertained. Witness testified that he established seven measuring stations on Sand Creek, beginning at the Wyoming line and ending at the terminus of Sand Creek, near the Laramie River. That he used letters to designate the stations on the map and the point of measurement is indicated by a double circle. The first or upper station is marked "measuring station A," and is located close to the Wyoming line, in Sec. 13. The next station "B" is located in Sec. 25 near head of Lone Tree Ditch; the next is "C," located in Sec. 11 by a bridge on county road; the next is "D" in Sec. 26; the next is "E" in Sec. 19; the next is "F" west of Creighton Lake; and the last is "G," a short distance south of the Laramie River. After establishing said stations I measured the water at each station with a current meter, and marked the station with a stake. There was considerable diurnal fluctuation because of freezing at night and melting in day-time (R. 783-784). This witness further testified in effect:

In making our measurements of water in the creek we started at station "A," where we found 69.87 sec. ft. on May 30, 1933. There was an accretion from Running Water Creek of 2.23 sec. ft., which made the total 72.10 sec. ft. of water, between stations "A" and "B." In this section, Collins Ditch No. 1, was diverting 13.64 sec. ft., and Collins No. 4 Ditch 7.83 sec. ft., Knold Ditch 8.4 sec. ft., which made a total diversion of all ditches in that section of 32.87 sec. ft. We measured all the water in Sand Creek at the end of that station, and there was 70.51 sec. ft.; in other words, the diminution of the waters of Sand Creek from station "A" to "B" was only 1.59 sec. ft., although 4 ditches had diverted 32.87 sec. ft., from the creek. The result was accounted for by the fact that the ditches were close to the creek and that the water diverted returns very quickly and finds it way back to the stream. A very large part was running back on the surface of the ground and the rest was returning through the sub-soil and gravel. The meadows are cut up with depressions which lead back to the stream and when the water is turned out of the ditches, it finds its way into these depressions, and back to Sand Creek, as water running on the surface of the ground (R. 784-785).

We measured the water in the creek at each of the other stations and all additions from any source, and all diversions by the ditches, from station "A" to station "G." Starting with 69.87 sec. ft. at station "A," and when we arrived at station "G" there was only 1.24 sec. ft. less water than when at station "A" (R. 786). A photograph of the method of irrigation of meadows was taken near the head of Red Ditch, which is Exhibit N-2 (R. 1555). This picture was taken the first week in June and correctly shows the situation and is a fair representation of the method of irrigating meadows by these ditches on Sand Creek (R. 768).

On June 17 and 18, 1933, we returned when there was less water in the creek, and took measurements at stations

"A," "C" and "F.". There was 23.96 sec. ft. in Sand Creek at station "A" and the accretion from Running Water Creek was one-half of a second foot, and from Alkali Creek 3.72 sec. ft., making the total water 28.18 sec. ft. At that time there were 8 ditches diverting an aggregate of 39.91 sec. ft. between stations "A" and "C," and 25.05 sec. ft. were left in the creek. In fact all the water had returned except 3.13 sec ft. (R. 787).

We measured from station "C" to "F." Starting with 19.8 sec. ft. at station "C" and found that 10 ditches diverted an aggregate of 34.21 sec. ft. of water and at station "F" there remained in the creek 2.19 sec. ft. The total amount diverted by the ditches for the entire distance was 64.22 sec. ft., although the amount at station "A" was only 28.19 sec. ft. (R. 787-788). This shows that it requires only a small amount of water to satisfy these diversions.

There was quite a large ditch diverting from Sand Creek but on inquiry could not find its name so named it "unknown ditch." It is located near the north line of Sec. 2, T. 13, N. R. 75. It is shown on map. This ditch has a very good concrete dam and is such that it can divert all of the waters at that point. A picture was taken of its headgate, defendant's Exhibit O-2 (R. 1556). Inquiry was made of the water commissioner, Mr. Widman, and he did not know the name of the ditch. And also at the State Engineer's office in Cheyenne and they informed me there was no such ditch; that they had no record, permit or map showing the same. The first time this ditch was diverting 12.5 sec. ft., and it was being carried over into the Antelope country, so none of the water would return to Sand Creek. The second time the amount of water being diverted was .84 sec. ft. (R. 789).

A few of the ditches had some sort of headgate, some had make-shift dams, but none had weirs. There was no means of measuring water in any of these ditches except

it could be done by meter measurements. Witness stated (R. 790) that he made photographs of the heads of the Nedart Ditch, Red Ditch, Cook Ditch, Braden Ditch and other ditches, which show entire lack of headgates or measuring devices. These photographs are defendant's Exhibits P-2, Q-2, R-2 and T-2, and same are shown (R. 1558-1562).

This witness testified that when he was making said measurements the James Hardman Ditch No. 2, the LeRoy Ditch, the Davis Brothers No. 2 and Alice Hardman Ditch, and Davis Brothers Sand Creek No. 2 Ditch, were all drawing water, in the aggregate of 16.8 feet or more. These are the same 4 ditches concerning which Bruce G. Eaton testified that he had purchased the farms with said ditches and appropriations of water and resold the land in 1906 and 1907, but in his deeds therefor, he specifically reserved the appropriations of water, and thereafter diverted said appropriations at the Divide Dam (R. 769-774). The deeds conveying said lands and water rights to Mr. Eaton are Exhibits X-1, Y-1, and Z-1 (R. 1525-1527, 1529). The deed from Bruce G. Eaton to Lemuel E. Cook is dated Nov. 24, 1906, and specifically reserves the water rights and appropriations for the lands sold him, Exhibit A-2 (R. 1533). The deed from Bruce G. Eaton to Franklin P. Mason dated Dec. 20, 1907, conveying land but reserving the water rights and appropriations of water is Exhibit B-2 (R. 1535). The deed from Bruce G. Eaton to James M. Hoge, Exhibit C-2, reserving the water rights and appropriations of water is shown (R. 1539). The water rights and appropriations of water so reserved have since said deeds been transferred and diverted at the Divide Dam. These sales with reservations of water and transferred to the Divide Dam, separated said water from said land, and diminished the amount of water necessary to irrigate the lands from Sand Creek in Wyoming.

As we have before shown by reason of there being only 2,980 acres of land actually irrigated, the total amount of priorities of these ditches was reduced from 70 sec. ft. to 42 sec. ft., under the restriction of one sec. ft. for 70 acres of land. Deducting the 16.8 sec. ft. reserved in said deeds, would leave about 25 sec. ft. as the amount required for the remaining ditches, which is practically the amount witness Stimson found was sufficient to irrigate all of the lands under said ditches, and leave a residuum after all of said ditches were fully supplied. The record shows that if at any time these ditches were short of water and requested Mr. Eaton to turn down water to them, which the evidence showed only occurred four times in the eleven years, he always turned down the water. These demands occurred when there was little water in the creek and he gave them all there was.

Oda Mason, witness for complainant, on rebuttal testified that he became owner of the Hoge land which Bruce G. Eaton had conveyed, reserving the water; also that his father, Franklin P. Mason, acquired lands from Bruce G. Eaton and by the deed the water rights were reserved. This witness testified that all these years he had known that Mr. Eaton had reserved appropriations of water by said deeds, and that applied not only to his own but his father's lands. That everyone in the neighborhood was familiar with the reservations in the deed, and that Eaton had diverted the said appropriations of water at the Eaton dam; that he knew that the water had been reserved and transferred in 1907 (R. 888-889). "When I bought my land I understood the water rights had been reserved by Eaton, and he was diverting it at the Divide Ditch." He stated that he had used water continuously on his land and claimed it was the old priorities for said ditches, and admitted he was unlawfully diverting the same, well knowing that appropriations and priorities had been reserved by Mr. Eaton in said deeds (R. 891-892).

Not only this witness but all purchasers of said land had constructive notice of said reservations by the records of said deeds and had actual knowledge of said reservations. Whatever was reserved they never acquired or owned, and the title to said reserved water rights remained in Mr. Eaton until he conveyed the same to the company. If the owners of said lands subsequently diverted and used water from said four ditches, it must have been under a new appropriation, and of a date later than 1907, and such appropriations, if any there be, are junior to that of the Wilson Supply Ditch, and it is not required to turn down water for said after-acquired appropriations.

At the time when these deeds were made and the appropriations of water for these four ditches were specifically reserved therein, it was the rule under the laws and decisions of the Supreme Court of Wyoming, that a water right was property, distinct from the land on which it had been used; that it could be sold separate from the land; that it could be changed to a new point of diversion, and a new place of use. Therefore, the reservations in said deeds of said appropriations of water, were reservations of property, distinct and separate from the lands sold, and that the property rights so reserved, could be taken and used elsewhere. It was lawful to reserve said water rights, and the purchasers by accepting deeds with said reservations acquired no appropriations of water for said land, nor could they lawfully resume the use thereof on said land when they knew that same had been transferred to the Wilson Supply Ditch, and had been used there, now for more than 25 years. What is reserved in a deed is never conveyed thereby, and the purchaser never acquired any right to the property so reserved.

Frank v. Hicks, 4 Wyo. 502, 528; 35 Pac. 475, 480.

McPhail v. Forney, 4 Wyo. 556, 560; 35 Pac. 773.

Johnston v. Little Horse Creek I. Co., 13 Wyo. 208, 226; 79 Pac. 22, 24.

Groo v. Sights, 22 Wyo. 19, 30; 134 Pac. 269, 272.

In the first two cases above cited, the Wyoming Supreme Court fully discussed the nature of a water right, and held it was property; that the land was one kind of property, and the water right a separate kind of property; and that water rights can be severed from land where formerly used.

In Johnston v. Irr. Co., *supra*, the Court again reviewed and discussed the nature of a water right, or an appropriation of water, and held that it was property separate from the land and referred with approval to the two former cases. In that case the Court was called upon to determine the effect of the then Wyoming statute, and rulings of the State Engineer, and other water officials on the question; and the Court specifically held that the State Engineer and water officials were without authority to rule that the water rights were not severable from the land and further held that there were no provisions of the statutory law prohibiting severing the water rights from the land, and that their adjudication act did not have that effect; and concerning an act of the legislature passed in 1909, being Session Laws of 1909, Chapter 68, Sec. 1, which it was claimed in that case made the water right inseparable from the land, the Court said that the legislative attempt to change the settled rule should be clearly expressed and expressed a doubt whether the statute was sufficiently clear in that respect. So that it seems to be yet unsettled whether the legislature has power to say that a water right which is property cannot be separated from the land where originally used. In any event water rights reserved in

these deeds were reserved prior to the enactment of said statutes and the change of point of diversion from said four ditches to the Wilson Supply Ditch had been made in conformity to the then existing rule prior to 1909.

In this case, neither the present owners of the lands conveyed, from which the appropriations of water were reserved, nor their grantees, can lawfully claim that they are now the owners of the old original appropriations of water. They bought the lands from Mr. Eaton at a reduced price, not half of what he paid for the lands and water rights, because Mr. Eaton desired to and specifically reserved the water rights, and all purchasers knew it. Having so purchased the lands without water, equity will not permit them to now assert that they own the old original appropriations of water, and thereby seek to deprive Mr. Eaton and his irrigation company of the use and enjoyment thereof, in the Wilson Supply Ditch, where they have used the same, since 1907.

If his grantees of the land have been diverting water at the head of the old ditches, such acts are unlawful, because they never owned the old appropriations. If they have any rights to the use of water in said old ditches, their rights are those of an appropriator junior to the Wilson Supply Ditch, and also junior to the other ditches on Sand Creek in Wyoming, and they, not the Wilson Supply Ditch, have been interfering with the lawful rights of the other ditches; and they should be closed down prior to any call on the Wilson Supply Ditch. He that seeks equity should do equity, is one of the familiar rules that can well be applied here.

XI.

The State of Wyoming has No Just Cause for Complaint If the Alleged Decrease in the Annual Stream Flow of the Laramie River at the State Line is Due to Natural Conditions, and Not to Increased Uses of Colorado Appropriations, Beyond the Amount Allocated by the Decree of This Honorable Court.

Complainant's brief contains a subdivision, Point VII (pp. 41 to 50), with the caption, "Water Supply," and at page 45 of this subdivision, it is said:

> "The question at issue in the case at bar is not to determine what the available supply is, but to determine if Wyoming is being denied any water that is available to which she is entitled under the former decree, by reason of Colorado taking more than she is lawfully entitled to. The available water supply to meet the demands of both Colorado's recognized appropriations and Wyoming's appropriations is not now open to question."

We are in full accord with this statement. Whatever variations there may be in stream flow will not affect the amount of water to be diverted by Colorado, as a matter of right under the decision of this Court.

> Wyoming v. Colorado, 259 U. S. 419; 66 L. Ed. 999.

We have elsewhere discussed in this brief the question at issue, i. e., whether or not Colorado has materially and substantially injured Wyoming by the diversion of more water from the Laramie River than she may lawfully do under the decree of this Court. The question has been discussed in detail with respect to the several appropriations within this State. Apparently, Wyoming, by showing a decrease in the flow of the river during the last ten years, seeks to raise an inference that the reason for the

depreciated water supply is because of excess diversions in Colorado. The burden, however, is upon Wyoming to prove this fact.

Wyoming's water shortage from the Laramie in recent years, like that of Colorado, and like that of all the eastern slope of the Rocky Mountains, has been due to other causes than Colorado's diversions of water from the Laramie River. It is now common knowledge that a series of years of protracted drouth prevailed in the years involved over the watershed of the Missouri River, unprecedented in duration and in severity (R. 866).

In the former case of Wyoming v. Colorado, 259 U. S., at 485, and in the later case, 286 U. S., at page 503, this Court found:

> "That at Woods (Wyoming) a gauging station near the Colorado-Wyoming state line the natural flow of the Laramie, after the recognized Colorado appropriations are satisfied, is such as to afford an available supply of 170,000 acre feet per year, but not more; that the stream receives below Woods contributions of 93,000 acre feet from the Little Laramie and 25,000 acre feet from smaller affluents, making the entire available supply 288,000 acre feet, apart from the quantities required to satisfy the recognized Colorado appropriations; * * *."

Complainant in an attempt to show (1) that the average annual flow of the Laramie River has largely decreased since the entry of the decree in the former case, and, (2) that such decrease below the available supply, as found by the Court in the 1922 decree, was due to unlawful increased used by Colorado appropriators, introduced Exhibits 35 and 54, prepared respectively by witnesses Nelson and Meeker (R. 224, 267 and 1006, 1060).

It will be noted that the table contained in Exhibit 35 covers the period 1911 to 1932, and is divided into two

parts, one from 1911 to 1924, inclusive, and the other from 1925 to 1932, inclusive (R. 1006). The mean, as there appears, for the partial period 1911 to 1924 is 168,000 acre feet, which amount is then "used as a yardstick" to measure the runoff for all the other years. This indicates according to this method of calculation that between 1925 and 1932, the total water supply at Woods Station in Wyoming was 128.4% of 168,000 acre feet less than it would have been had the runoff been of the same character as occurred during the 1911 to 1924 period. The fallacy of including the years of exceptionally low runoff, namely 1925, 1930, 1931 and 1932, in such a short period as that of 1925 to 1932 is manifest, and such method results in distorting and unduly increasing the percentage of deviation from the mean or average runoff (Testimony R. J. Tipton. R. 867-868).

In assessing the value to be placed upon complainant's Exhibit 35, witness Tipton says:

> "It could not properly be inferred from (this exhibit) that the large indicated deficiency of 128.4% occurring from 1925 to 1932, and based on the 1911 to 1924 mean was due to excessive uses or unlawful uses, of the Laramie River water by Colorado appropriators" (R. 868).

In this connection, attention is called to the assertion made by counsel for Wyoming at page 43 of its brief that witness Tipton states: "That Colorado uses are increasing."

That such partial statement is obviously misleading clearly appears when the complete sentence is examined and which reads:

> "There is no question but what some of the decreased flow was due to increased uses by Colorado users, since the Laramie-Poudre Tunnel has gradually increased its diversions, but as yet those

diversions have not reached the 15,500 acre feet allocated to the Tunnel by the Court" (R. 868).

In order to show that the decrease in the mean runoff at Woods on the Laramie, thus ascertained by the same method of calculation, was not alone confined to the Laramie River, reference is here made to defendant's Exhibit Q-3 (R. 1624), and the testimony of witness Tipton at page 870. This Exhibit indicates that by using the mean runoff for the period 1911 to 1924, as a "yard stick," the accumulated deficiency from 1925 to 1932 in the Cache la Poudre Basin was 145.1% as compared to the accumulated deficiency in the Laramie River Basin of 128.4% as indicated in complainant's Exhibit 35 (R. 870).

Likewise defendant's Exhibit R-3, prepared in exactly the same manner as complainant's Exhibit 35, with respect to the Arkansas River the next major stream rising in Colorado on the east side of the Rocky mountains, shows that the accumulated variation from the 1911 to 1924 mean to have been 159.3% as compared with the accumulated deficiency of 128.4% in the Laramie River Basin (R. 1624 and R. 871).

And defendant's Exhibit S-3, at page 1625 of the Record, which was prepared in the same manner as complainant's Exhibit 35, indicates an accumulated deficiency at the end of 1932, on the Rio Grande River in Colorado, based on the mean for the period 1911 to 1924, to be 113.8% compared with accumulated deficiency of 128.4% in the Laramie River Basin (R. 872).

Thus it appears that on all the major streams in Colorado, namely the Cache la Poudre, the Arkansas and the Rio Grande River, as indicated by defendant's Exhibits Q-3, R-3 and S-3, respectively, the source of which was substantially the same as the Laramie River, there was an accumulated deficiency of approximately the same percentage covering the same period of time. Furthermore,

such deficiency was in each instance not due to increased uses, but to a period of low runoff covering all the Rocky Mountain area.

The testimony of witness Tipton (R. 874), which is based upon defendant's Exhibit J-3 (R. 1615), shows that Colorado users had only 86% of the aggregate allocation of 37,750 acre feet in the period 1925 to 1932, while the Wyoming users had available to them out of the Laramie River an average during the same period of 97% of the 154,500 acre feet, the same being the long time mean (Complainant's Exhibit 54, R. 1060 and R. 874).

We respectfully submit that Wyoming wholly failed to prove a substantial and material diminution in the water supply, to have been caused by Colorado or by any of her appropriators.

CONCLUSION.

It is, therefore, respectfully submitted, for the reasons hereinbefore set forth, that the State of Wyoming has failed to sustain the allegations contained in her amended Bill of Complaint, and that the same should be dismissed and the State of Colorado recover her costs herein expended.

Respectfully submitted,

PAUL P. PROSSER,
Attorney General
of the State of Colorado,
SHRADER P. HOWELL,
Assistant Attorney General
of the State of Colorado,
Solicitors for Defendant.

Of Counsel.

SUPREME COURT OF THE UNITED STATES.

No. 15, Original.—October Term, 1931.

The State of Wyoming, Complainant,
vs.
The State of Colorado, Defendant.
} In Equity.

[May 31, 1932.]

Mr. Justice Van Devanter delivered the opinion of the Court.

This is a suit brought by the State of Wyoming against the State of Colorado to enforce a decree of this Court (259 U. S. 419, 496; 260 U. S. 1,) rendered in an earlier suit between the same States respecting their relative rights to divert and use for irrigation the waters of the Laramie River, a stream rising in Colorado and flowing northward into Wyoming.

In the present bill, shortly described, Wyoming alleges that Colorado is departing from that decree by permitting the diversion and use within her territory of waters of the Laramie in quantities largely in excess of those accorded to her by the decree; that these excessive diversions are preventing Wyoming from receiving and using the amount of water which the decree accorded to her; that Colorado, unless restrained by this Court, will continue to permit such excessive diversions and thereby will largely or entirely deprive Wyoming of the use of the water accorded to her in the decree; that the measuring devices installed by Colorado to measure the waters diverted within her territory do not accurately show the full quantities so diverted; and that Colorado refuses, although duly requested, to permit Wyoming to install other suitable devices or participate in the measurements.

The bill construes the decree as determining the rights of the two States in the waters of the Laramie by according to Colorado

1. 18,000 acre feet of water per annum by reason of the Skyline ditch appropriation;

2. 4,250 acre feet of water per annum by reason of certain meadowland appropriations;

3. A relatively small amount of water appropriated prior to 1902 through the Wilson Supply ditch from the headwaters of Deadman Creek, a Colorado tributary of the Laramie; and

4. 15,500 acre feet of water per annum by reason of the Laramie-Poudre tunnel appropriation, making an aggregate of 37,750 acre feet per annum, apart from the Wilson Supply ditch appropriation;

and by according to Wyoming 272,500 acre feet of water per annum by reason of appropriations in that State.

The relief sought is the protection and quieting of Wyoming's rights under the decree; provision for accurately and effectively measuring and recording the quantities of water diverted in Colorado; an injunction restraining Colorado from continuing or making any diversion in excess of the quantities of water accorded to her by the decree—in the event the injunction in that decree is held to relate only to diversion by reason of the Laramie-Poudre tunnel appropriation; and such other and full relief as may be just and equitable.

Colorado challenges the bill by a motion to dismiss in the nature of a demurrer. The principal grounds of the motion are, (1) that the bill proceeds upon the theory that the prior decree determined, as against Colorado and her water users, the full quantity of water which rightfully may be diverted from the stream within that State, and likewise the quantity which Wyoming and her water users are entitled to receive and use from the stream within that State—all of which, it is insisted in the motion, is refuted by the record, opinion and decree in the prior suit; (2) that the bill shows that the acts complained of are not acts done by Colorado, or under her authority, but acts done by private corporations and individuals not parties to the present suit and with respect to which no relief can be had against Colorado; and (3) that, in any event, the bill fails to show with certainty any violation of the decree or any damage to Wyoming or her water users.

In the bill, Wyoming does take the position that the decree in the earlier suit determines the rights of each State as against the other, including their respective water users, respecting the diversion and use of the waters of the interstate stream—in other words, that the decree fixes and limits the quantities of water which Colorado, including her water users, is entitled to divert and use within that State and thus withhold from Wyoming, and likewise determines the amount of water which Wyoming, including her water users, is entitled to receive and use within her territory. Counsel for Colorado, recognizing that such is the position taken in the bill, say in their brief: "The principal purpose of the motion

to dismiss is to join issue with the contention of the complainant that the whole matter has already been adjudicated by the former decree. The problem so presented is a law question and it is apprehended that this should be determined *in limine*". And, after indicating Colorado's purpose to answer if so required, they further say: "We insist, however, that the cause will be greatly accelerated and confusion be avoided by determining at the threshold the issues of law tendered by the complainant, and thereupon the issues of fact should be defined, if any are considered to stand for adjudication after passing upon the construction problem, which is the only substantial controversy in the case." Evidently therefore the construction of the decree in the earlier suit is the chief matter in dispute.

That suit was brought by Wyoming against Colorado and two Colorado corporations. The corporations, with Colorado's authority and permission, were proceeding to divert water from the Laramie in Colorado and to conduct it through a proposed tunnel into the valley of the Cache la Poudre in Colorado, there to be used in irrigation. The project was designed to divert from the Laramie 56,000 acre feet per annum at first and 15,000 more later on. The purpose of the suit was to prevent the proposed diversion, and to that end the complaint set forth, among other things, that the doctrine of appropriation for beneficial use, whereby priority in time gives priority in right, was recognized and applied by both Colorado and Wyoming in adjusting conflicting claims to the use of waters of natural streams; that Wyoming and her citizens had been for many years irrigating and thereby making highly productive very large amounts of land along the Laramie and its tributaries in that State through the use of waters appropriated for that purpose from those streams, and expenditures running into millions of dollars had been made in the construction of reservoirs, canals and other appliances for the purpose of so using such waters; that these appropriations and this use had been maintained from a time long prior to the commencement of the Laramie-Poudre tunnel project in Colorado; that the date when that project was commenced was "on or about the first day of December, 1909"; that before that project was commenced Colorado and certain of her citizens had appropriated water from the Laramie in Colorado for the irrigation of lands (meadow lands) in that State adjacent to that stream,

but that the total amount of water reasonably and beneficially used upon such lands did not exceed 6,000 acre feet per annum; that "no other appropriations or use of said waters of said Laramie River or its tributaries had been made by the State of Colorado or its citizens, or within the said State of Colorado, prior to the appropriations of said waters by your orator and its citizens as herein set forth"; that prior to the commencement of the Laramie-Poudre tunnel project in Colorado Wyoming and her citizens had appropriated all of the available waters of the Laramie and its tributaries for the actual irrigation of lands in Wyoming aggregating hundreds of thousands of acres and supporting thousands of people; that without the use of the waters so appropriated these lands would be to a large extent valueless and incapable of supporting any considerable population; and that the consummation of the proposed Laramie-Poudre tunnel diversion would deprive Wyoming and her citizens of a very large amount of water to the use of which they were rightly entitled in virtue of their appropriations, and would take from many of their lands much of their value.

The prayer was for an injunction preventing the defendants and each of them from making the proposed diversion, and for general relief.

Colorado, in answering the complaint, admitted that before the commencement of the Laramie-Poudre tunnel project certain of her citizens had appropriated water from the Laramie and its tributaries in that State for the irrigation of adjacent lands (meadow land), but averred that these appropriations amounted to about 8,000 acre feet per annum; alleged that "other appropriations of said waters of said Laramie River and its tributaries had been made by the State of Colorado and its citizens within the State of Colorado prior to the appropriations of said waters by complainant and its citizens"; averred that the right to the proposed Laramie-Poudre tunnel diversion was initiated, by commencement of construction, August 25, 1902, and that at the time of such initiation there was abundant water in the Laramie to satisfy all prior appropriations then in existence in Colorado and Wyoming; denied that Wyoming and her citizens had appropriated all of the available waters of the Laramie and its tributaries prior to that threatened diversion, and averred that there was ample water in those streams to supply the threatened diversion and all

prior rights in Wyoming; alleged that when the right to make that diversion was initiated, the appropriations effected or initiated in Wyoming did not exceed 50,000 acre feet; averred that the maximum diversion which could be made through the Laramie-Poudre tunnel project did not exceed 70,000 acre feet annually, and the topographical and physical conditions were such that "by the system sought to be enjoined herein, and all other available means, no more than 90,000 acre feet annually can be diverted from said stream and its tributaries for use upon lands lying within the State of Colorado"; and denied that the consummation of the threatened diversion would work any injury to Wyoming or her citizens or the lands in that State.

Thus the pleadings directly put in issue the priority and measure of the appropriations in each State as against those in the other State, and also the extent of the available supply of water whereon all of the appropriations depended.

Evidence was produced by both States directly bearing upon these issues. Colorado's evidence was addressed to showing all appropriations in that State, not merely the Laramie-Poudre tunnel appropriation; and that evidence dealt in detail with the dates and measure of the meadow-land appropriations referred to in the complaint and answer; with the existence, date and measure of the Skyline ditch appropriation and the Wilson Supply ditch appropriation; and even with an appropriation from Sand Creek, a small interstate stream nominally but not actually a tributary of the Laramie. Colorado's state engineer gave 4,250 acre feet per annum as the measure of the meadow-land appropriations, 18,000 acre feet per annum as the measure of the Skyline ditch appropriation, and 2,000 acre feet per annum as the measure of the Wilson Supply ditch appropriation. Some of her witnesses gave different measures. All who spoke of the Wilson Supply ditch agreed that it was used to divert water from the headwaters of Deadman Creek, a Colorado tributary of the Laramie, into Sand Creek, from which that water, or its equivalent, was rediverted at a lower point, along with other water from Sand Creek, through the Divide ditch and ultimately carried into the Cache la Poudre valley. Colorado's evidence indicated that the meadow-land, Skyline and Wilson Supply appropriations were earlier than the Laramie-Poudre tunnel appropriation and many of the Wyoming appropriations;

and Wyoming recognized this difference in the dates of appropriation, although raising some question as to the quantity of water in the earlier appropriations so recognized.

In their briefs in that suit counsel for Colorado, while urging that the doctrine of appropriation was not applicable to a controversy between the two States, but only to controversies between private appropriators within the same State, recognized that the Court might hold otherwise; and on that basis they presented what they termed "a complete review of the evidence showing the respective priorities of diversion from the Laramie River in Colorado and Wyoming". In that review they listed the aforementioned meadow-land, Skyline, Wilson Supply and Sand Creek appropriations and the proposed Laramie-Poudre tunnel appropriation, as constituting the "diversions and use by Colorado and her citizens", and urged that Colorado be recognized as entitled to all of them under the rule of priority, if that rule was given effect.

With the issues, evidence and propositions of law here outlined submitted to it, the Court proceeded to a decision.

The influence to be given to the doctrine of appropriation was much considered, as the opinion shows, and in disposing of that question the Court said (259 U. S. 467, 468, 470):

"The lands in both States are naturally arid and the need for irrigation is the same in one as in the other. The lands were settled under the same public land laws and their settlement was induced largely by the prevailing right to divert and use water for irrigation, without which the lands were of little value. Many of the lands were acquired under the Desert Land Act which made reclamation by irrigation a condition to the acquisition."

. . . . .

"In neither State was the right to appropriate water from this interstate stream denied. On the contrary, it was permitted and recognized in both. The rule was the same on both sides of the line. Some of the appropriations were made as much as fifty years ago and many as much as twenty-five. In the circumstances we have stated, why should not appropriations from this stream be respected, as between the two States, according to their several priorities, as would be done if the stream lay wholly within either State? By what principle of right or equity may either State proceed in disregard of prior appropriations in the other?

"Colorado answers that this is not a suit between private appropriators. This is true, but it does not follow that their situation and what has been accomplished by them for their respective States can be ignored. As respects Wyoming the welfare, pros-

perity and happiness of the people of the larger part of the Laramie valley, as also a large portion of the taxable resources of two counties, are dependent on the appropriations in that State. Thus the interests of the State are indissolubly linked with the rights of the appropriators. To the extent of the appropriation and use of the water in Colorado a like situation exists there."

. . . . . .

"We conclude that Colorado's objections to the doctrine of appropriation as a basis of decision are not well taken, and that it furnishes the only basis which is consonant with the principles of right and equity applicable to such a controversy as this is. The cardinal rule of the doctrine is that priority of appropriation gives superiority of right. Each of these States applies and enforces this rule in her own territory, and it is the one to which intending appropriators naturally would turn for guidance. The principle on which it proceeds is not less applicable to interstate streams and controversies than to others.[1] Both States pronounce the rule just and reasonable as applied to the natural conditions in that region; and to prevent any departure from it the people of both incorporated it into their constitutions. It originated in the customs and usages of the people before either State came into existence, and the courts of both hold that their constitutional provisions are to be taken as recognizing the prior usage rather than as creating a new rule. These considerations persuade us that its application to such a controversy as is here presented cannot be other than eminently just and equitable to all concerned."

Respecting the available supply of water the Court found from the evidence that Sand Creek is nominally but not actually a tributary of the Laramie, and therefore not to be considered; that at Woods, a gauging station near the Colorado-Wyoming stateline, the natural flow of the Laramie after the "recognized Colorado appropriations" are satisfied is such as to afford an available supply of 170,000 acre feet per year, but not more; that the stream receives below Woods contributions of 93,000 acre feet from the Little Laramie and 25,000 acre feet from smaller affluents, making the entire available supply 288,000 acre feet, apart from the quantities required to satisfy the "recognized Colorado appropriations"; and that

"The available supply—the 288,000 acre feet—is not sufficient to satisfy the Wyoming appropriations dependent thereon and

[1]Followed and applied in Weiland, State Engineer of Colorado *v.* Pioneer Irrigation Co., 259 U. S. 498, 502.

also the proposed Colorado appropriation,[2] so it becomes necessary to consider their relative priorities.

"There are some existing Colorado appropriations having priorities entitling them to precedence over many of the Wyoming appropriations. These recognized Colorado appropriations are,[3] 18,000 acre-feet for what is known as the Skyline Ditch and 4,250 acre-feet for the irrigation of that number of acres of native-hay meadows in the Laramie valley in Colorado, the 4,250 acre-feet being what Colorado's chief witness testifies is reasonably required for the purpose, although a larger amount is claimed in the State's answer. These recognized Colorado appropriations, aggregating 22,500 acre-feet, are not to be deducted from the 288,000 acre-feet, that being the available supply after they are satisfied. Nor is Colorado's appropriation from Sand Creek to be deducted, that creek, as we have shown, not being a tributary of the Laramie."

From the evidence bearing upon the relative priorities of the proposed Colorado appropriation and the Wyoming appropriations the Court found that work on the former was begun in the latter part of October, 1909, and was prosecuted with such diligence that the appropriation should be accorded a priority as of the date when the work was begun; that some of the Wyoming appropriations were senior and others junior to that appropriation; that those which were senior to it and dependent on the common source of supply amounted to 272,500 acre feet per annum; and that

"As the available supply is 288,000 acre feet and the amount covered by senior appropriations in Wyoming is 272,500 acre feet, there remain 15,500 acre feet which are subject to this junior appropriation in Colorado."

After stating these findings, the Court's opinion concluded:

"A decree will accordingly be entered enjoining the defendants from diverting or taking more than 15,500 acre feet per year from the Laramie River by means of or through the so-called Laramie-Poudre project."

Thereupon a decree was entered declaring (259 U. S. 496):

"It is considered, ordered and decreed that the defendants, their officers, agents and servants, be, and they are hereby, sever-

[2]The reference is to the threatened Laramie-Poudre tunnel diversion.

[3]The Wilson Supply ditch appropriation should have been included here among the recognized Colorado appropriations and was included among them in a modified decree, as will appear later on.

ally enjoined from diverting or taking from the Laramie River and its tributaries in the State of Colorado more than fifteen thousand five hundred (15,500) acre-feet of water per annum in virtue of or through what is designated in the pleadings and evidence as the Laramie-Poudre Tunnel appropriation in that State,

"Provided, that this decree shall not prejudice the right of the State of Colorado, or of any one recognized by her as duly entitled thereto, to continue to exercise the right now existing and hereby recognized to divert and take from such stream and its tributaries in that State eighteen thousand (18,000) acre-feet of water per annum in virtue of and through what is designated in the pleadings and evidence as the Skyline Ditch appropriation in that State; nor prejudice the right of that State, or of any one recognized by her as duly entitled thereto, to continue to exercise the right now existing and hereby recognized to divert and take from such stream and its tributaries in that State four thousand two hundred and fifty (4,250) acre-feet of water per annum in virtue of and through the meadow-land appropriations in that State which are named in the pleadings and evidence; nor prejudice or affect the right of the State of Colorado or the State of Wyoming, or of any one recognized by either State as duly entitled thereto, to continue to exercise the right to divert and use water from Sand Creek, sometimes spoken of as a tributary of the Laramie River, in virtue of any existing and lawful appropriation of the waters of such creek."

Colorado and her co-defendants presented a petition for rehearing on stated grounds, one of which was that the Wilson Supply ditch appropriation was inadvertently omitted, in both opinion and decree, from the recognized early Colorado appropriations. As the omission was in fact inadvertent, the decree was then so modified as to include that appropriation among the others which Colorado was recognized as having a right to continue. 260 U. S. 1. A change in the provision respecting costs also was sought in the petition, and was included in the modified decree. In other respects the original decree was adhered to and a rehearing denied. In that petition Colorado and her codefendants construed the decree as allotting the available supply between the two States according to priority in appropriation and limiting Colorado's allotment "to 37,750 acre feet annually—Skyline 18,000, plus Colorado meadows 4,250, plus Laramie-Poudre 15,500".

We are of opinion that the record, opinion and decree in the prior suit, here reviewed at length, show very plainly that the decree must be taken as determining the relative rights of the two States, including their respective citizens, to divert and use the

waters of the Laramie and its tributaries. These rights were put in issue by the pleadings, displayed in the evidence, and considered and resolved in the opinion. Not only so, but the question of priority in time and right as between the appropriations in Colorado and those in Wyoming was directly presented by the pleadings and evidence and distinctly dealt with and resolved in the opinion.

As appears from the opinion, the Court held that the doctrine, long recognized and enforced in both States, whereby priority of appropriation gives superiority of right, furnished the only equitable and right basis on which to determine the controversy between them shown in the pleadings and evidence.

And as further appears from the opinion, the Court made specific findings showing the amount of water in the available supply, its insufficiency to satisfy all asserted appropriations, the date when the proposed tunnel appropriation in Colorado was initiated, the names and amounts of the appropriations in Colorado which were senior to that appropriation, the amount of water included in the Wyoming appropriations which were senior to it, and the amount which would remain in the supply and be subject to that appropriation after deducting what was required to satisfy the senior appropriations in both States.

These findings were pertinent to the issues, and upon them the Court pronounced its decree. Under a familiar rule the facts thus determined are not open to dispute in a subsequent suit between the same States.[4]

As before shown, the modified decree (1) restricts diversion under the Colorado tunnel appropriation to 15,500 acre feet, the amount which under the findings would remain in the supply after deducting the quantities included in the senior appropriations in both States; (2) recognizes and protects the Skyline appropriation of 18,000 acre feet, it being a senior Colorado appropriation; (3) similarly sustains the meadow-land appropriations of 4,250 acre feet, they being senior Colorado appropriations; (4) recognizes and protects the small Wilson Supply ditch appropriation made prior to 1902, it being a senior Colorado appropriation inadvertently omitted from the list in the opinion but given its proper place by a modification of the original decree; and (5)

[4]Southern Pacific R. R. Co. *v.* United States, 268 U. S. 1, 48; Southern Pacific R. R. Co. *v.* United States, 183 U. S. 519, 532.

saves from prejudice all appropriations of the waters of Sand Creek, found not to be a tributary of the Laramie.

The decree enjoins any diversion through the tunnel appropriation in excess of the 15,500 acre feet accorded to it—and this doubtless for the reason that there had been a declared and real purpose to divert from 56,000 to 71,000 acre feet under that appropriation. No showing appears to have been made indicative of any occasion at that time for a broader injunction. Of course, in the absence of such a showing, a broader injunction was not justified. Certainly the limited injunction which was granted does not warrant any inference that it marks the limits of what was intended to be decided. Such an inference would be inconsistent with other parts of the decree and with the opinion and the findings therein.

Construing the decree in the light of the record and opinion, to which counsel for both States appeal, we think it was intended to and does define and limit the quantity of water which Colorado and her appropriators may divert from the interstate stream and its tributaries and thus withhold from Wyoming and her appropriators.

But it is said that water claims other than the tunnel appropriation could not be, and were not, affected by the decree, because the claimants were not parties to the suit or represented therein. In this the nature of the suit is misconceived. It was one between States, each acting as a quasi-sovereign and representative of the interests and rights of her people in a controversy with the other. Counsel for Colorado insisted in their brief in that suit that the controversy was "not between private parties" but "between the two sovereignties of Wyoming and Colorado"; and this Court in its opinion assented to that view, but observed that the controversy was one of immediate and deep concern to both States and that the interests of each were indissolubly linked with those of her appropriators. 259 U. S. 468. Decisions in other cases also warrant the conclusion that the water claimants in Colorado, and those in Wyoming, were represented by their respective States and are bound by the decree.[5]

[5]Missouri *v.* Illinois, 180 U. S. 208, 241; Kansas *v.* Colorado, 185 U. S. 125, 142; s. c., 206 U. S. 46, 49; Georgia *v.* Tennessee Copper Company, 206 U. S. 230, 237; Hudson Water Company *v.* McCarter, 209 U. S. 349, 355; Pennsylvania *v.* West Virginia, 262 U. S. 550, 591, 595; North Dakota *v.* Minnesota, 263 U. S. 365, 373; Rhode Island *v.* Massachusetts, 12 Pet. 657, 748; Florida *v.* Georgia, 17 How. 478, 494, 510, 522.

The contention that the present bill shows that the acts complained of are not acts done by Colorado, or under her authority, but acts done by private corporations and individuals not parties to the present suit, is shown by the bill to be untenable. It is there alleged that Colorado in 1926 permitted a diversion from the Laramie through the Laramie-Poudre tunnel appropriation materially in excess of the 15,500 acre feet specified in the decree; that in 1926, 1927 and 1928, with the knowledge, permission and cooperation of Colorado, diversions were made from the Laramie and its tributaries through the Skyline ditch appropriation in stated amounts materially in excess of the 18,000 acre feet specified in the decree; that in 1926, 1927, 1928 and 1929, with the knowledge, consent and cooperation of Colorado, diversions were made from the Laramie and its tributaries through the meadowland appropriations in various amounts pronouncedly in excess of the 4,250 acre feet specified in the decree; and that Colorado has permitted other diversions from the Laramie and its tributaries in violation of the decree through the Bob Creek and other designated ditches, none of which were recognized or named in the findings or decree.

The contention that the bill fails to show with certainty any violation of the decree or any damage to Wyoming or her water users is largely refuted by the allegations just noticed, and is further refuted by an allegation that annually since the entry of the decree the amount of water in the Laramie available to Wyoming for its water users has been less than the 272,500 acre feet specified in the Court's findings, and this shortage has been caused by the excessive and otherwise unlawful diversions before described. It is true that some of the allegations purporting to state violations of the decree are uncertain and indefinite, but there are many which are not subject to this criticism, and plainly there is enough in the bill to require that the defendant be called upon to answer it.

An order will be entered overruling the motion to dismiss, permitting Wyoming to amend her bill within thirty days by making some of its allegations more definite and certain, if she be so advised, and permitting Colorado to answer the bill or amended bill, as the case may be, on or before the first day of September. next.

Motion to Dismiss Overruled.

SUPREME COURT OF THE UNITED STATES.

No. 10, Original.—October Term, 1935.

The State of Wyoming, Complainant,
vs.
The State of Colorado.
} In Equity.

[June 1, 1936.]

Mr. Justice Van Devanter delivered the opinion of the Court.

By this suit the State of Wyoming complains of the State of Colorado and asserts that the latter and her water claimants have been and are departing from a decree rendered by this Court in an earlier suit between these States (259 U. S. 419, 496; 260 U. S. 1,) and that the asserted departures have been and are working material injury to Wyoming and her water claimants. The principal relief sought is an injunction enforcing adherence to that decree.

The earlier suit and decree dealt with the relative rights of the two States and their respective water claimants to divert and use for irrigation the waters of the Laramie River, an innavigable stream which has its source in the mountains of northern Colorado, flows northerly 27 miles in that State, crosses into Wyoming, and there flows northeasterly 150 miles to the North Platte River, of which it is an affluent. That suit was largely provoked by a proposed and threatened diversion in Colorado (called the Laramie-Poudre Tunnel Project) of 50,000 acre feet or more from the Laramie River, which Wyoming alleged would not leave in the river sufficient water to satisfy older appropriations in that State.

Shortly after the present suit was begun the complainant's right to relief was challenged by a motion to dismiss, one ground of which was that the suit proceeds on the erroneous assumption that the earlier decree determined, as against Colorado and her water claimants, the full quantity of water which rightly may be diverted within that State from the stream, and likewise the quantity which Wyoming and her water claimants are entitled to receive and use within her borders. The motion was overruled (286

U. S. 494), the scope of the ruling and the reasons for it being shown in the following excerpts from the opinion then delivered.

"We are of opinion that the record, opinion and decree in the prior suit, here reviewed at length, show very plainly that the decree must be taken as determining the relative rights of the two States, including their respective citizens, to divert and use the waters of the Laramie and its tributaries. These rights were put in issue by the pleadings, displayed in the evidence, and considered and resolved in the opinion. Not only so, but the question of priority in time and right as between the appropriations in Colorado and those in Wyoming was directly presented by the pleadings and evidence and distinctly dealt with and resolved in the opinion.

"As appears from the opinion, the Court held that the doctrine, long recognized and enforced in both States, whereby priority of appropriation gives superiority of right, furnished the only equitable and right basis on which to determine the controversy between them shown in the pleadings and evidence.

"And as further appears from the opinion, the Court made specific findings showing the amount of water in the available supply, its insufficiency to satisfy all asserted appropriations, the date when the proposed tunnel appropriation in Colorado was initiated, the names and amounts of the appropriations in Colorado which were senior to that appropriation, the amount of water included in the Wyoming appropriations which were senior to it, and the amount which would remain in the supply and be subject to that appropriation after deducting what was required to satisfy the senior appropriations in both States.

"These findings were pertinent to the issues, and upon them the Court pronounced its decree. Under a familiar rule the facts thus determined are not open to dispute in a subsequent suit between the same States."

And again:

"Construing the decree in the light of the record and opinion, to which counsel for both States appeal, we think it was intended to and does define and limit the quantity of water which Colorado and her appropriators may divert from the interstate stream and its tributaries and thus withhold from Wyoming and her appropriators.

"But it is said that water claims other than the tunnel appropriation could not be, and were not, affected by the decree, because the claimants were not parties to the suit or represented therein. In this the nature of the suit is misconceived. It was one between States, each acting as a quasi-sovereign and representative of the interests and rights of her people in a controversy with the other.

. . . the water claimants in Colorado, and those in Wyoming, were represented by their respective States and are bound by the decree."

The earlier decree, so construed, confirms and establishes "the right of the State of Colorado, or of any one recognized by her as duly entitled thereto", to divert and take within that State

(1) 18,000 acre feet of water per annum from the Laramie River and its tributaries in virtue of the Skyline Ditch appropriation;

(2) 4,250 acre feet of water per annum from such stream and its tributaries in virtue of certain meadowland appropriations;

(3) The relatively small amount of water appropriated prior to 1902 from the headwaters of Deadman Creek, a tributary of the Laramie River, through the Wilson Supply Ditch;

(4) 15,500 acre feet of water per annum from the Laramie River and its tributaries, in virtue of the Laramie-Poudre Tunnel appropriation;

and that decree also confirms and establishes the right of the State of Wyoming and her water claimants to receive and divert within that State the remaining waters of the stream and its tributaries in virtue of appropriations prior in time and right to the tunnel appropriation in Colorado. A further provision in the decree enjoins the defendant State from diverting or taking from the river and its tributaries in virtue of the tunnel appropriation any water in excess of the confirmed right to 15,500 acre feet per annum, the reason for limiting the injunction to that appropriation being that there was no showing of an exigency requiring that it be broader.

In this view of the earlier suit and decree, we further held, in overruling the motion to dismiss the present suit, that the bill contains allegations of such material departures by Colorado and her water claimants from the earlier decree that she should be called upon to answer. Colorado did answer; evidence was then taken and reported by commissioners; and the cause has since been submitted on briefs and oral argument.

The departures from the decree which are charged against Colorado in the bill are of two classes—one comprising diversions under claims not confirmed or recognized in the decree, and the other consisting of diversions under each of the confirmed Colorado claims of more water than the decree accredits to the claim. In the answer

Colorado denies that certain of the diversions have been excessive or otherwise contrary to the decree, and admits that other designated diversions have not been in accord with the decree as construed in our opinion overruling the motion to dismiss, but asserts that they have been made in good faith and in accord with what the State's officers have understood the decree to be.

One complaint is of diversions through what are described in the bill and answer as Bob Creek ditch, Bob Creek extension ditch, Columbine ditch, and Lost Lake Reservoir system. These diversions are admitted in the answer. They are made, not under claims recognized or confirmed in the decree, but quite independently of it. Under the decree, as is pointed out in our opinion overruling the motion to dismiss, the Colorado claims which the decree recognizes and confirms are the only ones in virtue of which diversions may be made as against Wyoming and her appropriators. Claims not so recognized and confirmed are excluded. It follows that the diversions just described contravene the decree and infringe Wyoming's rights under it. They were being practiced when the present suit was begun and for a time thereafter, but when the motion to dismiss was overruled they were discontinued pending further action by us. Counsel for Colorado now assure us in their brief that the State does not propose to permit a resumption of these diversions if we hold, as we now do, that they contravene the decree. Because of this assurance, which we accept, there is no present need for granting an injunction in respect of these diversions.

Another complaint is of the diversion of water through the Wilson Supply ditch from the headwaters of Deadman Creek, a tributary of the Laramie. The substance of the complaint is (a) that there has been no appropriation under which this diversion may be made, and (b) that, even if there has been such an appropriation, the Wilson Supply ditch recently has been enlarged and is now made the means of diverting more water from the headwaters of Deadman Creek than was included in the appropriation. Neither phase of the complaint is tenable. The decree in the earlier suit (260 U. S. 1,) distinctly recognizes and confirms the existence of an appropriation enabling "the State of Colorado, or anyone recognized by her as duly entitled thereto," to divert and take from the headwaters of Deadman Creek "the relatively small

amount of water appropriated therefrom prior to the year 1902 by and through what is designated in the evidence as the Wilson Supply ditch". Wyoming is bound by this finding and adjudication. While the appropriation is there described as including a "relatively small amount of water" the record in that suit, to which the decree refers, shows that the appropriation is of 2,000 acre feet of water per annum—a relatively small amount when contrasted with the other appropriations of 18,000 and 4,250 acre feet which the decree recognizes in its next preceding parts. The decree is to be taken as if the exact amount of this appropriation were written into it.

While the evidence bearing on the alleged enlargement of the Wilson Supply ditch is conflicting, we are persuaded by it that what was done was more in the nature of repair than of enlargement. But this is not very material; for the evidence convinces us that the water diverted from the headwaters of Deadman Creek through the ditch has not been in excess of 2,000 acre feet per annum, the amount of the recognized appropriation.

It is well to state with some emphasis that what we have just said relates to the appropriation through the Wilson Supply ditch from the headwaters of Deadman Creek. The need for this statement arises out of the fact that other water which forms no part of this appropriation but is part of the natural flow of Sand Creek, is carried by the same ditch from Sand Creek to Sheep Creek. Sand Creek lies between Deadman Creek and Sheep Creek and for a part of its length is used as a section of the Wilson Supply ditch. We are not here concerned with the diversion or appropriation of the water naturally flowing in Sand Creek.

It is further complained that the diversions made under the meadowland appropriations which are recognized and confirmed in the decree are excessive, in that, while the decree fixes the amount of these appropriations at 4,250 acre feet per annum, the actual diversions thereunder have ranged from 36,000 to 62,000 acre feet per year. In the answer Colorado does not deny that waters greatly in excess of the amount fixed in the decree are taken from the stream into ditches leading to the meadowlands where it is to be applied, but asserts that after the water is applied the greater part of it returns to the stream through surface drainage and percolation and that the part actually consumed does not exceed the amount fixed in the decree.

It is apparent from the opinion in the earlier suit that 4,250 acre feet was fixed as the measure of these appropriations because the water is appropriated for the irrigation of 4,250 acres of native-hay meadows and one acre foot per acre is deemed sufficient for that purpose when the water is rightly and not wastefully applied.

The evidence shows that the water is being applied to the native-hay meadows by a process of continuous flooding whereby 10 or more acre feet are put on each acre during the irrigating season of 50 or 60 days. That this is a distinctly wasteful process is obvious. It is true that when water is so applied a considerable portion ultimately finds its way back into the stream unless the place of application be remote from the stream or in another water-shed, which is not the case in this instance. But it is also true that a material percentage of the water is lost by evaporation and other natural processes and that there is no way of determining with even approximate certainty how much of the water returns to the stream.

Colorado insists that the decree, in fixing the measure of these meadowland appropriations, refers to the amount of water consumptively used and not to the amount taken from the stream into the ditches leading to the place of use. The thing dealt with by the decree is described therein as the right "to divert and take" from the stream and its tributaries a designated amount of water. We think these words refer to the water taken from the stream at the point of diversion, and not to the variable and uncertain part of it that is consumptively used.

As it is plainly shown that diversions are being made under these meadowland appropriations in quantities largely in excess of the amount fixed in the decree, we think an injunction should issue forbidding further departures from the decree in this regard.

Another complaint is that the diversions under the Skyline ditch appropriation and those under the Laramie-Poudre tunnel appropriation have been and are in excess of the quantities accredited to them by the decree. In the answer Colorado admits the charge in respect of the Skyline ditch appropriation; denies that the diversions under the Laramie-Poudre tunnel appropriation have been in excess of the quantity accredited to it; and asserts that, with the possible exception of the year 1929, the total diversions under the recognized Colorado appropriations have been at all times within the aggregate of the quantities accredited to them

severally, and that, consistently with the decree, she lawfully may permit diversions under any of the recognized appropriations in excess of its accredited quantity so long as the total diversions under all do not exceed the aggregate of the quantities accredited to them severally. It is a necessary conclusion from the answer that all of the actual diversions have been made with Colorado's permission express or implied.

The evidence respecting diversions under the Skyline ditch appropriation and under the tunnel appropriation is conflicting; and this is true of the evidence respecting the total diversions under the recognized Colorado appropriations. After considering all of it, and such admissions as are made in the answer, we reach the conclusion that the diversions under the Skyline ditch appropriation have exceeded the quantity named in the decree, the excess ranging from 1,000 to 5,000 acre feet per year; that the diversions under the tunnel appropriation have closely approached, but have not exceeded, the quantity fixed in the decree; that the total diversions under the recognized Colorado appropriations, including those for the meadowlands, have uniformly exceeded the aggregate of the quantities which the decree accredits to them severally; and that, if the appropriations and the diversions for the meadowlands be put aside, the total diversions under the other appropriations have at times closely approached, but at no time have exceeded, the aggregate of the quantities accredited to them as distinct appropriations.

We already have dealt with the excessive diversions under the meadowland appropriations and have said that an injunction will be granted forbidding any further departure from the decree in that regard. That injunction will eliminate the excess in those diversions; and when that is done the total diversions under the several appropriations will be, as has just been pointed out, within the aggregate of the quantities which are accredited to them severally by the earlier decree—and this notwithstanding the diversions under the Skyline ditch appropriations are in excess of the quantity accredited to it.

We therefore must consider the contention made by Colorado that, consistently with the decree, she lawfully may permit diversions under any of the recognized appropriations in excess of its accredited quantity, so long as the total diversions under all do not exceed the aggregate of the quantities accredited to them severally.

In both Colorado and Wyoming water rights acquired by appropriation are transferable, in whole or in part, either permanently or temporarily; and the use of the water may be changed from the irrigation of one tract to the irrigation of another, if the change does not injure other appropriators.[1] The rules in this regard are but incidental to the doctrine of appropriation. That doctrine prevails in both States and the decree in the earlier suit was based on it. It was not the purpose of that suit or of the decree to withdraw water claims dealt with therein from the operation of local laws relating to their transfer or to restrict their utilization in ways not affecting the rights of one State and her claimants as against the other State and her claimants.

We perceive no reason for thinking that it is in any wise material to Wyoming and her water claimants whether the water in question is diverted and conveyed to the place of use through the Skyline ditch, the Wilson Supply ditch or the ditches of the Laramie-Poudre Tunnel Project. All are trans-mountain ditches and deliver the water in the Cache La Poudre Valley, which is in another watershed.

The diversions through the trans-mountain ditches in the quantities here shown are made with the consent of the owners of the water rights and with the full sanction of Colorado. Therefore as respects the present question the situation is not different from what it would be had the owners of the other claims formally transferred parts of their water rights to the Skyline owners. The appropriations remain as they were when the decree was entered and are still limited to the quantities which it accredits to them. But the Skyline owners are now permitted by the owners of the other claims and by Colorado to take and use part of the waters included in those claims. Wyoming and her claimants are in no way injured by this. No departure from the decree is involved. The thing which the decree recognizes and confirms is "the right of the State of Colorado, *or of any one recognized by her as duly entitled thereto*, . . . to divert and take" the water included in the designated appropriations.

---

[1] Sieber *v.* Frink, 7 Colo. 148, 154; Strickler *v.* Colorado Springs, 16 Colo. 61, 68, *et seq.*; Frank *v.* Hicks, 4 Wyo. 502, 523; McPhail *v.* Forney, 4 Wyo. 556, 560; Johnston *v.* Little Horse Creek Irrigating Co., 13 Wyo. 208, 225, *et seq.*

We are accordingly of opinion that in the circumstances here shown the Skyline ditch diversions do not constitute an infraction of the decree.

In the brief for Wyoming we are asked to adjudicate the relative rights of the two States and of their respective citizens to divert and use the waters of Sand Creek, a small interstate stream, which is not a tributary of the Laramie. (259 U. S. 490.) The bill contains no showing in respect of these rights, there is no prayer in it for their adjudication, and they are not relevant to the controversy which it presents. We therefore must decline to consider them at this time.

In the bill it is complained that Colorado, although requested so to do, has refused to permit Wyoming to install measuring devices at the places of diversion for the purpose of ascertaining the amount of water being diverted in Colorado from the river and its tributaries, and there is a prayer for a decretal order permitting such installation. The evidence bearing on this matter hardly can be regarded as establishing the propriety of such an order, and yet it tends to show a need for improving the means and methods of measuring the diversions, for keeping accurate and complete records thereof, and for according to the representatives of Wyoming full access to both the measuring devices and the records. Recognizing this need, Colorado in her brief assures us that through her officers she will accord to Wyoming's officers free access to the measuring devices and to the registering charts, records, and other available data, will cooperate freely with them in devising an appropriate plan for measuring the diversions, and will give full consideration to such suggestions as they may make respecting the improvement of the measuring equipment. In this situation the order which is asked would be inappropriate. While the problem of measuring and recording the diversions is a difficult one, we entertain the hope that the two States will by cooperative efforts accomplish a satisfactory solution of it. But we think Wyoming should have leave to apply to us for an appropriate order in the matter if the two States are unable to agree and it is found that there is real need for invoking action by us.

For the reasons given in this opinion we conclude that the only relief to which Wyoming is now entitled is an injunction forbidding further diversions under the meadowland appropriations

of more than 4,250 acre feet per year measured at the headgates through which the water is diverted.

Such an injunction will be granted, Wyoming will be given leave to apply later on for an appropriate order respecting the measurement and recording of all diversions in the event the two States are unable to agree and there is need for action by this Court, jurisdiction of the cause will be retained for the purposes of such an application, and the costs will be taxed one-half to each of the two States.

It is so ordered.

A true copy.
